Rifamycin Derivatives: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Sildenafil: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

St Johns Wort: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): HMG-CoA Reductase Inhibitors may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Consumption of large amounts of ethanol may increase the risk of liver damage with HMG-CoA reductase inhibitors. Concurrent ingestion of ethanol may increase the risk of flushing associated with niacin.

Food: Simvastatin serum concentrations may be increased when taken with grapefruit juice; avoid concurrent intake of large quantities (>1 quart/day). Red yeast rice contains an estimated 2.4 mg lovastatin per 600 mg rice. Concurrent ingestion of hot liquids or spicy foods may increase the risk of niacin associated flushing.

Herb/Nutraceutical: St John's wort may decrease simvastatin levels.

Test InteractionsFalse elevations in some fluorometric determinations of urinary catecholamines; false-positive urine glucose (Benedict's reagent)

Monitoring ParametersBlood glucose, CBC, LFTs, prothrombin time (surgical patients), and serum phosphorus. Baseline CK levels, hepatic transaminase levels, and total cholesterol profile should be obtained prior to initiation of therapy. Repeat CK level with onset of unexplained muscle symptoms. Repeat hepatic transaminase levels every 12 weeks for first 6 months and periodically thereafter (approximately every 6 months).

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsBlood glucose, CBC, LFTs, prothrombin time (surgical patients), and serum phosphorus. Baseline CK levels, hepatic transaminase levels, and total cholesterol profile should be obtained prior to initiation of therapy. Repeat CK level with onset of unexplained muscle symptoms. Repeat hepatic transaminase levels every 12 weeks for first 6 months and periodically thereafter (approximately every 6 months).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, variable release:

Simcor®:

500/20: Niacin 500 mg [extended release] and simvastatin 20 mg [immediate release]

750/20: Niacin 750 mg [extended release] and simvastatin 20 mg [immediate release]

1000/20: Niacin 1000 mg [extended release] and simvastatin 20 mg [immediate release]

Generic AvailableNo

ManufacturerAbbott Laboratories

Pricing: U.S. (www.drugstore.com)

Tablet, 24-hour (Simcor)

500-20 mg (90): $199.29

Mechanism of Action

Niacin is a component of two coenzymes which is necessary for tissue respiration, lipid metabolism, and glycogenolysis; inhibits the synthesis of very low density lipoproteins.

Simvastatin is a derivative of lovastatin that acts by competitively inhibiting 3-hydroxy-3-methylglutaryl-coenzyme A (HMG-CoA) reductase, the enzyme that catalyzes the rate-limiting step in cholesterol biosynthesis.

Pharmacodynamics/KineticsSee individual agents.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause depression, dizziness, nervousness, or insomnia

Mental Health: Effects on Psychiatric TreatmentModerate-to-strong inhibitors of CYP3A4 (eg, nefazodone, caffeine, desipramine, haloperidol, sertraline, and verapamil) may elevate simvastatin levels and the risk of myopathy and renal failure. St John's wort may decrease simvastatin levels; monitor.

Cardiovascular ConsiderationsNiacin lowers LDL-cholesterol (LDL-C) and triglycerides (TGs) and increases HDL-cholesterol (HDL-C). It causes a shift from small, dense to large, buoyant LDL particles that are less atherogenic. Niacin also significantly lowers lipoprotein A levels.

Primary Prevention: HMG-CoA reductase inhibitors are effective in primary and secondary prevention of cardiovascular events in patients with hyperlipidemia. For primary prevention, a patient's major risk factors (cigarette smoking, hypertension or currently taking antihypertensives, low HDL-C, family history, age, gender) should be evaluated. Patients with multiple risk factors (≥2) require more intensive therapy guided by the calculation of a 10-year absolute CHD risk (eg, the percent probability of having a CHD event in next 10 years). An individual's 10-year absolute CHD risk can be calculated at www.med-decisions.com/cvtool/phys/phys.html. LDL cholesterol goals, therapeutic lifestyle changes, and drug therapy are determined based upon a patient's risk factor profile.

Primary prevention trials show that cholesterol-lowering drugs reduce the risk of major coronary events, coronary death, and cerebrovascular events even in the first 6-12 months of use. The WOSCOP trial suggested a trend towards enhanced survival using pravastatin in their patients (mean LDL-cholesterol of 192 mg/dL and no history of MI). In a recent trial (Sever, 2003), patients with HTN and at least three other risk factors were randomized to 10 mg daily of atorvastatin or placebo. These patients had a total nonfasting cholesterol <250 mg/dL before treatment. LDL-C levels were 132 mg/dL before treatment and fell to an average of 90 mg/dL in the atorvastatin-treated group. There was a significant reduction in stroke, cardiovascular events, and coronary events in the atorvastatin-treated group as compared to the placebo group. There was no difference in mortality between the groups.

HMG-CoA reductase inhibitors decrease C-reactive protein (CRP), an inflammatory marker and an acute phase reactant. Elevated levels of high sensitive CRP (hsCRP), which detects CRP levels as low as 0.175 mg/L, have been shown to be associated with an increased risk of cardiovascular events. Recently, the JUPITER trial demonstrated that the use of rosuvastatin in healthy patients (men ≥50 years and women ≥60 years) without a history of cardiovascular disease with LDL <130 mg/dL and a hsCRP level ≥2 mg/L reduced the risk of major cardiovascular events (eg, nonfatal MI, stroke, death from cardiovascular causes), The number needed to treat over 5 years to prevent 1 cardiovascular event is 25. Current guidelines do not recommend drug treatment for patients with an LDL <130 mg/dL. However, identification of the patient at higher risk of cardiovascular events within this subgroup using hsCRP is now important given that statins may prevent the occurrence of these serious cardiovascular events (Ridker, 2008).

Secondary prevention: Secondary prevention trials indicate that “statin” therapy reduces mortality, major coronary events, coronary artery procedures, and stroke. The Heart Protection Study proved that lowering serum cholesterol levels reduces the rate of major vascular events among high-risk individuals with documented vascular disease (CHD, cerebrovascular, peripheral vascular) or diabetes regardless of initial cholesterol concentrations. PROVE IT is a randomized, double-blind trial evaluating hospitalized patients with acute coronary syndrome to determine the effects of intense LDL-C lowering therapy. Four thousand patients with an LDL-C levels of 106 mg/dL were randomized to pravastatin 40 mg daily or atorvastatin 80 mg daily. After 2 years, the combined cardiovascular endpoint (death, MI, unstable angina requiring hospitalization, revascularization and stroke) was ~26% in the pravastatin patients (median LDL-C 95 mg/dL) and ~22% in the atorvastatin treated patients (median LDL-C 62 mg/dL).

LaRosa and colleagues assessed the efficacy and safety of lowering LDL cholesterol <100 mg/dL in patients with stable coronary heart disease (LaRosa, 2005). Ten thousand and one patients with baseline LDL levels <130 mg/dL were randomized to atorvastatin 10 mg or 80 mg daily and followed for a median of 4.9 years. The primary endpoint was the occurrence of the first major cardiovascular event (death from CVD, MI, resuscitation after cardiac arrest, or stroke). A primary event occurred in 434 patients (8.7%) receiving 80 mg daily (mean LDL 77 mg/dL) and 548 patients (10.9%) receiving 10 mg dose (mean LDL 101 mg/dL) (95% CI, 0.69-0.89; $p < 0.001$). There was no mortality difference between the two treatment groups.

In addition to the ability of HMG-CoA reductase inhibitors to decrease levels of high-sensitivity C-reactive protein (hs-CRP), they also possess pleiotropic properties including improved endothelial function, reduced inflammation at the site of the coronary plaque, inhibition of platelet aggregation, and anticoagulant effects. These nonlipid effects may be beneficial when HMG-CoA reductase inhibitors are introduced early in the management of acute coronary syndromes (de Denus, 2002).

Myopathy: Currently-marketed HMG-CoA reductase inhibitors appear to have a similar potential for causing myopathy. Incidence of severe myopathy is about 0.08% to 0.09%. The factors that increase risk include advanced age (especially >80 years of age), women more frequently than men, small body frame, frailty, multisystem disease (eg, chronic renal insufficiency especially due to diabetes), multiple medications, drug interactions (use with caution or avoid). The combination of a HMG-CoA reductase inhibitor plus nicotinic acid seems to carry a lower risk of myopathy than does a HMG-CoA reductase inhibitor plus a fibrate. Other medications, when used concurrently, may enhance the risk of myopathy associated with statins; these include drugs that inhibit CYP3A4 isoenzymes (lovastatin, simvastatin, atorvastatin) or CYP2C9 isoenzymes (fluvastatin). HMG-CoA reductase inhibitors may exacerbate exercise-induced skeletal muscle injury. Many experts favor getting a baseline creatine kinase (CK) measurement before initiating therapy (asymptomatic CK elevations are common). Obtain a CK measurement if patient complains of muscle soreness, tenderness, or pain.

Index TermsSimvastatin and Niacin

Medication Safety Issues

Sound-alike/look-alike issues:

Niacin may be confused with Minocin®, Niaspan®, Nispan®

Niaspan® may be confused with niacin

Nicobid® may be confused with Nitro-Bid®

International issues:

Niacor® may be confused with Nacor® which is a brand name for enalapril in Spain

Pronunciation(NYE a sin)

U.S. Brand NamesNiacin-Time®; Niacor®; Niaspan®; Slo-Niacin® [OTC]

Canadian Brand NamesNiaspan®

Pharmacologic CategoryAntilipemic Agent, Miscellaneous; Vitamin, Water Soluble

Use: Labeled IndicationsAdjunctive treatment of dyslipidemias (types IIa and IIb or primary hypercholesterolemia) to lower the risk of recurrent MI and/or slow progression of coronary artery disease, including combination therapy with other antidyslipidemic agents when additional triglyceride-lowering or HDL-increasing effects are desired; treatment of hypertriglyceridemia in patients at risk of pancreatitis; treatment of peripheral vascular disease and circulatory disorders; treatment of pellagra; dietary supplement

Dosing: Adults**Note:** Formulations of niacin (regular release versus extended release) are not interchangeable.

Recommended daily allowances:

Male: 25-50 years: 19 mg/day; >51 years: 15 mg/day

Female: 25-50 years: 15 mg/day; >51 years: 13 mg/day

Hyperlipidemia: Oral: Usual target dose: Regular release: 1.5-6 g/day in 3 divided doses with or after meals using a dosage titration schedule; extended release: 500 mg to 2 g once daily at bedtime

Regular release formulation (Niacor®): Initial: 250 mg once daily (with evening meal); increase frequency and/or dose every 4-7 days to desired response or first-level therapeutic dose (1.5-2 g/day in 2-3 divided doses); after 2 months, may increase at 2- to 4-week intervals to 3 g/day in 3 divided doses (maximum dose: 6 g/day in 3 divided doses)

Extended release formulation (Niaspan®): Initial: 500 mg at bedtime for 4 weeks, then 1 g at bedtime for 4 weeks; adjust dose to response and tolerance; can increase to a maximum of 2 g/day, but only at 500 mg/day at 4-week intervals

With lovastatin: Recommended initial dose: 20 mg/day; Maximum lovastatin dose: 40 mg/day

Pellagra: Oral: 50-100 mg 3-4 times/day, maximum: 500 mg/day

Niacin deficiency: Oral: 10-20 mg/day, maximum: 100 mg/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Formulations of niacin (regular release versus extended release) are not interchangeable.

Pellagra: Oral: Children: 50-100 mg/dose 3 times/day

Recommended daily allowances:

0-0.5 years: 5 mg/day

0.5-1 year: 6 mg/day

1-3 years: 9 mg/day

4-6 years: 12 mg/day

7-10 years: 13 mg/day

RDA: Children and Adolescents:

Male:

11-14 years: 17 mg/day

    15-18 years: 20 mg/day

    19-24 years: 19 mg/day

  Female: 11-24 years: 15 mg/day

Dosing: Renal ImpairmentUse with caution.
Dosing: Hepatic ImpairmentContraindicated in patients with significant or unexplained hepatic dysfunction, active liver disease or unexplained transaminase elevations.
Dosing: Adjustment for ToxicityHepatic toxicity: Transaminases rise ≥3 times ULN, either persistent or if symptoms of nausea, fever, and/or malaise occur: Discontinue therapy.
Administration: OralAdminister with food. Administer Niaspan® at bedtime. Niaspan® tablet strengths are not interchangeable. When switching from immediate release tablet, initiate Niaspan® at lower dose and titrate. Long-acting forms should not be crushed, broken, or chewed. Do not substitute long-acting forms for immediate release ones.
Dietary ConsiderationsShould be taken with meal; low-fat meal if treating hyperlipidemia. Avoid hot drinks around the time of niacin dose.
Storage

Niaspan®: Store at room temperature of 20°C to 25°C (68°F to 77°F).

Niacor®: Store at controlled room temperature of 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to niacin, niacinamide, or any component of the formulation; active hepatic disease or significant or unexplained hepatic dysfunction; active peptic ulcer; arterial hemorrhage
Allergy Considerations

- Niacin and Derivatives Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Flushing: Common and can be attenuated with a gradual increase in dose, and/or by taking aspirin or an NSAID 30-60 minutes before dosing. Compliance is enhanced with twice daily dosing.

- Hepatotoxicity: Cases of severe hepatotoxicity, including fulminant hepatic necrosis, have occurred when immediate release (crystalline) niacin products have been substituted with sustained-release (modified release, timed-release) niacin products at equivalent doses. Patients should be initiated with low doses (eg, 500 mg at bedtime) with titration to achieve desired response. Liver function tests should be monitored in all patients receiving lipid-lowering doses of niacin.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with unstable angina or MI.

- Diabetes: Use niacin with caution in patients with diabetes mellitus; niacin may increase fasting blood glucose, although clinical data suggest increases are generally modest (<5%). Monitor glucose; adjustment of hypoglycemic therapy may be necessary.

- Gallbladder disease: Use with caution in patients with active gallbladder disease; can exacerbate.

- Gout: Use may be associated with hyperuricemia. Use with caution in patients with gout.

- Hepatic impairment: Use with caution in patients with a past history of hepatic impairment; monitor liver function tests. Contraindicated with active liver disease or unexplained transaminase elevation.

- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- Anticoagulants: Use with caution in patients taking anticoagulants; may slightly increase prothrombin time.

- HMG-CoA reductase inhibitors: Rare cases of rhabdomyolysis have occurred during concomitant use with HMG-CoA reductase inhibitors; with concurrent use or if symptoms suggestive of myopathy occur, monitor creatinine phosphokinase (CPK) and potassium.

Special populations:

- Heavy ethanol users: Use with caution in heavy ethanol users.

Dosage form specific issues:

- Product interchangeability: **Note:** Formulations of niacin (regular release versus extended release) are not interchangeable; the bioavailability varies.

Other warnings/precautions:

- Appropriate use: Prior to initiation, secondary causes for hypercholesterolemia (eg, poorly controlled diabetes mellitus, hypothyroidism) should be excluded; management with diet and other nonpharmacologic measures (eg, exercise or weight reduction) should be attempted prior to initiation.

Geriatric ConsiderationsThe definition of and, therefore, when to treat hyperlipidemia in the elderly is a controversial issue. The National Cholesterol Education Program recommends that all adults maintain a plasma cholesterol <160 mg/dL. Elderly with one additional risk factor, goal LDL would be <130 mg/dL. It is the authors' belief that pharmacologic treatment be reserved for those who are unable to obtain a desirable plasma cholesterol concentration by diet alone and for whom the benefits of treatment are believed to outweigh the potential adverse effects, drug interactions, and cost of treatment.

Pregnancy Risk FactorA/C (dose exceeding RDA recommendation)

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. It is unknown whether or not niacin at lipid-lowering doses is harmful to the developing fetus. If a woman becomes pregnant while receiving niacin for primary hypercholesterolemia, niacin should be discontinued. If a woman becomes pregnant while receiving niacin for hypertriglyceridemia, the benefits and risks of continuing niacin should be assessed on an individual basis.

LactationEnters breast milk/consult prescriber

Breast-Feeding ConsiderationsNiacin is excreted in human breast milk. Because lipid-lowering doses of niacin may cause serious adverse reactions in nursing infants, a decision should be made whether to discontinue nursing or discontinue the drug, taking into account the importance of the drug to the mother.

Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmias, atrial fibrillation, edema, flushing, hypotension, orthostasis, palpitation, syncope (rare), tachycardia

Central nervous system: Chills, dizziness, headache, insomnia, migraine, nervousness, pain

Dermatologic: Acanthosis nigricans, dry skin, hyperpigmentation, maculopapular rash, pruritus, rash, urticaria

Endocrine & metabolic: Glucose tolerance decreased, gout, phosphorous levels decreased, hyperuricemia

Gastrointestinal: Abdominal pain, diarrhea, dyspepsia, eructation, flatulence, nausea, peptic ulcers, vomiting

Hematologic: Platelet counts decreased

Hepatic: Hepatic necrosis (rare), jaundice, transaminases increased (dose-related), prothrombin time increased

Neuromuscular & skeletal: Leg cramps, myalgia, myasthenia, myopathy (with concurrent HMG-CoA reductase inhibitor), paresthesia, rhabdomyolysis (with concurrent HMG-CoA reductase inhibitor; rare), weakness

Ocular: Cystoid macular edema, toxic amblyopia

Respiratory: Dyspnea

Miscellaneous: Diaphoresis, hypersensitivity reactions (rare)

Drug Interactions

Bile Acid Sequestrants: May decrease the absorption of Niacin. *Risk D: Consider therapy modification*

HMG-CoA Reductase Inhibitors: Niacin may enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid heavy use; avoid use around niacin dose.

Test InteractionsFalse elevations in some fluorometric determinations of plasma or urinary catecholamines; false-positive urine glucose (Benedict's reagent)

Monitoring ParametersBlood glucose (in diabetic patients); CPK and serum potassium (if on concurrent HMG-CoA reductase inhibitor); liver function tests pretreatment, every 6-12 weeks for first year, then periodically (approximately every 6 months), monitor liver function more frequently if history of transaminase elevation with prior use; lipid profile; platelets; PT (if on anticoagulants); uric acid (if predisposed to gout); phosphorus (if predisposed to hypophosphatemia)

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for increased risk of drug/drug interactions. Teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsBlood glucose (in diabetic patients); CPK and serum potassium (if on concurrent HMG-CoA reductase inhibitor); liver function tests pretreatment, every 6-12 weeks for first year, then periodically (approximately every 6 months), monitor liver function more frequently if history of transaminase elevation with prior use; lipid profile; platelets; PT (if on anticoagulants); uric acid (if predisposed to gout); phosphorus (if predisposed to hypophosphatemia)

Patient EducationTake exactly as directed; do not exceed recommended dosage. Take with food to reduce incidence of GI upset. Do not crush sustained release capsules. You may experience flushing, sensation of heat, or headache; these reactions may be decreased by increasing dose slowly or by taking aspirin (consult prescriber) 30-60 minutes prior to taking niacin. Avoid alcohol or hot drinks around time of taking medication to minimize flushing. Taking at bedtime, after a low-fat snack, is also recommended. You may experience dizziness, lightheadedness (use caution when driving or engaging in tasks requiring alertness until response to drug is known). Report persistent GI disturbance or changes in color of urine or stool. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Consult prescriber if breast-feeding

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, extended release: 125 mg, 250 mg, 400 mg, 500 mg

Capsule, timed release: 250 mg, 500 mg

Tablet: 50 mg, 100 mg, 250 mg, 500 mg

Niacor®: 500 mg

Tablet, controlled release (Slo-Niacin®): 250 mg, 500 mg, 750 mg

Tablet, extended release (Niaspan®): 500 mg, 750 mg, 1000 mg

Tablet, timed release: 250 mg, 500 mg, 750 mg, 1000 mg

Niacin-Time®: 500 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablet, controlled release (Niaspan)

500 mg (30): $72.38

750 mg (30): $101.35

1000 mg (30): $126.91

Tablet, controlled release (Slo-Niacin)

Tablets (Niacin)

500 mg (100): $11.99

Mechanism of ActionComponent of two coenzymes which is necessary for tissue respiration, lipid metabolism, and glycogenolysis; inhibits the synthesis of very low density lipoproteins (VLDL) and low density lipoproteins (LDL); may also increase the rate of chylomicron triglyceride removal from plasma.

Pharmacodynamics/Kinetics

Absorption: Rapid and extensive (60% to 76%)

Distribution: Mainly to hepatic, renal, and adipose tissue

Metabolism: Extensive first-pass effects; converted to nicotinamide adenine dinucleotide, nicotinuric acid, and other metabolites

Half-life elimination: 20-45 minutes

Time to peak, serum: Immediate release formulation: 30-60 minutes; extended release formulation: 4-5 hours

Excretion: Urine 60% to 88% (unchanged drug and metabolites)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, insomnia, or nervousness

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsNiacin lowers LDL-cholesterol (LDL-C) and triglycerides (TGs) and increases HDL-cholesterol (HDL-C). It causes a shift from small, dense to large, buoyant LDL particles that are less atherogenic. Niacin also significantly lowers lipoprotein A levels. Immediate-release niacin may cause itching, flushing, headache and requires frequent daily dosing. Adverse effects may be attenuated by increasing the dose slowly and/or by taking aspirin 30-60 minutes before dosing. Compliance is enhanced with twice daily dosing. Extended release niacin may offer lipoprotein benefits similar to immediate-release dosage forms with less flushing and once daily dosing. Sustained release products may be less efficacious and cause an increased incidence of hepatotoxicity.

Medication Safety Issues

Sound-alike/look-alike issues:

Niacinamide may be confused with niCARdipine

Pronunciation(nye a SIN a mide)
U.S. Brand NamesNicomide-T™
Pharmacologic CategoryVitamin, Water Soluble
Use: Labeled Indications

Oral: Prophylaxis and treatment of pellagra

Topical: Improve the appearance of acne and decrease visible inflammation and irritation caused by acne medications

Dosing: Adults

Pellagra: Oral: 300-500 mg/day

Acne: Topical: Apply to affected area on face twice daily

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Pellagra: Oral: Children: 100-300 mg/day in divided doses

Administration: TopicalPrior to using cream or gel, wash face with mild cleanser. Apply thin layer to affected area. May apply under make-up or other acne medications. Re-evaluate after 8-12 weeks.
ContraindicationsHypersensitivity to niacin, niacinamide, or any component of the formulation; liver disease; active peptic ulcer
Allergy Considerations

- Niacin and Derivatives Allergy

Warnings/Precautions

Disease-related concerns:

- Allergies: Use with caution in patients with allergies.
- Cardiovascular disease: Use with caution in patients with unstable angina or CAD; risk of arrhythmias at high doses.
- Diabetes: Use with caution in patients with diabetes mellitus; interferes with glucose control.
- Gallbladder disease: Use with caution in patients with active gallbladder disease; can exacerbate.
- Gout: Use with caution in patients predisposed to gout.
- Hepatic impairment: Avoid large pharmacological amounts in patients with a history of liver disease; monitor liver function tests with high doses.
- Renal impairment: Use with caution in patients with renal impairment.

Special populations:

- Heavy ethanol users: Use with caution in heavy ethanol users.

Geriatric ConsiderationsShould not be confused with niacin.
Pregnancy Risk FactorA/C (dose exceeding RDA recommendation)
Adverse ReactionsFrequency not defined.

Cardiovascular: Tachycardia

Dermatologic: Increased sebaceous gland activity, rash

Endocrine & metabolic: Hyperglycemia, hyperuricemia

Gastrointestinal: Bloating, flatulence, nausea

Neuromuscular & skeletal: Paresthesia in extremities

Ocular: Blurred vision

Respiratory: Wheezing

Drug Interactions

HMG-CoA Reductase Inhibitors: Niacinamide may enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Test InteractionsFalse elevations of urinary catecholamines in some fluorometric determinations
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream (Nicomide-T™): 4% (30 g) [contains benzyl alcohol]

Gel (Nicomide-T™): 4% (30 g) [contains alcohol]

Tablet: 100 mg, 250 mg, 500 mg

Generic AvailableYes: Tablet
Pricing: U.S. (www.drugstore.com)

Cream (Nicomide-T)

4% (30): $42.99

Gel (Nicomide-T)

4% (30): $45.99

Mechanism of ActionUsed by the body as a source of niacin; is a component of two coenzymes which is necessary for tissue respiration, lipid metabolism, and glycogenolysis; does not have hypolipidemia or vasodilating effects. Niacinamide has anti-inflammatory properties which are believed to help decrease inflammatory acne lesions.
Pharmacodynamics/Kinetics

Absorption: Oral: Rapid; Topical: Absorbed systemically

Metabolism: Hepatic

Half-life elimination: 45 minutes

Time to peak, serum: 20-70 minutes

Excretion: Urine (as metabolites)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsNicotinamide; Nicotinic Acid Amide; Vitamin B_3

NiCARdipine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

NiCARdipine may be confused with niacinamide, NIFEdipine, niMODipine

Cardene® may be confused with Cardizem®, Cardura®, codeine

International issues:

Cardene® may be confused with Cardem® which is a brand name for celiprolol in Spain

Cardene® may be confused with Cardin® which is a brand name for methyldopa in Brazil and a brand name for simvastatin in Poland

Significant differences exist between oral and I.V. dosing. Use caution when converting from one route of administration to another.

Pronunciation(nye KAR de peen)

U.S. Brand NamesCardene®; Cardene® I.V.; Cardene® SR

Pharmacologic CategoryCalcium Channel Blocker

Use: Labeled IndicationsChronic stable angina (immediate-release product only); management of hypertension (immediate and sustained release); parenteral only for short-term use when oral treatment is not feasible

Use: Unlabeled/InvestigationalCongestive heart failure, control of blood pressure in acute ischemic stroke and spontaneous intracranial hemorrhage, postoperative hypertension associated with carotid endarterectomy, perioperative hypertension, prevention of migraine headaches, subarachnoid hemorrhage associated cerebral vasospasm

Dosing: Adults

Angina: Immediate release: Oral: 20 mg 3 times/day; usual range: 60-120 mg/day; increase dose at 3-day intervals

Hypertension: Oral:

Immediate release: Initial: 20 mg 3 times/day; usual: 20-40 mg 3 times/day (allow 3 days between dose increases)

Sustained release: Initial: 30 mg twice daily, titrate up to 60 mg twice daily

Note: The total daily dose of immediate-release product may not automatically be equivalent to the daily sustained-release dose; use caution in converting.

Acute hypertension: I.V.: Initial: 5 mg/hour increased by 2.5 mg/hour every 15 minutes to a maximum of 15 mg/hour; consider reduction to 3 mg/hour after response is achieved. Monitor and titrate to lowest dose necessary to maintain stable blood pressure.

Substitution for oral therapy (approximate equivalents):

20 mg every 8 hours oral, equivalent to 0.5 mg/hour I.V. infusion

30 mg every 8 hours oral, equivalent to 1.2 mg/hour I.V. infusion

40 mg every 8 hours oral, equivalent to 2.2 mg/hour I.V. infusion

Dosing: ElderlyInitiate at the low end of the dosage range. Specific guidelines for adjustment of nicardipine are not available, but careful monitoring is warranted and adjustment may be necessary.

Dosing: Renal ImpairmentTitrate dose beginning with 20 mg 3 times/day (immediate release) or 30 mg twice daily (sustained release capsule). Specific guidelines for adjustment of nicardipine are not available, but careful monitoring is warranted and adjustment may be necessary.

Dosing: Hepatic ImpairmentStarting dose: 20 mg twice daily (immediate release) with titration. Refer to "Note" in adult dosing. Specific guidelines for adjustment of nicardipine are not available, but careful monitoring is warranted and adjustment may be necessary.

Administration: I.V.

Ampuls must be diluted before use. Administer as a slow continuous infusion.

Premixed bags: No further dilution needed. For single use only, discard any unused portion. Use only if solution is clear; the manufacturer recommends not to admix or run in the same line as other medications.

Administration: I.V. DetailAvoid extravasation.

pH: 3.5 (buffered)

Administration: OralDo not chew or crush the sustained release formulation, swallow whole. Do not open or cut capsules.

Storage

I.V.:

Premixed bags: Store at controlled room temperature of 20°C to 25°C (68°F to 77°F) . Protect from light and excessive heat. Do not freeze.

Vials: Store at controlled room temperature of 20°C to 25°C (68°F to 77°F). Diluted solutions are stable for 24 hours at room temperature. Protect from light.

Oral (Cardene®, Cardene SR®): Store at 15°C to 30°C (59°F to 86°F). Protect from light. Freezing does not affect stability.

ReconstitutionI.V.: Vial: Dilute 25 mg ampul with 240 mL of compatible solution to provide a 250 mL total volume solution and a final concentration of 0.1 mg/mL.

CompatibilityStable in D$_5$W with KCl 40 mEq, D$_5{}^1/_2$NS, D$_5$NS, D$_5$W, $^1/_2$NS, NS; **incompatible** with sodium bicarbonate 5%, LR.

Y-site administration: Compatible: Amikacin, aminophylline, aztreonam, butorphanol, calcium gluconate, cefazolin, ceftizoxime, chloramphenicol, cimetidine, clindamycin, diltiazem, dobutamine, dopamine, enalaprilat, epinephrine, erythromycin, esmolol, famotidine, fenoldopam, fentanyl, gatifloxacin, gentamicin, hydrocortisone sodium succinate, hydromorphone, labetalol, lidocaine, linezolid, lorazepam, magnesium, methylprednisolone sodium succinate, metronidazole, midazolam, milrinone, morphine, nafcillin, nitroglycerin, nitroprusside, norepinephrine, penicillin G potassium, potassium chloride, potassium phosphate, ranitidine, sodium acetate, sulfamethoxazole and trimethoprim, tobramycin, vancomycin, vecuronium. **Incompatible:** Ampicillin, ampicillin/sulbactam, cefepime, furosemide, lansoprazole, thiopental. **Variable (consult detailed reference):** Ceftazidime, heparin.

Compatibility when admixed: Compatible: Potassium chloride.

ContraindicationsHypersensitivity to nicardipine or any component of the formulation; advanced aortic stenosis

Allergy Considerations

- Calcium Channel Blocker, Dihydropyridine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Angina/MI: Increased angina and/or MI has occurred with initiation or dosage titration of dihydropyridine calcium channel blockers; reflex tachycardia may occur resulting in angina and/or MI in patients with obstructive coronary disease especially in the absence of concurrent beta blockade.
- Hypotension/syncope: Symptomatic hypotension with or without syncope can rarely occur; blood pressure must be lowered at a rate appropriate for the patient's clinical condition.
- Peripheral edema: A common side effect is peripheral edema (dose-dependent); occurs within 2-3 weeks of starting therapy.

Disease-related concerns:

- Aortic stenosis: Use with caution in patients with severe aortic stenosis; may reduce coronary perfusion resulting in ischemia.
- Heart failure (HF): Use with caution in patients with HF. Use in patients with severe left ventricular dysfunction, particularly with concomitant beta-blockade, may experience worsened symptoms of HF due to mild negative inotropic effects of nicardipine.
- Hepatic impairment: Use with caution in patients with hepatic impairment; may require lower starting dose.
- Hypertrophic cardiomyopathy (HCM) with outflow tract obstruction: Use with caution in patients with HCM and outflow tract obstruction since reduction in afterload may worsen symptoms associated with this condition.
- Portal hypertension: Use with caution in patients with portal hypertension, can cause increase in hepatic pressure gradient.
- Renal impairment: Increase dose cautiously in patients with renal impairment since clearance of nicardipine is diminished in this population.

Concurrent drug therapy issues:

- Fentanyl anesthesia: Concurrent fentanyl anesthesia and I.V. nicardipine (with a beta-blocker) may result in hypotension. Careful volume resuscitation may be required to overcome hypotensive effects.

Special populations:

- Elderly: Nicardipine should be initiated at the low end of the dosage range in the elderly.
- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Infusion sites: Peripheral infusion sites (for I.V. therapy) should be changed every 12 hours.
- Withdrawal: Abrupt withdrawal may cause rebound angina in patients with CAD.

Geriatric ConsiderationsElderly may experience a greater hypotensive response. Constipation may be more of a problem in the elderly. Calcium channel blockers are no more effective in the elderly than other therapies; however, they do not cause significant CNS effects which is an advantage over some antihypertensive agents.

Pregnancy Risk FactorC

Pregnancy ConsiderationsCrosses the placenta; may exhibit tocolytic effect

LactationEnters breast milk/not recommended

Adverse Reactions

1% to 10%:

Cardiovascular: Cardiovascular: Flushing (6% to 10%), peripheral edema (dose related; 6% to 8%), hypotension (I.V. 6%), increased angina (dose related; 6%), palpitation (3% to 4%), tachycardia (1% to 4%), vasodilation (1% to 5%), chest pain (I.V. 1%), ECG abnormal (I.V. 1%), extrasystoles (I.V. 1%), hemopericardium (I.V. 1%), hypertension (I.V. 1%), orthostasis (1%), supraventricular tachycardia (I.V. 1%), syncope (1%), ventricular extrasystoles (I.V. 1%), ventricular tachycardia (I.V. 1%)

Central nervous system: Headache (6% to 15%), dizziness (1% to 7%), hypoesthesia (1%), intracranial hemorrhage (1%) pain (1%), somnolence (1%)

Dermatologic: Rash (1%)

Endocrine & metabolic: Hypokalemia (I.V. 1%)

Gastrointestinal: Nausea (2% to 5%), vomiting (I.V. 5%), dyspepsia (oral 2%), abdominal pain (I.V. 1%), dry mouth (1%)

Genitourinary: Polyuria (1%)

Local: Injection site pain (I.V. 1%), injection site reaction (I.V. 1%)

Neuromuscular & skeletal: Weakness (1% to 6%), myalgia (1%), paresthesia (1%)

Renal: Hematuria (1%)

Respiratory: Dyspnea (1%)

Miscellaneous: Diaphoresis (1%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Allergic reaction, confusion, constipation, deep vein thrombophlebitis; ECG effects (AV block, inverted T wave, ST segment depression); gingival hyperplasia, hypertonia, hypophosphatemia, insomnia, malaise, nervousness, nocturia, parotitis, thrombocytopenia, tinnitus, tremor

Metabolism/Transport Effects**Substrate** of CYP1A2 (minor), 2C9 (minor), 2D6 (minor), 2E1 (minor), 3A4 (major); **Inhibits** CYP2C9 (strong), 2C19 (moderate), 2D6 (moderate), 3A4 (strong)

Drug Interactions

Alosetron: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alosetron. *Risk C: Monitor therapy*

Alpha1-Blockers: May enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Calcium Channel Blockers (Dihydropyridine). Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk C: Monitor therapy*

Calcium Salts: May diminish the therapeutic effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk C: Monitor therapy*

Ciclesonide: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ciclesonide. Specifically, concentrations of the active des-ciclesonide metabolite may be increased. *Risk C: Monitor therapy*

Clopidogrel: Calcium Channel Blockers may diminish the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CycloSPORINE: May decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). Nicardipine may likewise inhibit the metabolism of cyclosporine. Cyclosporine dosage adjustments might be needed. *Risk C: Monitor therapy*

CYP2C19 Substrates: CYP2C19 Inhibitors (Moderate) may decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Strong) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Strong) may decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Eplerenone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Eplerenone. *Risk X: Avoid combination*

FentaNYL: CYP3A4 Inhibitors (Strong) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Fesoterodine: CYP3A4 Inhibitors (Strong) may increase serum concentrations of the active metabolite(s) of Fesoterodine. Management: Avoid fesoterodine doses greater than 4mg daily in patients who are also receiving strong CYP3A4 inhibitors. *Risk D: Consider therapy modification*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ixabepilone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ixabepilone. *Risk D: Consider therapy modification*

Macrolide Antibiotics: May decrease the metabolism of Calcium Channel Blockers. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Magnesium Salts: Calcium Channel Blockers may enhance the adverse/toxic effect of Magnesium Salts. Magnesium Salts may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nafcillin: May increase the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents (Nondepolarizing): Calcium Channel Blockers may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Nilotinib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nisoldipine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nisoldipine. *Risk X: Avoid combination*

Nitroprusside: Calcium Channel Blockers may enhance the hypotensive effect of Nitroprusside. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: Calcium Channel Blockers may decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Strong) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk D: Consider therapy modification*

QuiNIDine: Calcium Channel Blockers (Dihydropyridine) may decrease the serum concentration of QuiNIDine. *Risk C: Monitor therapy*

Quinupristin: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ranolazine. *Risk X: Avoid combination*

Rifamycin Derivatives: May increase the metabolism of Calcium Channel Blockers. This primarily affects oral forms of calcium channel blockers. *Risk D: Consider therapy modification*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Rivaroxaban: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Salmeterol: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Salmeterol. *Risk X: Avoid combination*

Sorafenib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Sorafenib. *Risk C: Monitor therapy*

Tacrolimus: Calcium Channel Blockers (Dihydropyridine) may increase the serum concentration of Tacrolimus. *Risk C: Monitor therapy*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Nicardipine average peak concentrations may be decreased if taken with food. Serum concentrations/toxicity of nicardipine may be increased by grapefruit juice; avoid concurrent use.

Herb/Nutraceutical: St John's wort may decrease levels. Avoid bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (American), kola, licorice (may worsen hypertension). Avoid black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse (may have increased antihypertensive effect).

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents or herbal products patient may be taking (eg, increased risk for toxicity). See Administration for infusion specifics; infusion site must be monitored closely to prevent extravasation; peripheral infusion sites should be changed ever 12 hours. Evaluate therapeutic effectiveness (cardiac status and blood pressure) and adverse reactions (eg, rash, hypotension, bradycardia, confusion, nausea) when starting, adjusting dose, or discontinuing. Teach patient proper use, possible side effects/appropriate interventions (eg, orthostatic precautions), and adverse symptoms to report.

Patient EducationThis medication may be administered by intravenous infusion; report immediately and swelling, redness, burning, or pain at infusion site. **Oral:** Take as directed; do not alter dose or decrease without consulting prescriber. Do not crush or chew sustained release forms; swallow whole. Take with nonfatty food. Avoid caffeine and alcohol. Consult prescriber before increasing exercise routine (decreased angina does not mean it is safe to increase exercise). May cause orthostatic hypotension (change position slowly from sitting or lying to standing, or when climbing stairs); sore mouth (inspect gums for swelling or redness, use soft toothbrush, waxed dental floss, and frequent mouth rinses); dizziness or fatigue (use caution when driving or engaging in tasks that require alertness until response to drug is known); or nausea and dry mouth (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report chest pain, palpitations, rapid heartbeat; swelling of extremities; muscle weakness or pain; respiratory difficulty; or nervousness. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, oral, as hydrochloride: 20 mg, 30 mg

Cardene®: 20 mg, 30 mg

Capsule, sustained release, oral, as hydrochloride:

Cardene® SR: 30 mg, 45 mg, 60 mg

Infusion, premixed in iso-osmotic dextrose, as hydrochloride:

Cardene® IV: 20 mg (200 mL); 40 mg (200 mL)

Infusion, premixed in iso-osmotic sodium chloride, as hydrochloride:

Cardene® IV: 20 mg (200 mL); 40 mg (200 mL)

Injection, solution, as hydrochloride: 2.5 mg/mL (10 mL)

Cardene® IV: 2.5 mg/mL (10 mL)

Generic AvailableYes: Capsule, injection

Pricing: U.S. (www.drugstore.com)

Capsule, 12-hour (Cardene SR)

45 mg (60): $160.99

60 mg (60): $125.99

Capsules (Cardene)

20 mg (90): $69.12

30 mg (90): $99.52

Capsules (NiCARdipine HCl)

20 mg (90): $23.00

30 mg (90): $28.99

Mechanism of ActionInhibits calcium ion from entering the “slow channels” or select voltage-sensitive areas of vascular smooth muscle and myocardium during depolarization, producing a relaxation of coronary vascular smooth muscle and coronary vasodilation; increases myocardial oxygen delivery in patients with vasospastic angina

Pharmacodynamics/Kinetics

Onset of action: Oral: 0.5-2 hours; I.V.: 10 minutes; Hypotension: ~20 minutes

Duration:

I.V.: ≤8 hours

Oral: Immediate release capsules: ≤8 hours; Sustained release capsules: 8-12 hours

Absorption: Oral: ~100%

Protein binding: >95%

Metabolism: Hepatic; CYP3A4 substrate (major); extensive first-pass effect (saturable)

Bioavailability: 35%

Half-life elimination: 2-4 hours

Time to peak, serum: Oral: Immediate release: 30-120 minutes; Sustained release: 60-240 minutes

Excretion: Urine (49% to 60% as metabolites); feces (43% as metabolites)

Related Information

- Calcium Channel Blockers
- Hypertension

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation). Other drugs of this class can cause gingival hyperplasia (ie, nifedipine). The first case of nicardipine-induced gingival hyperplasia has been reported in a child taking 40-50 mg daily for 20 months.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness and dizziness are common; may rarely cause insomnia

Mental Health: Effects on Psychiatric TreatmentConcurrent use with propranolol may increase AV nodal effects

Cardiovascular ConsiderationsNicardipine alone or in combination with other agents is effective in the management of hypertension and angina. Nicardipine should be used with caution in patients with heart failure.

Patients in whom beta-blockade is contraindicated who experience continuing or frequent ischemic pain should be given a nondihydropyridine calcium channel blocker (eg, diltiazem or verapamil) (Class I). Dihydropyridine calcium channel blockers exhibiting a longer duration of action (eg, nicardipine SR or amlodipine) may be considered in addition to adequate beta-blockade or nitrates if patients experience ongoing ischemic chest pain or hypertension. Immediate release dihydropyridine calcium channel blockers should not be administered to patients experiencing continuing or frequent ischemic chest pain in the absence of adequate beta-blockade.

Intravenous nicardipine is an effective agent for the treatment of hypertensive emergencies. In contrast to other shorter-acting agents (eg, nitroprusside), nicardipine exhibits a longer duration of action. Therefore, if hypotension occurs, the duration of hypotension may be prolonged.

Anesthesia and Critical Care Concerns/Other Considerations

Management of Intracerebral Hemorrhage (ICH): Rapid identification of patients experiencing ICH is essential and should be considered a medical emergency due to the progressive deterioration, severe clinical deficits, and high mortality and morbidity. Treatment for ICH has evolved rapidly in recent years. According to the 2007 ACC/AHA Guidelines for the Management of Spontaneous Intracerebral Hemorrhage in Adults, patients with ICH should be treated in a balanced and graded approach with therapies that reduce intracranial pressure (ICP) (eg, mannitol, hypertonic saline solutions, barbiturate coma, head of bed elevation) (Class IIa recommendation). Direct monitoring of ICP and central perfusion pressure (CPP) may be necessary if patient is treated more aggressively. Treatment of ICH with recombinant factor VIIa (rFVIIa) within the first 3-4 hours after onset to slow progression of bleeding has shown promise; however, at this time it cannot be routinely recommended in all patients experiencing ICH (Class IIb recommendation).

Blood pressure (BP) management in patients who are hypertensive is also of paramount importance in treating ICH. The primary rationale for lowering BP is to prevent further progression of the bleed. This can be accomplished using a number of different pharmacologic treatments (eg, nicardipine, labetalol, nitroprusside). Nitroprusside may increase ICP due to the pronounced vasodilatory actions and as a result may be less preferable. Specific BP targets are not supported by available evidence. The 2007 ACC/AHA Guidelines recommend initiating antihypertensive therapy if the SBP >180 mm Hg or if MAP >130 mm Hg.

Index TermsNicardipine Hydrochloride

Medication Safety Issues

Sound-alike/look-alike issues:

NicoDerm® may be confused with Nitroderm

Nicorette® may be confused with Nordette®

Transdermal patch may contain conducting metal (eg, aluminum); remove patch prior to MRI.

Pronunciation(nik oh TEEN)

U.S. Brand NamesCommit® [OTC]; NicoDerm® CQ® [OTC]; Nicorette® [OTC]; Nicotrol® Inhaler; Nicotrol® NS; Thrive™ [OTC]

Canadian Brand NamesHabitrol®; Nicoderm®; Nicorette®; Nicorette® Plus; Nicotrol®

Pharmacologic CategorySmoking Cessation Aid

Use: Labeled IndicationsTreatment to aid smoking cessation for the relief of nicotine withdrawal symptoms (including nicotine craving)

Use: Unlabeled/InvestigationalManagement of ulcerative colitis (transdermal)

Use: DentalTreatment to aid smoking cessation for the relief of nicotine withdrawal symptoms (including nicotine craving)

Dosing: Adults

Tobacco cessation (patients should be advised to completely stop smoking upon initiation of therapy):

Gum: Chew 1 piece of gum when urge to smoke, up to 24 pieces/day. Patients who smoke <25 cigarettes/day should start with 2-mg strength; patients smoking ≥25 cigarettes/day should start with the 4-mg strength. Use according to the following 12-week dosing schedule:

Weeks 1-6: Chew 1 piece of gum every 1-2 hours; to increase chances of quitting, chew at least 9 pieces/day during the first 6 weeks

Weeks 7-9: Chew 1 piece of gum every 2-4 hours

Weeks 10-12: Chew 1 piece of gum every 4-8 hours

Inhaler: Oral: Usually 6-16 cartridges per day; best effect was achieved by frequent continuous puffing (20 minutes); recommended duration of treatment is 3 months, after which patients may be weaned from the inhaler by gradual reduction of the daily dose over 6-12 weeks

Lozenge: Oral: Patients who smoke their first cigarette within 30 minutes of waking should use the 4-mg strength; otherwise the 2-mg strength is recommended. Use according to the following 12-week dosing schedule:

Weeks 1-6: One lozenge every 1-2 hours

Weeks 7-9: One lozenge every 2-4 hours

Weeks 10-12: One lozenge every 4-8 hours

Note: Use at least 9 lozenges/day during first 6 weeks to improve chances of quitting; do not use more than one lozenge at a time (maximum: 5 lozenges every 6 hours, 20 lozenges/day)

Spray: Nasal: 1-2 sprays/hour; do not exceed more than 5 doses (10 sprays) per hour [maximum: 40 doses/day (80 sprays); each dose (2 sprays) contains 1 mg of nicotine]

Transdermal patch: Topical: Apply new patch every 24 hours to nonhairy, clean, dry skin on the upper body or upper outer arm; each patch should be applied to a different site. **Note:** Adjustment may be required during initial treatment (move to higher dose if experiencing withdrawal symptoms; lower dose if side effects are experienced).

NicoDerm CQ®:

Patients smoking ≥10 cigarettes/day: Begin with step 1 (21 mg/day) for 6 weeks, **followed by** step 2 (14 mg/day) for 2 weeks; **finish with** step 3 (7 mg/day) for 2 weeks

Patients smoking <10 cigarettes/day: Begin with step 2 (14 mg/day) for 6 weeks, **followed by** step 3 (7 mg/day) for 2 weeks

Note: Patients who are receiving >600 mg/day of cimetidine: Decrease to the next lower patch size

Benefits of use of nicotine transdermal patches beyond 3 months have not been demonstrated

Ulcerative colitis (unlabeled use): Topical: Transdermal: Titrated to 22-25 mg/day

Dosing: ElderlyRefer to adult dosing.

Administration: Oral

Gum: Should be chewed slowly to avoid jaw ache and to maximize benefit. Chew slowly until it tingles, then park gum between cheek and gum until tingle is gone; repeat process until most of tingle is gone (~30 minutes).

Lozenge: Should not be chewed or swallowed; allow to dissolve slowly (~20-30 minutes)

Administration: TopicalDo not cut patch; causes rapid evaporation, rendering the patch useless. Use of an aerosol corticosteroid may diminish local irritation under patches.

Dietary Considerations

Commit®: Each lozenge contains phenylalanine 3.4 mg and sodium 18 mg.

Nicorette®: Fresh mint and fruit chill flavors: The 2-mg strength contains calcium 94 mg/gum and sodium 11 mg/gum. The 4-mg strength contains calcium 94 mg/gum and sodium 13 mg/gum.

StorageNicotrol®: Store inhaler cartridge at room temperature not to exceed 30°C (86°F). Protect cartridges from light.

ContraindicationsHypersensitivity to nicotine or any component of the formulation; patients who are smoking during the postmyocardial infarction period; patients with life-threatening arrhythmias, or severe or worsening angina pectoris; active temporomandibular joint disease (gum); pregnancy; not for use in nonsmokers

Warnings/Precautions

Disease-related concerns:

- Cardiovascular disease: The risk versus the benefits should be weighed in patients with CAD, serious cardiac arrhythmias, or vasospastic disease; use caution in patients with angina or hypertension.
- Diabetes: Use with caution in patients with insulin-dependent diabetes.
- Gastrointestinal disease: Use with caution in patients with oropharyngeal inflammation, history of esophagitis, or peptic ulcer disease; healing may be delayed.
- Hepatic impairment: Use with caution in patients with severe hepatic impairment; effects on metabolism unknown.
- Hyperthyroidism: Use with caution in patients with hyperthyroidism.
- Pheochromocytoma: Use with caution in patients with pheochromocytoma.
- Renal impairment: Use with caution in patients with severe renal impairment; effects on elimination unknown.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Chewing gum: Dental problems may be worsened by chewing gum.
- Inhaler: Use with caution in patients with bronchospastic disease due to potential airway irritation (other forms of nicotine replacement may be preferred).
- Nasal products: Use of nasal product is not recommended with chronic nasal disorders (eg, allergy, rhinitis, nasal polyps, and sinusitis).
- Topical products: Cautious use of topical nicotine in patients with certain skin diseases. Hypersensitivity to the topical products can occur.
- Transdermal patch: May contain conducting metal (eg, aluminum); remove patch prior to MRI.

Other warnings/precautions:

- Appropriate use: Urge patients to stop smoking completely when initiating therapy.

Geriatric ConsiderationsMust evaluate benefit in the elderly who may have chronic diseases mentioned in Warning and Contraindications. The transdermal systems are as effective in the elderly as they are in younger adults; however, complaints of body aches, dizziness, and asthenia were reported more often in the elderly.

Pregnancy Risk FactorD (nasal)

Pregnancy ConsiderationsNicotine is teratogenic in animal studies. Nicotine exposure via cigarette smoke may cause increased ectopic pregnancy, low birth weight, increased risk of spontaneous abortion, increased perinatal mortality; increased aortic blood flow, increased heart rate, decreased uterine blood flow, and decreased breathing have been reported in the fetus. Smoking during pregnancy is associated with sudden infant death syndrome (SIDS), an increased risk of asthma, infantile colic, and childhood obesity. Women who are pregnant should be encouraged not to smoke. The use of nicotine replacement products to aid in smoking cessation has not been adequately studied in pregnant women (amount of nicotine exposure is varied). Nonpharmacologic treatments are recommended. If the benefits of nicotine replacement therapy outweigh the unknown risks, products with intermittent dosing are suggested to be tried first. If a patch is used, it is suggested to remove it overnight while sleeping to decrease fetal exposure.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsNicotine from cigarette smoke is found in breast milk at 1.5-3 times the maternal plasma concentrations. The amount from nicotine replacement products is not known. Women who are breastfeeding are encouraged not to smoke.

Adverse Reactions

Nasal spray/inhaler:

>10%:

Central nervous system: Headache (18% to 26%)

Gastrointestinal: Inhaler: Mouth/throat irritation (66%), dyspepsia (18%)

Respiratory: Inhaler: Cough (32%), rhinitis (23%)

1% to 10%:

Dermatologic: Acne (3%)

Endocrine & metabolic: Dysmenorrhea (3%)

Gastrointestinal: Flatulence (4%), gum problems (4%), diarrhea, hiccup, nausea, taste disturbance, tooth disorder

Neuromuscular & skeletal: Back pain (6%), arthralgia (5%), jaw/neck pain

Respiratory: Sinusitis

Miscellaneous: Withdrawal symptoms

<1%: Allergy, amnesia, aphasia, bronchitis, bronchospasm, edema, migraine, numbness, pain, purpura, rash, sputum increased, vision abnormalities, xerostomia

Adverse events previously reported in prescription labeling for chewing gum, lozenge and/or transdermal systems. Frequency not defined; may be product or dose specific:

Central nervous system: Concentration impaired, depression, dizziness, headache, insomnia, nervousness, pain

Gastrointestinal: Aphthous stomatitis, constipation, cough, diarrhea, dyspepsia, flatulence, gingival bleeding, glossitis, hiccups, jaw pain, nausea, salivation increased, stomatitis, taste perversion, tooth disorder, ulcerative stomatitis, xerostomia

Dermatologic: Rash

Local: Application site reaction, local edema, local erythema

Neuromuscular & skeletal: Arthralgia, myalgia, paresthesia

Respiratory: Cough, sinusitis

Miscellaneous: Allergic reaction, diaphoresis

Metabolism/Transport Effects**Substrate** (minor) of CYP1A2, 2A6, 2B6, 2C9, 2C19, 2D6, 2E1, 3A4; **Inhibits** CYP2A6 (weak), 2E1 (weak)

Drug Interactions

Adenosine: Nicotine may enhance the AV-blocking effect of Adenosine. Nicotine may enhance the tachycardic effect of Adenosine. *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Nicotine. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Lozenge: Acidic foods/beverages decrease absorption of nicotine.

Monitoring ParametersHeart rate and blood pressure periodically during therapy; discontinue therapy if signs of nicotine toxicity occur (eg, severe headache, dizziness, mental confusion, disturbed hearing and vision, abdominal pain; rapid, weak and irregular pulse; salivation, nausea, vomiting, diarrhea, cold sweat, weakness); therapy should be discontinued if rash develops; discontinuation may be considered if other adverse effects of patch occur such as myalgia, arthralgia, abnormal dreams, insomnia, nervousness, dry mouth, sweating

Nursing: Physical Assessment/MonitoringMonitor cardiac status and vital signs prior to, when beginning, and periodically during therapy. Monitor effectiveness of therapy (according to rationale for therapy), and adverse reactions at beginning and periodically during therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report for prescribed form of drug.

Patient EducationUse exactly as directed; do not use more often than prescribed. Stop smoking completely during therapy. Do not smoke, chew tobacco, use snuff, nicotine gum, or any other form of nicotine. Nicotine overdose could occur.

Gum: Chew slowly for 30 minutes. Discard chewed gum away from access by children.

Lozenge: Allow to dissolve slowly in the mouth. Do not chew or swallow lozenge whole. Avoid food or drink 15 minutes prior to, during, or after lozenge.

Transdermal patch: Follow directions in package for dosing schedule and use. Do not cut patches or wear more than one patch at a time. Remove backing from patch and press immediately on skin. Hold for 10 seconds. Apply to clean, dry skin in different site each day. Do not touch eyes; wash hands after application. You may experience vivid dreams and sleep disturbances, dizziness or lightheadedness (use caution driving or when engaging in tasks requiring alertness until response to drug is known). For nausea, vomiting or GI upset, small frequent meals, chewing gum, and frequent oral care may help. Report persistent vomiting, diarrhea, chills, sweating, chest pain or palpitations, or burning or redness at application site.

Spray: Follow directions in package. Blow nose gently before use. Use 1-2 sprays/hour; do not exceed 5 doses (10 sprays) per hour. Excessive use can result in severe (even life-threatening) reactions. You may experience temporary stinging or burning after spray.

Pregnancy/breast-feeding precautions: Inform prescriber if you are pregnant. Consult prescriber for instruction on appropriate contraceptive measures.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Gum, chewing, as polacrilex: 2 mg (20s, 50s, 110s); 4 mg (20s, 50s, 110s)

- Nicorette®:
    - 2 mg (48s, 50s, 108s, 110s, 168s, 170s, 192s, 200s, 216s) [original and mint flavors]; (48s, 108s, 110s) [orange flavor]; (40s, 100s) [contains calcium 94 mg/gum and sodium 11 mg/gum; fresh mint and fruit chill flavors]
    - 4 mg (48s, 50s, 108s, 110s, 168s, 170s, 192s, 200s, 216s) [original and mint flavors]; (48s, 108s, 110s) [orange flavor]; (40s, 100s) [contains calcium 94 mg/gum and sodium 13 mg/gum; fresh mint and fruit chill flavors]
- Thrive™:
    - 2 mg (40s) [gluten free, sucrose free; mint flavor]
    - 4 mg (40s) [gluten free, sucrose free; mint flavor]

Lozenge, as polacrilex:

- Commit®:
    - 2 mg (48s, 72s, 84s, 168s) [contains phenylalanine 3.4 mg/lozenge, sodium 18 mg/lozenge; mint flavor]; (108s) [contains phenylalanine 3.4 mg/lozenge, sodium 18 mg/lozenge; original flavor]
    - 4 mg (48s, 72s, 84s, 168s, 192s) [contains phenylalanine 3.4 mg/lozenge, sodium 18 mg/lozenge; mint flavor]; (108s) [contains phenylalanine 3.4 mg/lozenge, sodium 18 mg/lozenge; original flavor]

Oral inhalation system:

- Nicotrol® Inhaler: 10 mg cartridge (168s) [cartridge delivers nicotine 4 mg; each unit consists of 5 mouthpieces, 28 storage trays each containing 6 cartridges, and 1 storage case]

Solution, intranasal [spray]:

- Nicotrol® NS: 10 mg/mL (10 mL) [delivers 0.5 mg/spray; 200 sprays]

Transdermal system, topical: 7 mg/24 (30s); 14 mg/24 hours (30s); 21 mg/24 hours (30s)

- NicoDerm® CQ®: 7 mg/24 hours (14s) [step 3; available in tan or clear patch]; 14 mg/24 hours (14s) [step 2; available in tan or clear patch]; 21 mg/24 hours (7s, 14s) [step 1; available in tan or clear patch]

Generic AvailableYes: Transdermal patch and gum

Pricing: U.S. (www.drugstore.com)

Gum (Nicorette Starter Kit)

- 4 mg (110): $52.76

Patch, 24-hour (Nicotine)

- 14 mg/24 hrs (30): $179.98
- 21 mg/24 hrs (30): $168.99

Mechanism of ActionNicotine is one of two naturally-occurring alkaloids which exhibit their primary effects via autonomic ganglia stimulation. The other alkaloid is lobeline which has many actions similar to those of nicotine but is less potent. Nicotine is a potent ganglionic and central nervous system stimulant, the actions of which are mediated via nicotine-specific receptors. Biphasic actions are observed depending upon the dose administered. The main effect of nicotine in small doses is stimulation of all autonomic ganglia; with larger doses, initial stimulation is followed by blockade of transmission. Biphasic effects are also evident in the adrenal medulla; discharge of catecholamines occurs with small doses, whereas prevention of catecholamines release is seen with higher doses as a response to splanchnic nerve stimulation. Stimulation of the central nervous system (CNS) is characterized by tremors and respiratory excitation. However, convulsions may occur with higher doses, along with respiratory failure secondary to both central paralysis and peripheral blockade to respiratory muscles.

Pharmacodynamics/Kinetics

Onset of action: Intranasal: More closely approximate the time course of plasma nicotine levels observed after cigarette smoking than other dosage forms

Duration: Transdermal: 24 hours

Absorption: Transdermal: Slow

Metabolism: Hepatic, primarily to cotinine ($^1/_5$ as active)

Half-life elimination: 4 hours

Time to peak, serum: Transdermal: 8-9 hours

Excretion: Urine

Clearance: Renal: pH dependent

Related Information

Medication Safety Issues

Sound-alike/look-alike issues:

NIFEdipine may be confused with niCARdipine, niMODipine, nisoldipine

Procardia XL® may be confused with Cartia® XT

International issues:

Nipin® [Italy and Singapore] may be confused with Nipent® which is a brand name for pentostatin in the U.S.

Pronunciation(nye FED i peen)

U.S. Brand NamesAdalat® CC; Afeditab™ CR; Nifediac™ CC; Nifedical™ XL; Procardia XL®; Procardia®

Canadian Brand NamesAdalat® XL®; Apo-Nifed PA®; Apo-Nifed®; GEN-Nifedipine XL; Nifedipine PA; Novo-Nifedin; Nu-Nifed; Nu-Nifedipine-PA; PMS-Nifedipine; Procardia®

Pharmacologic CategoryCalcium Channel Blocker

Use: Labeled IndicationsAngina and hypertension (sustained release only), pulmonary hypertension

Dosing: Adults**Hypertension:** Oral: Initial: 10 mg 3 times/day as capsules or 30 mg once daily as sustained release

Usual dose: 10-30 mg 3 times/day as capsules or 30-60 mg once daily as sustained release

Maximum: 120-180 mg/day

Note: Adjustment of sustained release formulations should be made at 7- to 14-day intervals; **Note:** When switching from immediate release to sustained release formulations, total daily dose will start the same.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Hypertrophic cardiomyopathy (unlabeled use): Oral: Children: 0.6-0.9 mg/kg/24 hours in 3-4 divided doses

Hypertension: Oral: Children 1-17 years: Extended release tablet: Initial: 0.25-0.5 mg/kg/day once daily or in 2 divided doses; maximum: 3 mg/kg/day up to 120 mg/day

Dosing: Hepatic ImpairmentReduce oral dose by 50% to 60% in patients with cirrhosis.

Administration: Oral

Immediate release: In general, may be administered with or without food.

Extended release: Tablets should be swallowed whole; do not crush or chew.

Adalat®CC, Afeditab™ CR, Nifediac™ CC: Administer on an empty stomach (per manufacturer). Other extended release products may not have this recommendation; consult product labeling.

Dietary ConsiderationsAvoid grapefruit juice with all products.

Immediate release: Capsule is rapidly absorbed orally if it is administered without food, but may result in vasodilator side effects; if flushing is problematic, administration with low-fat meals may decrease. In general, can take with or without food.

Extended release: Adalat®CC, Afeditab™ CR, Nifediac™ CC: Take on an empty stomach (manufacturer recommendation). Other extended release products may not have this recommendation; consult product labeling.

ContraindicationsHypersensitivity to nifedipine or any component of the formulation; immediate release preparation for treatment of urgent or emergent hypertension; acute MI

Allergy Considerations

- Calcium Channel Blocker, Dihydropyridine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Angina/MI: Increased angina and/or MI has occurred with initiation or dosage titration of calcium channel blockers.
- Hypotension/syncope: Symptomatic hypotension with or without syncope can rarely occur; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. **The use of sublingual short-acting nifedipine in hypertensive emergencies and urgencies is**

neither safe nor effective and SHOULD BE ABANDONED! Serious adverse events (eg, cerebrovascular ischemia, syncope, stroke, acute myocardial infarction, and fetal distress) have been reported in relation to such use.

- Peripheral edema: The most common side effect is peripheral edema; occurs within 2-3 weeks of starting therapy.
- Reflex tachycardia: May occur with use.

Disease-related concerns:

- Aortic stenosis: Use with caution in patients with severe aortic stenosis.
- Heart failure (HF): Use with caution in patients with HF; may cause worsening of symptoms.
- Hepatic impairment: Use with caution in patients with hepatic impairment; may require lower starting dose.
- Idiopathic hypertrophic subaortic stenosis (IHSS): Use with caution in patients with IHSS.

Concurrent drug therapy issues:

- Beta-blockers and fentanyl: Severe hypotension may occur in patients taking immediate release nifedipine concurrently with beta-blockers when undergoing CABG with high dose fentanyl anesthesia. When considering surgery with high dose fentanyl, may consider withdrawing nifedipine (>36 hours) before surgery if possible.

Special populations:

- Elderly: The elderly may be more susceptible to adverse effects.

Dosage form specific issues:

- Extended release formulation: Consists of drug within a nondeformable matrix; following drug release/absorption, the matrix/shell is expelled in the stool. The use of nondeformable products in patients with known stricture/narrowing of the GI tract has been associated with symptoms of obstruction.

Other warnings/precautions:

- Withdrawal: Abrupt withdrawal may cause rebound angina in patients with CAD.

Geriatric ConsiderationsElderly may experience a greater hypotensive response. Theoretically, constipation may be more of a problem in elderly patients. The half-life of nifedipine is extended in elderly patients (6.7 hours) as compared to younger subjects (3.8 hours).

Pregnancy Risk FactorC

Pregnancy ConsiderationsUse in pregnancy only when clearly needed and when the benefits outweigh the potential hazard to the fetus. No data on crossing the placenta. Hypotension, IUGR reported. IUGR probably related to maternal hypertension. May exhibit tocolytic effects. Available evidence suggests safe use during pregnancy.

LactationEnters breast milk/compatible

Breast-Feeding ConsiderationsCrosses into breast milk. Available evidence suggests safe use during breast-feeding. AAP considers **compatible** with breast-feeding.

Adverse Reactions

>10%:

Cardiovascular: Flushing (10% to 25%), peripheral edema (dose related 7% to 10%; up to 50%)

Central nervous system: Dizziness/lightheadedness/giddiness (10% to 27%), headache (10% to 23%)

Gastrointestinal: Nausea/heartburn (10% to 11%)

Neuromuscular & skeletal: Weakness (10% to 12%)

≥1% to 10%:

Cardiovascular: Palpitation (≤2% to 7%), transient hypotension (dose related 5%), CHF (2%)

Central nervous system: Nervousness/mood changes (≤2% to 7%), shakiness (≤2%), jitteriness (≤2%), sleep disturbances (≤2%), difficulties in balance (≤2%), fever (≤2%), chills (≤2%)

Dermatologic: Dermatitis (≤2%), pruritus (≤2%), urticaria (≤2%)

Endocrine & metabolic: Sexual difficulties (≤2%)

Gastrointestinal: Diarrhea (≤2%), constipation (≤2%), cramps (≤2%), flatulence (≤2%), gingival hyperplasia (≤10%)

Neuromuscular & skeletal: Muscle cramps/tremor (≤2% to 8%), inflammation (≤2%), joint stiffness (≤2%)

Ocular: Blurred vision (≤2%)

Respiratory: Cough/wheezing (6%), nasal congestion/sore throat (≤2% to 6%), chest congestion (≤2%), dyspnea (≤2%)

Miscellaneous: Diaphoresis (≤2%)

<1% (Limited to important or life-threatening): Syncope, erythromelalgia, thrombocytopenia, anemia, leukopenia, purpura, allergic hepatitis, angioedema, gingival hyperplasia, depression, paranoid syndrome, transient blindness, tinnitus, nocturia, photosensitivity, polyuria, arthritis with positive ANA, exfoliative dermatitis, gynecomastia, myalgia, memory dysfunction, fever, bezoars (sustained-release preparations), reflux, myoclonus, angina, ischemia, myoclonus

Postmarketing and/or case reports: EPS, aplastic anemia, agranulocytosis, purpura, Stevens-Johnson syndrome, cerebral ischemia, parotitis, dysgeusia, dysosmia, nocturnal enuresis, erythema multiforme

Reported with use of sublingual short-acting nifedipine: Cerebrovascular ischemia, syncope, heart block, stroke, sinus arrest, severe hypotension, acute MI, ECG changes, and fetal distress

Metabolism/Transport Effects **Substrate** of CYP2D6 (minor), 3A4 (major); **Inhibits** CYP1A2 (moderate), 2C9 (weak), 2D6 (weak), 3A4 (weak)

Drug Interactions

Alcohol (Ethyl): May increase the serum concentration of NIFEdipine. *Risk C: Monitor therapy*

Alpha1-Blockers: May enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Calcium Channel Blockers (Dihydropyridine). Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk C: Monitor therapy*

Calcium Salts: May diminish the therapeutic effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Cisapride: May increase the serum concentration of NIFEdipine. Reported with sustained release nifedipine product. *Risk C: Monitor therapy*

Clopidogrel: Calcium Channel Blockers may diminish the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

CycloSPORINE: May decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). Nicardipine may likewise inhibit the metabolism of cyclosporine. Cyclosporine dosage adjustments might be needed. *Risk C: Monitor therapy*

CYP1A2 Substrates: CYP1A2 Inhibitors (Moderate) may decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Calcium Channel Blockers. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Magnesium Salts: Calcium Channel Blockers may enhance the adverse/toxic effect of Magnesium Salts. Magnesium Salts may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nafcillin: May increase the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents (Nondepolarizing): Calcium Channel Blockers may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Nitroprusside: Calcium Channel Blockers may enhance the hypotensive effect of Nitroprusside. *Risk C: Monitor therapy*

Phenytoin: Calcium Channel Blockers may decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk D: Consider therapy modification*

QuiNIDine: Calcium Channel Blockers (Dihydropyridine) may decrease the serum concentration of QuiNIDine. *Risk C: Monitor therapy*

Quinupristin: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Calcium Channel Blockers. This primarily affects oral forms of calcium channel blockers. *Risk D: Consider therapy modification*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Tacrolimus: Calcium Channel Blockers (Dihydropyridine) may increase the serum concentration of Tacrolimus. *Risk C: Monitor therapy*

VinCRIStine: NIFEdipine may decrease the excretion of VinCRIStine. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression and may increase the effects of nifedipine). Monitor.

Food: Nifedipine serum levels may be decreased if taken with food. Food may decrease the rate but not the extent of absorption of Procardia XL®. Increased therapeutic and vasodilator side effects, including severe hypotension and myocardial ischemia, may occur if nifedipine is taken by patients ingesting grapefruit.

Herb/Nutraceutical: St John's wort may decrease nifedipine levels. Avoid dong quai if using for hypertension (has estrogenic activity). Avoid ephedra, yohimbe, ginseng (may worsen hypertension). Avoid garlic (may have increased antihypertensive effect).

Monitoring ParametersHeart rate, blood pressure, signs and symptoms of CHF, peripheral edema

Nursing: Physical Assessment/MonitoringUse caution in severe aortic stenosis or severe hepatic impairment. Assess potential for interactions with other pharmacological agents or herbal products patient is taking that may increase risk of hypotension and toxicity. Assess therapeutic effectiveness (blood pressure and cardiac status) and adverse reactions (eg, hypotension, peripheral edema, gastrointestinal upset, CNS changes) when starting, adjusting dose, or discontinuing. Teach patient proper use, possible side effects/appropriate interventions (eg, orthostatic precautions), and adverse symptoms to report.

Patient EducationDo not take any new medication or over-the-counter medications, or herbal products during therapy unless approved by prescriber (especially anything that may act as a stimulant or depressant). Take exactly as directed; do not alter dose or decrease without consulting prescriber. Do not crush or chew sustained release forms, swallow whole. Avoid grapefruit juice and excess alcohol or caffeine. Consult prescriber before increasing exercise routine (decreased angina does not mean it is safe to increase exercise). May cause orthostatic hypotension (change position slowly from sitting or lying to standing, or when climbing stairs); sore mouth (inspect gums for swelling or redness, use soft toothbrush, waxed dental floss, and frequent mouth rinses); dizziness, difficulties in balance, or fatigue (use caution when driving or engaging in tasks that require alertness until response to drug is known); or nausea or heartburn (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report chest pain, palpitations, rapid heartbeat; swelling of extremities; muscle weakness or pain; respiratory difficulty; nervousness or mood change, rash; or vision changes. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, softgel: 10 mg, 20 mg

Procardia®: 10 mg

Tablet, extended release: 30 mg, 60 mg, 90 mg

Adalat® CC, Procardia XL®: 30 mg, 60 mg, 90 mg

Afeditab™ CR, Nifedical™ XL: 30 mg, 60 mg

Nifediac™ CC: 30 mg, 60 mg, 90 mg [90 mg tablet contains tartrazine]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (NIFEdipine)

10 mg (90): $65.99

20 mg (90): $109.99

Capsules (Procardia)

10 mg (90): $97.35

Tablet, 24-hour (Adalat CC)

30 mg (30): $54.19

90 mg (30): $98.63

Tablet, 24-hour (Afeditab CR)

30 mg (30): $39.99

60 mg (30): $57.92

Tablet, 24-hour (Nifediac CC)

30 mg (100): $108.99

60 mg (30): $49.99

90 mg (30): $60.99

Tablet, 24-hour (Nifedical XL)

30 mg (30): $32.99

60 mg (30): $55.99

Tablet, 24-hour (NIFEdipine CR Osmotic)

30 mg (30): $33.99

60 mg (30): $59.99

90 mg (30): $67.99

Tablet, 24-hour (Procardia XL)

30 mg (30): $68.24

60 mg (30): $110.24

90 mg (30): $121.26

Mechanism of ActionInhibits calcium ion from entering the “slow channels” or select voltage-sensitive areas of vascular smooth muscle and myocardium during depolarization, producing a relaxation of coronary vascular smooth muscle and coronary vasodilation; increases myocardial oxygen delivery in patients with vasospastic angina

Pharmacodynamics/Kinetics

Onset of action: Immediate release: ~20 minutes

Protein binding (concentration dependent): 92% to 98%

Metabolism: Hepatic to inactive metabolites

Bioavailability: Capsule: 40% to 77%; Sustained release: 65% to 89% relative to immediate release capsules

Half-life elimination: Adults: Healthy: 2-5 hours, Cirrhosis: 7 hours; Elderly: 6.7 hours

Excretion: Urine (as metabolites)

Related Information

- Calcium Channel Blockers

Pharmacotherapy PearlsWhen measuring smaller doses from the liquid-filled capsules, consider the following concentrations (for Procardia®) 10 mg capsule = 10 mg/0.34 mL; 20 mg capsule = 20 mg/0.45 mL; may be used preoperative to treat hypertensive urgency.

Considerable attention has been directed to potential increases in mortality and morbidity when short-acting nifedipine is used in treating hypertension. The rapid reduction in blood pressure may precipitate adverse cardiovascular events. At this time, there is no indication for the use of short-acting calcium channel blocker therapy. Nifedipine also has potent negative inotropic effects and can worsen heart failure.

Dental Health: Effects on Dental TreatmentNifedipine has been reported to cause 10% incidence of gingival hyperplasia; effects from 30-100 mg/day have appeared after 1-9 months. Discontinuance results in complete disappearance or marked regression of symptoms; symptoms will reappear upon remedication. Marked regression occurs after 1 week and complete disappearance of symptoms has occurred within 15 days. If a gingivectomy is performed and use of the drug is continued or resumed, hyperplasia usually will recur. The success of the gingivectomy usually requires that the medication be discontinued or that a switch to a noncalcium channel blocker be made. If for some reason nifedipine cannot be discontinued, hyperplasia has not recurred after gingivectomy when extensive plaque control was performed. If nifedipine is changed to another class of cardiovascular agent, the gingival hyperplasia will probably regress and resolve. Switching to another calcium channel blocker may result in continued hyperplasia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common; may cause nervousness, sedation, or mood changes

Mental Health: Effects on Psychiatric TreatmentMay cause leukopenia; use caution with clozapine and carbamazepine; concurrent use with propranolol may increase AV nodal effects; barbiturates may decrease effects of nifedipine

Cardiovascular ConsiderationsConsiderable attention has been directed to potential increases in mortality and morbidity when short-acting nifedipine is used in treating hypertension. The rapid reduction in blood pressure may precipitate adverse cardiovascular events. At this time, there is no indication for the use of short-acting calcium channel blocker therapy for angina and hypertension. Nifedipine also has potent negative inotropic effects and can worsen heart failure.

In the treatment of unstable angina/non-ST-segment elevation MI, a nondihydropyridine calcium antagonist (diltiazem or verapamil) may be considered in patients with continuing or frequently recurring ischemia when beta-blockers are contraindicated (Class I). Oral long-acting calcium antagonists may also be considered in addition to beta-blockers and nitrates (Class IIa).

Anesthesia and Critical Care Concerns/Other ConsiderationsConsiderable attention has been directed to potential increases in mortality and morbidity when short-acting nifedipine is used in treating hypertension. The rapid reduction in blood pressure may precipitate adverse cardiovascular events. At this time, there is no indication for the use of short-acting calcium channel blocker therapy for angina and hypertension. Nifedipine also has potent negative inotropic effects and can worsen heart failure.

Adalat (AR, AT, BE, BF, BG, BJ, BR, CH, CI, CN, CZ, DE, DK, EE, ES, ET, FI, GB, GH, GM, GN, GR, HK, HN, HR, HU, ID, IE, IT, JP, KE, KP, LR, LU, MA, ML, MR, MU, MW, MX, NE, NG, NL, NO, PE, PH, PK, PL, PT, SC, SD, SE, SL, SN, TH, TN, TZ, UG, UY, VE, ZA, ZM, ZW); Adalat 10 (AU); Adalat 20 (AU); Adalat 5 (AU); Adalat CC (PL); Adalat CR (BG, CH, GR, JP, TH); Adalat Crono (IT); Adalat GITS (CL, HK); Adalat GITS 30 (PH); Adalat L (JP); Adalat LA (GB, MY); Adalat LP (FR); Adalat Oros (AU, BB, BM, BR, BS, BZ, CN, CO, CR, DK, DO, EC, EE, ES, FI, GT, GY, ID, JM, KP, NI, NL, NO, PA, PE, PY, SE, SR, SV, TT, TW, UY, VE); Adalat pro Infusione (PL); Adalat Retard (AE, AT, BF, BH, BJ, BR, CI, CN, CY, CZ, DE, EG, ES, ET, GB, GH, GM, GN, GR, HK, ID, IL, IQ, IR, JO, KE, KW, LB, LR, LY, MA, ML, MR, MU, MW, NE, NG, NZ, OM, PE, PH, PY, QA, SA, SC, SD, SL, SN, SY, TH, TN, TZ, UG, YE, ZA, ZM, ZW); Adalat SL (PL); Adalate (FR); Addos XR (AU); Adefin XL (AU); Adipine XL (GB); Alpha-Nifedipine Retard (NZ); Apo-Nifed (PL); Aprical (DE, LU); Atanaal Softcap (TW); Calcheck (PH); Calcibloc (PH); Calcibloc OD (PH); Calcigard (IN, SG, TH); Cardifen (ZA); Cardionorm (PH); Chronadalate LP (FR); Citilat (IT); Coracten (AE, BH, CY, DE, EG, GB, IL, IQ, IR, JO, KW, LB, LY, OM, QA, SA, SY, YE); Coral (IT); Cordafen (PL); Cordaflex (HU); Cordalat (ID); Cordilat (MX); Cordipen (SG); Cordipen Retard (SG); Cordipin (HK, HR, PL); Cordipin Retard (PL); Corinfar (HU, PL); Corinfar Retard (PL); Coronpin (ID); Corotrend (DE); Depin (IN); Depin-E Retard (TH); Dignokonstant (DE); Dipinkor (ID); Duranifin (DE); Ecodipin (CH); Fedcor (PH); Fedipin (ID); Fedipine 24 CR (KP); Fenamon (AE, BF, BH, BJ, CI, CY, EG, ET, GH, GM, GN, IL, IQ, IR, JO, KE, KW, LB, LR, LY, MA, ML, MR, MU, MW, MY, NE, NG, OM, QA, SA, SC, SD, SG, SL, SN, SY, TH, TN, TW, TZ, UG, YE, ZA, ZM, ZW); Fenamon SR (TH); Ficor (ID); Glopir (GR); Hartigard SR (PH); Hexadilat (DK); Huma-Nifedin (HU); Jutadilat (DE); Myogard (AE, BH, CY, EG, IL, IN, IQ, IR, JO, KW, LB, LY, OM, QA, SA, SY, YE); Nedipin (TW); Nelapine (PH); Nicardia CD (TH); Nidipin (HU); Nifadil (HR); Nifangin (FI); Nifar (BF, BJ, CI, ET, GH, GM, GN, KE, LR, MA, ML, MR, MU, MW, NE, NG, SC, SD, SL, SN, TN, TZ, UG, ZA, ZM, ZW); Nifar-GB (MX); Nifdemin (FI); Nifebene (AT); Nifecard (AT, HR, PL); Nifecor (DE); Nifedepat (DE); Nifedicor (IT, PL); Nifedigel (MX); NIfedilat (ZA); Nifedin (IT); Nifedine (IN); Nifedipin (HR); Nifedipin AL (HU); Nifedipin Pharmavit (HU); Nifedipin Stada (LU); Nifedipin-ratiopharm (LU); Nifedipine (PL); Nifegis (PL); Nifehexal (AU, LU, PL); Nifelat (AR, HK, TH); Nifelat-Q (TH); Nifensar (PE); Nifensar Retard (PE); Niferon CR (KP); Nifeslow (LU); Nifestad (PH); Nifezzard (MX); Nificard (AE, BH, CY, EG, IL, IQ, IR, JO, KW, LB, LY, OM, QA, SA, SY, TH, YE); Nifipen (AE, BH, CY, EG, IL, IQ, IR, JO, KW, LB, LY, OM, QA, SA, SY, YE); Niften (IE); Nipin (SG); Normadil (PH); Noviken LP (MX); Nyefax (AU); Nyefax Retard (NZ); Odipin (PH); Orix (GR); Osmo-Adalat (IL); Pidilat (DE); Pressolat (IL); Sepamit (JP); Slow-Nifine (LU); Stada Uno (SG); Unidipin (HU, LU); Vasdalat (ID); Vasdalat Retard (ID); Zenusin (AE, BF, BH, BJ, CI, CY, EG, ET, GH, GM, GN, IL, IQ, IR, JO, KE, KW, LB, LR, LY, MA, ML, MR, MU, MW, NE, NG, OM, PL, QA, SA, SC, SD, SL, SN, SY, TN, TZ, UG, YE, ZA, ZM, ZW)

Nilotinib

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Nilotinib may be confused with nilutamide

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(nye LOE ti nib)

U.S. Brand NamesTasigna®

Canadian Brand NamesTasigna®

Pharmacologic CategoryAntineoplastic Agent, Tyrosine Kinase Inhibitor

Use: Labeled IndicationsTreatment of Philadelphia chromosome-positive chronic myelogenous leukemia (Ph+ CML) in chronic and accelerated phase (refractory or intolerant to prior therapy, including imatinib)

Use: Unlabeled/InvestigationalTreatment of Ph+ acute lymphoblastic leukemia (ALL), systemic mastocytosis (with c-kit activation), hypereosinophilic syndrome

Dosing: Adults**Ph+ CML:** Oral: 400 mg twice daily (continue treatment until disease progression or unacceptable toxicity)

Dosage adjustment for concomitant CYP3A4 inhibitors/inducers:

CYP3A4 inhibitors: The concomitant use of a strong CYP3A4 inhibitor with nilotinib is not recommended. If a strong CYP3A4 inhibitor is required, interruption of nilotinib treatment is recommended; if therapy cannot be interrupted and concurrent use can not be avoided, consider reducing the nilotinib dose by 50%, to 400 mg once daily, with careful monitoring, especially of the QT interval. When a strong CYP3A4 inhibitor is discontinued, allow a washout period prior to adjusting nilotinib dose upward.

CYP3A4 inducers: The concomitant use of a strong CYP3A4 inducer with nilotinib is not recommended. If a strong CYP3A4 inducer is required, the nilotinib dose may need to be increased, with careful monitoring. When the strong CYP3A4 inducer is discontinued, reduce nilotinib to the indicated dose.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNot studied in patients with serum creatinine >1.5 times ULN, however, nilotinib and its metabolites have minimal renal excretion; dosage adjustments for renal dysfunction may not be needed.

Dosing: Hepatic ImpairmentNot studied in patients with hepatic impairment; nilotinib metabolism is primarily hepatic, use caution.

For hepatotoxicity during treatment:

If bilirubin >3 times ULN (≥ grade 3): Withhold treatment, monitor bilirubin, resume treatment at 400 mg once daily when bilirubin returns to ≤1.5 times ULN (≤ grade 1)

If ALT or AST >5 times ULN (≥ grade 3): Withhold treatment, monitor transaminases, resume treatment at 400 mg once daily when ALT or AST returns to ≤2.5 times ULN (≤ grade 1)

Dosing: Adjustment for Toxicity

Dosage adjustment for hematologic toxicity:

ANC <1000/mm^3 and/or platelets <50,000/mm^3: Withhold treatment, monitor blood counts

If ANC >1000/mm^3 and platelets >50,000/mm^3 within 2 weeks: Continue at 400 mg twice daily

If ANC <1000/mm^3 and/or platelets <50,000/mm^3 for >2 weeks: Reduce dose to 400 mg once daily

Dosage adjustment for nonhematologic toxicity:

Amylase or lipase ≥2 times ULN (≥ grade 3): Withhold treatment, monitor serum amylase or lipase, resume treatment at 400 mg once daily when lipase or amylase returns to ≤1.5 times ULN (≤ grade 1)

Clinically-significant moderate or severe nonhematologic toxicity: Withhold treatment, upon resolution of toxicity, resume at 400 mg once daily; may escalate back to 400 mg twice daily if clinically appropriate.

Dosage adjustment for QT prolongation:

QT$_c$ >480 msec: Withhold treatment, monitor and correct potassium and magnesium levels.

If within 2 weeks:

QT_cF returns to <450 msec and to within 20 msec of baseline within 2 weeks: Continue at 400 mg twice daily

QT_cF returns to 450-480 msec: Reduce dose to 400 mg once daily

If QT_cF >480 msec after dosage reduction to 400 mg once daily, discontinue therapy.

Calculations

- ANC: Absolute Neutrophil Count

Administration: OralAdminister twice daily, ~12 hours apart. Swallow capsules whole with water. Administer on an empty stomach, at least 1 hour before or 2 hours after food.

Dietary ConsiderationsThe bioavailability of nilotinib is increased with food. Take on an empty stomach, at least 1 hour before or 2 hours after food. Avoid grapefruit juice.

StorageStore at 15°C to 30°C (59°F to 86°F).

ContraindicationsUse in patients with hypokalemia, hypomagnesemia, or long QT syndrome

Warnings/Precautions

Boxed warnings:

- Administration: See “Other warnings/precautions” below.
- Hepatic impairment: See “Disease-related concerns” below.
- QT prolongation/sudden death: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: Reversible myelosuppression, including grades 3 and 4 thrombocytopenia, neutropenia and anemia may occur; may require dose reductions and/or treatment delay.
- Electrolyte imbalance: Electrolyte abnormalities may occur during treatment, including hypophosphatemia, hyper-/hypokalemia, hypocalcemia and hyponatremia. Correct electrolyte abnormalities prior to treatment initiation.
- Hepatotoxicity: May cause hepatotoxicity, including dose-limiting elevations in bilirubin, transaminases, and alkaline phosphatase; monitor liver function.
- QT prolongation/sudden death: **[U.S. Boxed Warning]: May prolong the QT interval; sudden deaths have been reported.** The sudden deaths reported appear to be related to dose-dependent ventricular repolarization abnormalities. Prolonged QT interval may result in torsade de pointes, which may cause syncope, seizure, and/or death. Use in patients with hypokalemia, hypomagnesemia, or long QT syndrome is contraindicated. Correct electrolyte imbalance prior to initiating therapy; monitor ECG. Avoid the use of QT-prolonging agents and strong CYP3A4 inhibitors. Patients with uncontrolled or significant cardiovascular disease were excluded from studies.

Disease-related concerns:

- Hepatic impairment: **[U.S. Boxed Warning]: Use with caution in patients with hepatic impairment;** nilotinib metabolism is primarily hepatic; carefully monitor for QT prolongation. Nilotinib use in patients with ALT and/or AST >2.5 times ULN (>5 times ULN if disease-related) and/or bilirubin >1.5 times ULN has not been studied.
- Pancreatitis: Use with caution in patients with a history of pancreatitis, may cause dose-limiting elevations of serum lipase and amylase; monitor.

Concurrent drug therapy issues:

- CYP3A4 inhibitors/inducers: Concurrent use with CYP3A4 inhibitors/inducers is not recommended; dosage adjustments are recommended if concurrent use cannot be avoided.
- QT-prolonging agents: Concurrent use with other drugs which may prolong QT interval may increase the risk of potentially-fatal arrhythmias.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Lactose: Capsules contain lactose; do not use with galactose intolerance, severe lactase deficiency, or glucose-galactose malabsorption syndromes.

Other warnings/precautions:

- Administration: **[U.S. Boxed Warning]: Administer on an empty stomach, at least 1 hour before and 2 hours after food.**

Pregnancy Risk FactorD

Pregnancy ConsiderationsAnimal studies have demonstrated embryo-fetal toxicity and maternal toxicity. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should be advised to use effective contraception during treatment.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse effects in the nursing infant, breast-feeding is not recommended.

Adverse ReactionsFrequency not always defined.

10%:

Cardiovascular: Peripheral edema (11%)

Central nervous system: Headache (21% to 31%), fatigue (16% to 28%), fever (14% to 24%)

Dermatologic: Rash (28% to 33%), pruritus (20% to 29%)

Endocrine & metabolic: Hyperglycemia (grades 3/4: 4% to 11%)

Gastrointestinal: Nausea (18% to 31%), diarrhea (19% to 22%), constipation (18% to 21%), vomiting (10% to 21%), lipase increased (grades 3/4: 15% to 17%), abdominal pain (11% to 13%)

Hematologic: Neutropenia (grades 3/4: 28% to 37%; median duration: 15 days), thrombocytopenia (grade 3: 7% to 11%; grade 4: 17% to 30%; median duration: 22 days), anemia (grades 3/4: 8% to 23%)

Neuromuscular & skeletal: Arthralgia (16% to 18%), limb pain (13% to 16%), myalgia (14%), weakness (12% to 14%), muscle spasm (11% to 14%), bone pain (11% to 13%), back pain (10% to 12%)

Respiratory: Cough (13% to 17%), nasopharyngitis (11% to 16%), dyspnea (8% to 11%)

1% to 10%:

Cardiovascular: Flushing, hypertension, palpitation, QT interval prolonged

Central nervous system: Dizziness, dysphonia, insomnia, vertigo

Dermatologic: Alopecia, dry skin, eczema, erythema, hyperhidrosis, urticaria

Endocrine & metabolic: Hypophosphatemia (grades 3/4: 10%), hypokalemia (grades 3/4: 1% to 5%), hyperkalemia (grades 3/4: 3% to 4%), hypocalcemia (grades 3/4: 1% to 4%), hyponatremia (grades 3/4: 3%), albumin decreased (grades 3/4: 1%), hypomagnesemia

Gastrointestinal: Abdominal discomfort, amylase increased, anorexia, dyspepsia, flatulence, pancreatitis (≤1%)

Hematologic: Neutropenic fever, pancytopenia

Hepatic: Hyperbilirubinemia (grades 3/4: 9% to 10%), ALT increased (grades 3/4: 2% to 4%), alkaline phosphatase increased (grades 3/4: 1% to 3%), AST increased (grades 3/4: 1%), GGT increased

Neuromuscular & skeletal: Musculoskeletal pain, paresthesia

Respiratory: Dyspnea (exertional), pleural effusion (≤1%)

Miscellaneous: Night sweats

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Angina, atrial fibrillation, blurred vision, bradycardia, brain edema, bruising, BUN increased, candidiasis, cardiac failure, cardiac flutter, cardiac murmur, cardiomegaly, chest pain, confusion, coronary artery disease, creatinine elevated, depression, diabetes mellitus, diplopia, dysuria, epistaxis, erectile dysfunction, erythema nodosum, exfoliative rash, extrasystoles, eye hemorrhage, facial edema, gastroenteritis, gastrointestinal hemorrhage, gastrointestinal ulcer perforation, gynecomastia, hematemesis, hematoma, hematuria, hemorrhagic shock, hepatitis, hepatomegaly, hepatotoxicity, herpes simplex, hypercalcemia, hyper-/hypothyroidism, hyperphosphatemia, hypertensive crisis, hypoglycemia, hypotension, influenza-like illness, interstitial lung disease, intracranial hemorrhage, jaundice, joint swelling, lactic dehydrogenase increased, leukocytosis, loss of consciousness, melena, MI, migraine, mouth ulceration, optic neuritis, papilledema, pericardial effusion, pericarditis, periorbital edema, peripheral neuropathy, petechiae, pneumonia, pulmonary edema, pulmonary hypertension, renal failure, retroperitoneal hemorrhage, sepsis, stomatitis, subileus, thrombocytosis, thrombosis, thyroiditis, troponin increased, ulcerative esophagitis, urinary tract infection, ventricular dysfunction, visual acuity decreased

Oncology: Emetic PotentialLow (10% to 30%)

Metabolism/Transport Effects**Substrate** of CYP3A4 (major), P-glycoprotein (P-gp, ABCB1); **Inhibits** CYP3A4, 2C8, 2C9, 2D6, UGT1A1, P-glycoprotein (P-gp, ABCB1); **Induces** CYP2B6, 2C8, 2C9

Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Cardiac Glycosides: Antineoplastic Agents may decrease the absorption of Cardiac Glycosides. This may only affect digoxin tablets. **Exceptions:** Digitoxin. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2C8 Substrates (High risk): CYP2C8 Inhibitors (Moderate) may decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Moderate) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May decrease the serum concentration of Nilotinib. *Risk X: Avoid combination*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May increase the serum concentration of Nilotinib. *Risk X: Avoid combination*

Dabigatran Etexilate: P-Glycoprotein Inhibitors may increase the serum concentration of Dabigatran Etexilate. *Risk X: Avoid combination*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Nebivolol: CYP2D6 Inhibitors (Moderate) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

QTc-Prolonging Agents: Nilotinib may enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Silodosin: P-Glycoprotein Inhibitors may increase the serum concentration of Silodosin. *Risk X: Avoid combination*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Antineoplastic Agents may enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid St John's wort (may decrease nilotinib levels).

Monitoring ParametersCBC with differential (every 2 weeks for first 2 months, then monthly); electrolytes (including potassium and magnesium; baseline and periodic); hepatic function (ALT/AST, bilirubin, alkaline phosphatase; baseline and periodic); serum lipase (baseline and periodic); bone marrow assessments; ECG (baseline, 7 days after treatment initiation or dosage adjustments, and periodically thereafter)

Nursing: Physical Assessment/MonitoringUse caution in presence of hepatic or left ventricular dysfunction. Assess all other pharmacological or herbal products patient may be taking for potential adverse interactions (eg, anything that may prolong QT interval or strong CYP3A4 inducers or inhibitors); dose adjustment may be necessary. Evaluate results of laboratory tests at baseline and on a regular basis (eg, CBC, electrolytes, LFTs, serum lipase). Assess therapeutic effectiveness and adverse reactions periodically during therapy (eg, cardiac changes, gastrointestinal disturbance, hyperglycemia, pulmonary status). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential (every 2 weeks for first 2 months, then monthly); electrolytes (including potassium and magnesium; baseline and periodic); hepatic function (ALT/AST, bilirubin, alkaline phosphatase; baseline and periodic); serum lipase (baseline and periodic);

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. Take as directed on an empty stomach, 1 hour before or 2 hours after a meal. Avoid grapefruit or grapefruit juice while taking this medication. Maintain adequate hydration (2-3 L/day unless instructed to restrict fluid intake). You may be required to have regularly scheduled laboratory tests while on this medication. You will be more susceptible to infection (avoid crowds and exposure to infection and do not receive any vaccination unless approved by prescriber). You may experience diarrhea (buttermilk, boiled milk, or yogurt may help); constipation (increased exercise, dietary fluid, or fiber may help); insomnia or fatigue (use caution when driving or engaging in hazardous tasks until response to drug is known); nausea, vomiting, stomach pain, or dyspepsia (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or unusual pain or weakness in joints, muscles, or bone (contact prescriber for appropriate analgesia). Report chest pain, rapid heart beat, or palpitations; swelling or unusual weight gain; unusual cough, respiratory difficulty, or wheezing; easy bruising or unusual bleeding; or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant. Consult prescriber for appropriate contraception while using this medication. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Tasigna®: 200 mg

Generic AvailableNo

Manufacturer

Novartis Pharmaceuticals Corp

Mechanism of ActionSelective tyrosine kinase inhibitor that targets BCR-ABL kinase, c-KIT and platelet derived growth factor receptor (PDGFR); does not have activity against the SRC family. Inhibits BCR-ABL mediated proliferation of leukemic cell lines by binding to the ATP-binding site of BCR-ABL and inhibiting tyrosine kinase activity. Nilotinib has activity in imatinib-resistant BCR-ABL kinase mutations.

Pharmacodynamics/Kinetics

Protein binding: ~98%

Metabolism: Hepatic; oxidation and hydroxylation, via CYP3A4 to primarily inactive metabolites

Bioavailability: Increased 82% when administered 30 minutes after a high-fat meal

Half-life elimination: ~15-17 hours

Time to peak: 3 hours

Excretion: Feces (93%; 69% as parent drug)

Related Information

- Common Toxicity Criteria
- Management of Nausea and Vomiting
- Safe Handling of Hazardous Drugs

Pharmacotherapy PearlsIf clinically indicated, may be administered in combination with hematopoietic growth factors (eg, erythropoietin, filgrastim) and with hydroxyurea or anagrelide.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Mouth ulcerations, stomatitis

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNilotinib is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, mepivacaine and levonordefrin [Carbocaine® 2% with Neo-Cobefrin®]) be used with caution.

Mental Health: Effects on Mental StatusFatigue is common; may cause dizziness and insomnia

Mental Health: Effects on Psychiatric TreatmentNilotinib may decrease the levels/effects of CYP2B6 substrates (eg, bupropion, promethazine, selegiline, and sertraline). Nilotinib may alter (increase or decrease) the levels/effects of CYP2C9 substrates (eg, fluoxetine, phenytoin). May decrease the levels/effects of active metabolites generated by CYP2D6 (eg, codeine and tramadol). May increase the levels/effects of CYP2D6 substrates (eg, amphetamines, select beta-blockers, dextromethorphan, fluoxetine, mirtazapine, nefazodone, paroxetine, risperidone, thioridazine, tricyclic antidepressants, and venlafaxine). Carbamazepine, phenobarbital, and phenytoin may decrease the levels/effects of nilotinib; avoid concurrent use. Avoid concurrent use with nefazodone. Nilotinib may increase the levels/effects of CYP3A4 substrates (eg, benzodiazepines, mirtazapine, nefazodone, and venlafaxine). Avoid concurrent use of nilotinib with other drugs which may prolong QT interval (includes thioridazine and ziprasidone); may increase the risk of potentially-fatal arrhythmias. GI side effects are common; use caution with SSRIs, lithium, and carbamazepine. Hematologic side effects are common; use caution with clozapine, carbamazepine, and valproic acid.

Index TermsAMN107; Nilotinib Hydrochloride Monohydrate

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Nilutamide may be confused with nilotinib

Pronunciation(ni LOO ta mide)

U.S. Brand NamesNilandron®

Canadian Brand NamesAnandron®

Pharmacologic CategoryAntiandrogen; Antineoplastic Agent, Antiandrogen

Use: Labeled IndicationsTreatment of metastatic prostate cancer

Dosing: AdultsRefer to individual protocols. **Prostate cancer:** Oral: 300 mg daily for 30 days starting the same day or day after surgical castration, then 150 mg/day

Dosing: ElderlyRefer to adult dosing.

Dietary ConsiderationsMay be taken without regard to food.

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F). Protect from light.

ContraindicationsHypersensitivity to nilutamide or any component of the formulation; severe hepatic impairment; severe respiratory insufficiency

Allergy Considerations

- Nilutamide Allergy

Warnings/Precautions

Boxed warnings:

- Interstitial pneumonitis: See "Concerns related to adverse effects" below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Hepatic effects: Hepatitis or marked increases in liver enzymes leading to drug discontinuation occurred in 1% of nilutamide patients. Rare cases of elevated hepatic enzymes followed by death have been reported.

- Interstitial pneumonitis: **[U.S. Boxed Warning]: Interstitial pneumonitis has been reported in 2% of patients exposed to nilutamide.** Patients typically experienced progressive exertional dyspnea, and possibly cough, chest pain and fever. X-rays showed interstitial or alveolo-interstitial changes. The suggestive signs of pneumonitis most often occurred within the first 3 months of nilutamide treatment.

- Vision effects: 13% to 57% of patients receiving nilutamide reported a delay in adaptation to the dark, ranging from seconds to a few minutes. This effect sometimes does not abate as drug treatment is continued. Caution patients who experience this effect about driving at night or through tunnels. This effect can be alleviated by wearing tinted glasses.

Geriatric ConsiderationsYour eyes may be slow to adapt to darkness; be careful when driving at night; tinted glasses may help.

Pregnancy Risk FactorC

Pregnancy ConsiderationsNot indicated for use in women

LactationNot indicated for use in women

Adverse Reactions

>10%:

Central nervous system: Headache, insomnia

Endocrine & metabolic: Hot flashes (30% to 67%), gynecomastia (10%)

Gastrointestinal: Nausea (mild - 10% to 32%), abdominal pain (10%), constipation, anorexia

Genitourinary: Testicular atrophy (16%), libido decreased

Hepatic: Transaminases increased (8% to 13%; transient)

Ocular: Impaired dark adaptation (13% to 57%), usually reversible with dose reduction, may require discontinuation of the drug in 1% to 2% of patients

Respiratory: Dyspnea (11%)

1% to 10%:

Cardiovascular: Chest pain, edema, heart failure, hypertension, syncope

Central nervous system: Dizziness, drowsiness, malaise, hypoesthesia, depression

Dermatologic: Pruritus, alopecia, dry skin, rash

Endocrine & metabolic: Disulfiram-like reaction (hot flashes, rash) (5%); Flu-like syndrome, fever

Gastrointestinal: Vomiting, diarrhea, dyspepsia, GI hemorrhage, melena, weight loss, xerostomia

Genitourinary: Hematuria, nocturia

Hematologic: Anemia

Hepatic: Hepatitis (1%)

Neuromuscular & skeletal: Arthritis, paresthesia

Ocular: Chromatopsia (9%), abnormal vision (6% to 7%), cataracts, photophobia

Respiratory: Interstitial pneumonitis (2% - typically exertional dyspnea, cough, chest pain, and fever; most often occurring within the first 3 months of treatment); rhinitis

Miscellaneous: Diaphoresis

<1%, postmarketing, and/or case reports: Aplastic anemia

Oncology: Emetic PotentialLow (10% to 30)

Metabolism/Transport Effects**Substrate** of CYP2C19 (major); **Inhibits** CYP2C19 (weak)

Drug Interactions

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Moderate): May decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Strong): May decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol. Up to 5% of patients may experience a systemic reaction (flushing, hypotension, malaise) when combined with nilutamide.

Herb/Nutraceutical: St John's wort may decrease nilutamide levels.

Monitoring ParametersObtain a chest x-ray if a patient reports dyspnea; if there are findings suggestive of interstitial pneumonitis, discontinue treatment with nilutamide. Measure serum hepatic enzyme levels at baseline and at regular intervals (3 months); if transaminases increase over 2-3 times the upper limit of normal, discontinue treatment. Perform appropriate laboratory testing at the first symptom/sign of liver injury (eg, jaundice, dark urine, fatigue, abdominal pain or unexplained GI symptoms).

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents and herbal products patient may be taking (eg, agents that may increase or decrease levels/effects of nilutamide). Evaluate results of chest x-rays and laboratory tests at baseline and at regular 3-month intervals. Assess effectiveness and adverse response (eg, signs of interstitial pneumonitis [dyspnea, chest pain, cough, fever], hepatitis, visual changes [impaired dark adaptation]). Teach patient proper use, possible side effects/appropriate interventions (eg, orthostatic precautions), and adverse symptoms to report.

Monitoring: Lab TestsChest x-rays prior to and regularly during treatment. Measure serum hepatic enzyme levels at baseline and at regular intervals (3 months). If transaminases increase over 2-3 times the upper limit of normal, discontinue treatment. Perform appropriate laboratory testing at the first symptom/sign of liver injury (eg, jaundice, dark urine, fatigue, abdominal pain, or unexplained GI symptoms).

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as prescribed; do not change dosing schedule or stop taking without consulting prescriber. Avoid alcohol while taking this medication; may cause severe adverse reaction. Periodic laboratory tests are necessary while taking this medication. May cause loss of light accommodation (avoid night driving and use caution in poorly lighted or changing light situations such as tunnels); dizziness, confusion, or blurred vision (avoid driving or engaging in tasks that are potentially hazardous until response to drug is known); nausea or anorexia (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or hot flashes, gynecomastia, decreased libido, impotence or sexual dysfunction (consult prescriber). Report any decreased respiratory function (eg, dyspnea, increased cough); unexplained fever; difficulty or painful voiding or blood in urine; or other persistent adverse effects.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 150 mg

Generic AvailableNo

ManufacturerAventis Pharmaceuticals, Inc

Pricing: U.S. (www.drugstore.com)

Tablets (Nilandron)

150 mg (30): $402.53

Mechanism of ActionNonsteroidal antiandrogen that inhibits androgen uptake or inhibits binding of androgen in target tissues. It specifically blocks the action of androgens by interacting with cytosolic androgen receptor F sites in target tissue

Pharmacodynamics/Kinetics

Absorption: Rapid and complete

Protein binding: 72% to 85%

Metabolism: Hepatic, forms active metabolites

Half-life elimination: Terminal: 23-87 hours; Metabolites: 35-137 hours

Excretion: Urine (up to 78% at 120 hours; <1% as unchanged drug); feces (1% to 7%)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusInsomnia is common; may cause dizziness or depression

Mental Health: Effects on Psychiatric TreatmentNone reported

NiMODipine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

NiMODipine may be confused with niCARdipine, NIFEdipine, nisoldipine

Administration issues: **For oral administration only.** For patients unable to swallow a capsule, the drug should be dispensed in an oral syringe labeled **"for oral use only."** Nimodipine has inadvertently been administered I.V. when withdrawn from capsules into a syringe for subsequent nasogastric administration. Severe cardiovascular adverse events, including fatalities, have resulted. Employ precautions against such an event.

Pronunciation(nye MOE di peen)

U.S. Brand NamesNimotop® [DSC]

Canadian Brand NamesNimotop®

Pharmacologic CategoryCalcium Channel Blocker

Use: Labeled IndicationsSpasm following subarachnoid hemorrhage from ruptured intracranial aneurysms regardless of the patients neurological condition postictus (Hunt and Hess grades I-V)

Dosing: Adults**Note:** Capsules and contents are for oral administration **ONLY.**

Subarachnoid hemorrhage: Oral: 60 mg every 4 hours for 21 days, start therapy within 96 hours after subarachnoid hemorrhage.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNot removed by hemo- or peritoneal dialysis; supplemental dose is not necessary.

Dosing: Hepatic ImpairmentReduce dosage to 30 mg every 4 hours in patients with liver failure.

Administration: OralFor oral administration **ONLY.** If the capsules cannot be swallowed, the liquid may be removed by making a hole in each end of the capsule with an 18-gauge needle and extracting the contents into a syringe. If given via NG tube, follow with a flush of 30 mL NS.

ContraindicationsHypersensitivity to nimodipine or any component of the formulation

Allergy Considerations

- Calcium Channel Blocker, Dihydropyridine Allergy

Warnings/Precautions

Boxed warnings:

- Inadvertent I.V. administration: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Angina/MI: Increased angina and/or MI has occurred with initiation or dosage titration of calcium channel blockers.
- Hypotension/syncope: Symptomatic hypotension with or without syncope can rarely occur; blood pressure must be lowered at a rate appropriate for the patient's clinical condition.
- Ileus/ pseudo-obstruction: Intestinal pseudo-obstruction and ileus have been reported during therapy; use caution in patients with decreased GI motility of a history of bowel obstruction.
- Peripheral edema: The most common side effect is peripheral edema; occurs within 2-3 weeks of starting therapy.
- Reflex tachycardia: May occur with use.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; may require lower starting dose.
- Idiopathic hypertrophic subaortic stenosis (IHSS): Use with caution in patients with IHSS.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Inadvertent I.V. administration: **[U.S. Boxed Warning]: Nimodipine has inadvertently been administered I.V. when withdrawn from capsules into a**

syringe for subsequent nasogastric administration. Severe cardiovascular adverse events, including fatalities, have resulted; precautions should be employed against such an event.

Geriatric ConsiderationsElderly may experience a greater hypotensive response. Constipation may be more of a problem in the elderly. Studies in the treatment of Alzheimer's disease have not demonstrated clear clinical effect.

Pregnancy Risk FactorC

Pregnancy ConsiderationsUse in pregnancy only when clearly needed and when the benefits outweigh the potential hazard to the fetus. Teratogenic and embryotoxic effects have been demonstrated in small animals. No well-controlled studies have been conducted in pregnant women.

LactationEnters breast milk/not recommended

Adverse Reactions

1% to 10%:

Cardiovascular: Reductions in systemic blood pressure (1% to 8%)

Central nervous system: Headache (1% to 4%)

Dermatologic: Rash (1% to 2%)

Gastrointestinal: Diarrhea (2% to 4%), abdominal discomfort (2%)

<1% (Limited to important or life-threatening): Edema (≤1%), ECG abnormalities (≤1%), tachycardia (0% to 1%), bradycardia (≤1%), depression (≤1%), acne (≤1%), nausea (≤1%), hemorrhage, hepatitis, muscle cramps/pain (≤1%), dyspnea (≤1%). itching, GI hemorrhage, thrombocytopenia, anemia, palpitation, vomiting, flushing, diaphoresis, wheezing, lightheadedness, dizziness, rebound vasospasm, jaundice, hypertension, hematoma, neurological deterioration, CHF, hyponatremia, disseminated intravascular coagulation, deep vein thrombosis

Case report: Disseminated intravascular coagulation (DIC)

Metabolism/Transport Effects**Substrate** of CYP3A4 (major)

Drug Interactions

Alpha1-Blockers: May enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Calcium Channel Blockers (Dihydropyridine). Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk C: Monitor therapy*

Calcium Salts: May diminish the therapeutic effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Clopidogrel: Calcium Channel Blockers may diminish the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

CycloSPORINE: May decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). Nicardipine may likewise inhibit the metabolism of cyclosporine. Cyclosporine dosage adjustments might be needed. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Calcium Channel Blockers. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Magnesium Salts: Calcium Channel Blockers may enhance the adverse/toxic effect of Magnesium Salts. Magnesium Salts may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nafcillin: May increase the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents (Nondepolarizing): Calcium Channel Blockers may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Nitroprusside: Calcium Channel Blockers may enhance the hypotensive effect of Nitroprusside. *Risk C: Monitor therapy*

Phenytoin: Calcium Channel Blockers may decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk D: Consider therapy modification*

QuiNIDine: Calcium Channel Blockers (Dihydropyridine) may decrease the serum concentration of QuiNIDine. *Risk C: Monitor therapy*

Quinupristin: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Calcium Channel Blockers. This primarily affects oral forms of calcium channel blockers. *Risk D: Consider therapy modification*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Tacrolimus: Calcium Channel Blockers (Dihydropyridine) may increase the serum concentration of Tacrolimus. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Nimodipine has shown a 1.5-fold increase in bioavailability when taken with grapefruit juice; avoid concurrent use.

Herb/Nutraceutical: St John's wort may decrease levels. Avoid dong quai if using for hypertension (has estrogenic activity). Avoid ephedra, yohimbe, ginseng (may worsen hypertension). Avoid garlic (may have increased antihypertensive effect).

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents and herbal products patient may be taking (eg, increased risk of hypotension with other antihypertensives). Assess therapeutic effectiveness (blood pressure and cardiac status) and adverse response (eg, rash, hypotension, diarrhea, confusion) when starting or adjusting dose and periodically during long-term therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed; do not alter dose or decrease without consulting prescriber. Avoid grapefruit juice while taking this medication. May cause orthostatic hypotension (change position slowly from sitting or lying to standing, or when climbing stairs); headache (consult prescriber for approved analgesic); or diarrhea (buttermilk, boiled milk, or yogurt may help). Report chest pain, palpitations, slow heartbeat, respiratory difficulty, or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule, liquid filled: 30 mg

Nimotop®: 30 mg [DSC]

Generic AvailableYes

ManufacturerBayer Corp (Biological and Pharmaceutical Division)

Pricing: U.S. (www.drugstore.com)

Capsules (Nimodipine)

30 mg (100): $599.99

Mechanism of ActionNimodipine shares the pharmacology of other calcium channel blockers; animal studies indicate that nimodipine has a greater effect on cerebral arterials than other arterials; this increased specificity may be due to the drug's increased lipophilicity and cerebral distribution as compared to nifedipine; inhibits calcium ion from entering the “slow channels” or select voltage sensitive areas of vascular smooth muscle and myocardium during depolarization

Pharmacodynamics/Kinetics

Protein binding: >95%

Metabolism: Extensively hepatic

Bioavailability: 13%

Half-life elimination: 1-2 hours; prolonged with renal impairment

Time to peak, serum: ~1 hour

Excretion: Urine (50%) and feces (32%) within 4 days

Related Information

- Calcium Channel Blockers

Dental Health: Effects on Dental TreatmentOther drugs of this class can cause gingival hyperplasia (ie, nifedipine) but there have been no reports for nimodipine.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness; may rarely cause depression

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsNimodipine is primarily used in the treatment of subarachnoid hemorrhage and is not used in the management of essential hypertension or angina.

Anesthesia and Critical Care Concerns/Other ConsiderationsAnimal studies suggest nimodipine may have a greater effect on cerebral arterioles, possibly due to its lipophilicity which increases cerebral distribution.

Special Alerts

Nisoldipine (Sular®): New Formulation and Dosing - May 2008

Sular® (nisoldipine) has been reformulated (March 2008). Sular® is now available in 8.5 mg, 17 mg, 25.5 mg, and 34 mg extended release tablets.

Sular® Dosing Changes

Old Dose	New Dose
10 mg	8.5 mg
20 mg	17 mg
30 mg	25.5 mg
40 mg	34 mg

Medication Safety Issues

Sound-alike/look-alike issues:

Nisoldipine may be confused with NIFEdipine, niMODipine

Pronunciation(nye SOL di peen)
U.S. Brand NamesSular®
Pharmacologic CategoryCalcium Channel Blocker
Use: Labeled IndicationsManagement of hypertension, alone or in combination with other antihypertensive agents
Dosing: Adults

Hypertension: Oral: Initial: 17 mg once daily, then increase by 8.5 mg/week (or longer intervals) to attain adequate control of blood pressure

Usual dose range:

17-34 mg once daily; doses >34 mg once daily are not recommended.

Dosing: ElderlyInitial dose: 8.5 mg/day, increase by 8.5 mg/week (or longer intervals) to attain adequate blood pressure control.
Dosing: Hepatic ImpairmentA starting dose not exceeding 8.5 mg/day is recommended for patients with hepatic impairment.
Administration: OralAdminister at the same time each day to ensure minimal fluctuation of serum levels. Avoid high-fat diet. Administer on an empty stomach (1 hour before or 2 hours after a meal). Swallow whole; do not crush, break, split, or chew.
Dietary ConsiderationsTake on an empty stomach (1 hour before or 2 hours after a meal).
StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F). Protect from light; protect from moisture.
ContraindicationsHypersensitivity to nisoldipine, any component of the formulation, or other dihydropyridine calcium channel blockers
Allergy Considerations

- Calcium Channel Blocker, Dihydropyridine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Angina/MI: With initiation or dosage titration of dihydropyridine calcium channel blockers, reflex tachycardia may occur resulting in angina and/or MI in patients with obstructive coronary disease especially in the absence of concurrent beta-blockade.
- Hypotension/syncope: Symptomatic hypotension with or without syncope can rarely occur; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. Monitor closely during initial dosing and with dosage adjustment.
- Peripheral edema: The most common side effect is peripheral edema; occurs within 2-3 weeks of starting therapy.

Disease-related concerns:

- Aortic stenosis: Use with caution in patients with severe aortic stenosis.

- Heart failure (HF): Use with caution in patients with HF; safety and efficacy has not been established.

- Hepatic impairment: Use with caution in patients with severe hepatic impairment; lower starting dose required.

- Hypertrophic cardiomyopathy (HCM) with outflow tract obstruction: Use with caution in patients with HCM and outflow tract obstruction since reduction in afterload may worsen symptoms associated with this condition.

Dosage form specific issues:

- Tartrazine: Contains tartrazine, which may cause allergic reactions in certain individuals (eg, aspirin hypersensitivity).

Special populations:

- Elderly: Use with caution in patients >65 years of age; lower starting dose recommended.

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsElderly have been found to have two- to threefold greater serum concentrations than younger adults. Therefore, begin therapy at lowest recommended doses. Elderly may experience a greater hypotensive response. Constipation may be more of a problem in the elderly. Calcium channel blockers are no more effective in the elderly than other therapies; however, they do not cause significant CNS effects which is an advantage over some antihypertensive agents.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies have demonstrated fetotoxic but not teratogenic effects. There are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if potential benefit to the mother outweighs potential risk to the fetus.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%:

Cardiovascular: Peripheral edema (dose related; 7% to 27%)

Central nervous system: Headache (22%)

1% to 10%:

Cardiovascular: Vasodilation (4%), palpitation (3%), angina exacerbation (2%), chest pain (2%)

Central nervous system: Dizziness (3% to 7%)

Dermatologic: Rash (2%)

Gastrointestinal: Nausea (2%)

Respiratory: Pharyngitis (5%), sinusitis (3%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Alopecia, amblyopia, amnesia, anemia, angina, anxiety, arthralgia, arthritis, asthma, ataxia, atrial fibrillation, blepharitis, BUN increased, bruising, cellulitis, cerebral ischemia, chills, colitis, confusion, conjunctivitis, cough, creatinine increased, creatine kinase increased, CVA, depression, diabetes mellitus, diaphoresis, diarrhea, dyspepsia, dysphagia, dyspnea, dysuria, end inspiratory wheeze, epistaxis, exfoliative dermatitis, facial edema, fever, first-degree AV block, flu-like syndrome, fungal dermatitis, gastritis, gastrointestinal hemorrhage, gingival hyperplasia, glaucoma, glossitis, gout, gynecomastia, heart failure, hematuria, hepatomegaly, herpes simplex, herpes zoster; hypersensitivity reaction (eg, angioedema, shortness of breath, tachycardia, chest tightness, hypotension, and rash); hyper-/hypotension, hypertonia, hypoesthesia, hypokalemia, jugular venous distention, keratoconjunctivitis, laryngitis, leg cramps, leukopenia, libido decreased, liver function tests abnormal, maculopapular rash, malaise, melena, migraine, mouth ulceration, myalgia, myasthenia, MI, myositis, nervousness, nocturia, nonprotein nitrogen increased, otitis media, paresthesia, petechiae, photosensitivity, pleural effusion, postural hypotension, pruritus, pustular rash, rales, retinal detachment, skin discoloration, skin ulcer, somnolence, supraventricular tachycardia, syncope, systolic ejection murmur, temporary unilateral loss of vision, tenosynovitis, thyroiditis, tinnitus, tremor; T-wave abnormalities on ECG (flattening, inversion, nonspecific changes); urinary frequency, urticaria, vaginal hemorrhage, vaginitis, venous insufficiency, ventricular extrasystoles, vertigo, vision abnormal, vitreous floater, weight gain/loss, xerostomia

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP1A2 (weak), 3A4 (weak)

Drug Interactions

Alpha1-Blockers: May enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Tacrolimus: Calcium Channel Blockers (Dihydropyridine) may increase the serum concentration of Tacrolimus. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Nisoldipine bioavailability may be increased if taken with high-lipid foods or with grapefruit juice. Avoid grapefruit products before and after dosing.

Herb/Nutraceutical: Avoid St John's wort (may decrease nisoldipine levels). Avoid bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (American), kola, licorice (may worsen hypertension). Avoid black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse (may have increased antihypertensive effect).

Monitoring ParametersBlood pressure, heart rate

Nursing: Physical Assessment/MonitoringUse caution in presence of severe aortic stenosis, HF, hypertrophic cardiomyopathy with outflow tract obstruction or hepatic impairment. Assess potential for interactions with other pharmacological agents and herbal products patient may be taking (eg, increased potential for hypotension with other antihypertensives). Assess therapeutic effectiveness (cardiac status and blood pressure) and adverse response (eg, chest pain, dyspnea, cough, edema, rash, nausea, confusion) when starting or adjusting dose and periodically during long-term therapy. When discontinuing, taper dose gradually (over 2 weeks). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new prescription or over-the-counter medications, or herbal products during therapy without consulting prescriber. Take exactly as directed; do not alter dose or decrease without consulting prescriber. Do not crush or chew tablets; swallow whole. Take on an empty stomach (1 hour before or 2 hours after a meal). This drug does not replace diet and other exercise recommendations of prescriber. May cause orthostatic hypotension (change position slowly when rising from sitting or lying, or when climbing stairs); headache (consult prescriber for approved analgesic); dizziness (use caution when driving or engaging in tasks that require alertness until response to drug is known); or nausea (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report weight gain or swelling of extremities; chest pain, palpitations, irregular heartbeat; persistent dizziness; respiratory difficulty; unusual cough; rash; vision changes; anxiety, confusion, depression, or other CNS changes; or other persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, extended release [original formulation]: 20 mg, 30 mg, 40 mg

Sular®: 10 mg, 20 mg, 30 mg 40 mg [DSC]

Tablet, extended release [Geomatrix® delivery system]:

Sular®: 8.5 mg; 17 mg [contains tartrazine]; 25.5 mg, 34 mg

Generic AvailableYes: Extended release tablet

ManufacturerSciele Pharma, Inc

Pricing: U.S. (www.drugstore.com)

Tablet, 24-hour (Sular)

8.5 mg (100): $228.10

10 mg (30): $65.99

17 mg (100): $280.58

25.5 mg (100): $307.93

30 mg (30): $86.99

34 mg (100): $307.93

40 mg (30): $85.99

Mechanism of ActionAs a dihydropyridine calcium channel blocker, structurally similar to nifedipine, nisoldipine impedes the movement of calcium ions into vascular smooth muscle and cardiac muscle. Dihydropyridines are potent vasodilators and are not as likely to suppress cardiac contractility and slow cardiac conduction as other calcium antagonists such as verapamil and diltiazem; nisoldipine is 5-10 times as potent a vasodilator as nifedipine.

Pharmacodynamics/Kinetics

Duration: >24 hours

Absorption: Well absorbed

Protein binding: >99%

Metabolism: Extensively hepatic; 1 active metabolite (10% of parent); first-pass effect

Bioavailability: ~5%

Half-life elimination: 9-18 hours

Time to peak: 4-14 hours

Excretion: Urine (as metabolites)

Related Information

- Calcium Channel Blockers

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Unlike other calcium channel blockers, information is sparse as to whether nisoldipine causes gingival hyperplasia. Consultation with physician is suggested if hyperplasia is observed in patients taking nisoldipine.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsNisoldipine alone or in combination with other agents is effective in the management of hypertension and angina. Nisoldipine should be avoided in patients with left ventricular systolic dysfunction because of negative inotropic effects.

In the treatment of unstable angina/non-ST-segment elevation MI, a nondihydropyridine calcium antagonist (diltiazem or verapamil) may be considered in patients with continuing or frequently recurring ischemia when beta-blockers are contraindicated (Class I). Oral long-acting calcium antagonists may also be considered in addition to beta-blockers and nitrates (Class IIa).

Nitazoxanide

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(nye ta ZOX a nide)
U.S. Brand NamesAlinia®
Pharmacologic CategoryAntiprotozoal
Use: Labeled IndicationsTreatment of diarrhea caused by *Cryptosporidium parvum* or *Giardia lamblia*
Dosing: Adults**Diarrhea caused by *Cryptosporidium parvum* or *Giardia lamblia*:** Oral: 500 mg every 12 hours for 3 days
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Diarrhea caused by *Cryptosporidium parvum* or *Giardia lamblia*:** Oral:
Children 1-3 years: 100 mg every 12 hours for 3 days

Children 4-11 years: 200 mg every 12 hours for 3 days

Children ≥12 years: Refer to adult dosing.

Dosing: Renal ImpairmentSpecific recommendations are not available; use with caution.
Dosing: Hepatic ImpairmentSpecific recommendations are not available; use with caution.
Administration: OralAdminister with food. Shake suspension well prior to administration.
Dietary ConsiderationsShould be taken with food. Suspension contains sucrose 1.48 g/5 mL.
Storage

Suspension: Prior to and following reconstitution, store at room temperature of 15°C to 30°C (59°F to 86°F). Following reconstitution, discard unused portion of suspension after 7 days.

Tablet: Store at room temperature.

ReconstitutionFor preparation at time of dispensing, add 48 mL incrementally to 60 mL bottle; shake vigorously. Resulting suspension is 20 mg/mL (100 mg per 5 mL).
ContraindicationsHypersensitivity to nitazoxanide or any component of the formulation
Warnings/Precautions

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.
- HIV: Safety and efficacy have not been established in patients with HIV infection.
- Renal impairment: Use with caution in patients with renal impairment.

Special populations:

- Immunocompromised patients: Safety and efficacy have not been established in patients with immunodeficiency.
- Pediatrics:

  Oral suspension: Safety and efficacy have not been established in children <1 year of age.

  Tablet: Safety and efficacy have not been established in children <12 years of age.

Pregnancy Risk FactorB
Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsRates of adverse effects were similar to those reported with placebo.

1% to 10%:

Central nervous system: Headache (1% to 3%)

Gastrointestinal: Abdominal pain (7% to 8%), diarrhea (2% to 4%), nausea (3%), vomiting (1%)

<1% (Limited to important or life-threatening): Allergic reaction, ALT increased, anemia, anorexia, appetite increased, creatinine increased, diaphoresis, dizziness, eye discoloration (pale yellow), fever, flatulence, hypertension, infection, malaise, nausea, pruritus, rhinitis, salivary glands enlarged, tachycardia, urine discoloration

Drug InteractionsThere are no known significant interactions.
Ethanol/Nutrition/Herb InteractionsFood: Food increases AUC.
Patient EducationAdminister exactly as directed. Do not alter dose; administer with food. Shake suspension well before using. Store at

room temperature and discard any unused portion of suspension after 7 days. May cause headache, abdominal pain, diarrhea, or vomiting. If severe or persistent, contact prescriber. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Powder for suspension, oral: 100 mg/5 mL (60 mL) [contains sucrose 1.48 g/5 mL, sodium benzoate; strawberry flavor]

Tablet: 500 mg

Alinia® 3-Day Therapy Packs™ [unit-dose pack]: 500 mg (6s)

Generic AvailableNo
ManufacturerRomark Laboratories
Pricing: U.S. (www.drugstore.com)

Tablets (Alinia)

500 mg (60): $1233.31

Mechanism of ActionNitazoxanide is rapidly metabolized to the active metabolite tizoxanide *in vivo*. Activity may be due to interference with the pyruvate:ferredoxin oxidoreductase (PFOR) enzyme-dependent electron transfer reaction which is essential to anaerobic metabolism. *In vitro*, nitazoxanide and tizoxanide inhibit the growth of sporozoites and oocysts of *Cryptosporidium parvum* and trophozoites of *Giardia lamblia*.

Pharmacodynamics/Kinetics

Protein binding: Tizoxanide: >99%

Bioavailability: Relative bioavailability of suspension compared to tablet: 70%

Metabolism: Hepatic, to an active metabolite, tizoxanide. Tizoxanide undergoes conjugation to form tizoxanide glucuronide. Nitazoxanide is not detectable in the serum following oral administration.

Time to peak, plasma: Tizoxanide and tizoxanide glucuronide: 1-4 hours

Excretion: Tizoxanide: Urine, bile, and feces; Tizoxanide glucuronide: Urine and bile

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay rarely cause dizziness
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsNTZ

English

Jump To Field (Select Field Name)

Pronunciation(ni TIS i known)

U.S. Brand NamesOrfadin®

Pharmacologic Category4-Hydroxyphenylpyruvate Dioxygenase Inhibitor

Use: Labeled IndicationsTreatment of hereditary tyrosinemia type 1 (HT-1); to be used with dietary restriction of tyrosine and phenylalanine

Dosing: Adults**Note:** Must be used in conjunction with a low protein diet restricted in tyrosine and phenylalanine.

HT-1: Oral: Initial: 1 mg/kg/day in divided doses, given in the morning and evening, 1 hour before meals; doses do not need to be divided evenly

Dose adjustment: If biochemical parameters (see Monitoring Laboratory Tests) are not normalized within in 1-month period, dose may be increased to 1.5 mg/kg/day (maximum dose: 2 mg/kg/day).

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Must be used in conjunction with a low protein diet restricted in tyrosine and phenylalanine.

HT-1: Oral: Infants and Children: Refer to adult dosing. Infants may require maximal dose once liver function has improved.

Administration: OralAdminister 1 hour prior to a meal. Capsules may be opened and contents suspended in a small quantity of water, formula, or apple sauce; use immediately.

Dietary ConsiderationsBecause the effect of food is unknown, nitisinone should be taken 1 hour prior to a meal. Dietary restriction of tyrosine and phenylalanine is required.

StorageStore under refrigeration at 2°C to 8°C (36°F to 46°F).

RestrictionsDistributed by Rare Disease Therapeutics, Inc (contact 615-399-0700)

ContraindicationsThere are no contraindications listed within the manufacturer's labeling.

Warnings/Precautions

Concerns related to adverse effects:

- Hematologic effects: Transient leukopenia and/or thrombocytopenia may occur.

Other warnings/precautions:

- Dietary restrictions: Must be used with dietary restriction of tyrosine and phenylalanine; inadequate restriction can result in toxic effects to the eyes, skin, and nervous system (nutritional consultation required).

- Experienced physician: For use by physicians experienced in treating HT-1.

- Eye examination: Patients should have slit-lamp examination of the eyes prior to beginning treatment.

- Monitoring: Careful monitoring of liver, platelet and white blood cell counts, plasma tyrosine levels and other recommended laboratory parameters are required.

Pregnancy Risk FactorC

Pregnancy ConsiderationsSafety and efficacy have not been established for pregnant women; use only if potential benefit to the mother outweighs possible risk to the fetus.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

1% to 10%:

Dermatologic: Alopecia (1%), dry skin (1%), exfoliative dermatitis (1%), maculopapular rash (1%), pruritus (1%)

Hematologic: Thrombocytopenia (3%), leukopenia (3%), porphyria (1%), epistaxis (1%)

Hepatic: Hepatic neoplasm (8%), hepatic failure (7%)

Ocular: Conjunctivitis (2%), corneal opacity (2%), keratitis (2%), photophobia (2%), cataracts (1%), blepharitis (1%), eye pain (1%)

<1%: Abdominal pain, amenorrhea, brain tumor, bronchitis, cyanosis, dehydration, diarrhea, enanthema, encephalopathy, gastritis, gastroenteritis, gastrointestinal hemorrhage, headache, hepatic dysfunction, hepatomegaly, hyperkinesias, infection, liver enzymes increased, melena, nervousness, otitis, pathologic fracture, respiratory insufficiency, seizure, septicemia, somnolence, thirst, tooth discoloration

Drug InteractionsThere are no known significant interactions.

Ethanol/Nutrition/Herb InteractionsFood: Effect of taking with food is unknown. Tyrosine toxicity can occur without proper dietary restriction of tyrosine and phenylalanine.

Monitoring Parameters

Dietary tyrosine and phenylalanine

Liver: Ultrasound, computerized tomography, magnetic resonance imaging

Ophthalmic exam: Slit-lamp examination prior to treatment; repeat during therapy in patients with photophobia, eye pain, redness, swelling, or burning of the eyes.

Plasma tyrosine: Levels should be kept <500 µmol/L to avoid toxicity.

Plasma succinylacetone: May take up to 3 months to normalize after start of therapy

Platelets, white blood cell counts

Serum alpha-fetoprotein: To monitor effectiveness of treatment and potential liver neoplasia.

Serum phosphate in patients with renal dysfunction

Urine succinylacetone: Should not be detectable during treatment; dose should be increased if detectable after the first month of treatment.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 2 mg, 5 mg, 10 mg

Generic AvailableNo

ManufacturerSwedish Orphan International AB

Mechanism of ActionIn patients with HT-1, tyrosine metabolism is interrupted due to a lack of the enzyme (fumarylacetoacetate hydrolase) needed in the last step of tyrosine degradation. Toxic metabolites of tyrosine accumulate and cause liver and kidney toxicity. Nitisinone competitively inhibits 4-hydroxyphenyl-pyruvate dioxygenase, an enzyme needed earlier in the tyrosine degradation pathway, and therefore prevents the build-up of the damaging metabolites.

Pharmacodynamics/KineticsLimited pharmacokinetic studies in children or HT-1 patients.

Bioavailability: Animal studies: >90%

Half-life elimination: Terminal: Male: Healthy: 54 hours

Time to peak: 3 hours

Excretion (animal studies): Urine

Pharmacotherapy PearlsUse has been associated with increased 2- to 4-year survival probabilities of HT-1 and lower risk of early onset hepatic failure.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay rarely cause nervousness

Mental Health: Effects on Psychiatric TreatmentMay cause leukopenia and thrombocytopenia; use caution with clozapine, carbamazepine, and valproic acid

International Brand NamesOrfadin (AT, BE, BG, CH, CZ, DE, DK, ES, FI, FR, GB, GR, HN, IE, IT, NL, NO, PT, RU, SE, TR, TW)

Nitrazepam

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(nye TRA ze pam)

Canadian Brand NamesApo-Nitrazepam®; Mogadon; Nitrazadon; Nitrazepam (Pro-Doc); Sandoz-Nitrazepam

Pharmacologic CategoryBenzodiazepine

Use: Labeled IndicationsShort-term management of insomnia; treatment of myoclonic seizures

Dosing: Adults**Insomnia:** Oral: 5-10 mg at bedtime; treatment should not exceed 7-10 consecutive days; use for more than 2-3 consecutive weeks requires complete re-evaluation of patient

Dosing: ElderlyInsomnia: Elderly or debilitated patients: Oral: 2.5-5 mg at bedtime

Dosing: Pediatric**Myoclonic seizures:** Children ≤30 kg: Oral: 0.3-1 mg/kg/day in 3 divided doses

Administration: OralAdminister at bedtime; tablets may be swallowed whole, crushed, or dissolved in liquid

StorageStore at room temperature. Protect from light and moisture.

RestrictionsCDSA IV; Not available in U.S.

ContraindicationsHypersensitivity to nitrazepam or any component of the formulation (cross sensitivity with other benzodiazepines may exist); myasthenia gravis; narrow-angle glaucoma; severe respiratory insufficiency; sleep apnea syndrome; severe hepatic insufficiency

Warnings/Precautions

Concerns related to adverse effects:

- Anterograde amnesia: Nitrazepam may induce anterograde amnesia; caution patients to ensure they have uninterrupted sleep of 7-8 hours after ingestion of dose.
- Aspiration pneumonia: Bronchial hypersecretion and excessive salivation/drooling leading to aspiration pneumonia in young and elderly patients may occur rarely.
- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Paradoxical reactions: Paradoxical reactions, including hyperactive or aggressive behavior, have been reported with benzodiazepines, particularly in adolescent/pediatric or psychiatric patients.

Disease-related concerns:

- Depression: Use caution in patients with depression, particularly if suicidal risk may be present.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with respiratory disease.

Concurrent drug therapy issues:

- CNS depressants/psychoactive medications: Use with caution in patients receiving other CNS depressants or psychoactive medication; effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Debilitated patients: Use with caution in debilitated patients
- Elderly: Use with caution in the elderly; benzodiazepines have been associated with falls and traumatic injury.
- Fall risk: Use with extreme caution in patients who are at risk of falls; benzodiazepines have been associated with falls and traumatic injury.
- Pediatrics: Associated with sudden death in children <5 years of age being treated for seizure disorders. Use should be restricted to children unresponsive to other antiepileptic agents. Safety and efficacy for use as a hypnotic not established in children <18 years of age.
- Pregnancy: Safety and efficacy in pregnancy and lactation have not been established.

Other warnings/precautions:

- Appropriate use: Does not have analgesic, antidepressant, or antipsychotic properties.
- Hypnotic: Appropriate use: Should be used only after evaluation of potential causes of sleep disturbance. Failure of sleep disturbance to resolve after 7-10 days may indicate psychiatric or medical illness. A worsening of insomnia or the emergence of new

abnormalities of thought or behavior may represent unrecognized psychiatric or medical illness and requires immediate and careful evaluation.

- Withdrawal: Rebound or withdrawal symptoms may occur following abrupt discontinuation or large decreases in dose. Use caution when reducing dose or withdrawing therapy; decrease slowly and monitor for withdrawal symptoms. Flumazenil may cause withdrawal in patients receiving long-term benzodiazepine therapy.

Geriatric ConsiderationsSince this medication has a moderately-long half-life, it is not a drug of choice for use in the elderly.

Pregnancy ConsiderationsNot recommended; crosses placenta: Benzodiazepine use during pregnancy is associated with increased risks of congenital malformations. Hypotonia, lethargy, feeding problems, and withdrawal symptoms have been reported with benzodiazepine use near time of delivery.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsClinical effects on the infant include sedation. With respect to other benzodiazepines, AAP reports that USE MAY BE OF CONCERN.

Adverse ReactionsFrequency not defined.

Cardiovascular: Hypotension, palpitation

Central nervous system: Agitation, aggressiveness, amnesia, ataxia, confusion, delusions, disorientation, dizziness, fatigue, hallucination, hangover, headache, irritability, nightmares, psychoses, rage, restlessness, sedation

Dermatologic: Rash

Endocrine & metabolic: Changes in libido

Gastrointestinal: Constipation, diarrhea, excessive salivation, heartburn, nausea, vomiting

Hematologic: Granulocytopenia, leukopenia

Neuromuscular & skeletal: Falling, muscle weakness

Ocular: Blurred vision, double vision

Otic: Tinnitus (associated with withdrawal)

Respiratory: Aspiration, bronchial hypersecretion, dyspnea

Drug Interactions

CNS depressants: Sedative effects and/or respiratory depression may be additive with CNS depressants; includes ethanol, barbiturates, opioid analgesics, and other sedative agents; monitor for increased effect.

Theophylline (and related compounds): May partially antagonize some of the effects of benzodiazepines; monitor for decreased response; may require higher doses for sedation.

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, kava kava, St John’s wort, gotu kola (may increase CNS depression).

Test InteractionsNitrazepam can cause a false elevation (about 15%) of clozapine serum levels

Monitoring ParametersRespiratory and cardiovascular status

Reference RangeSteady state levels after 4 days: 40 ng/mL

Nursing: Physical Assessment/MonitoringMonitor therapeutic response and adverse reactions at the beginning and periodically throughout therapy. May cause hypotension. Monitor blood pressure periodically. Assess other prescription and OTC medications the patient may be taking to avoid duplications and interactions. Assess knowledge/teach patient appropriate use, side effects, and symptoms to report.

Patient EducationInform prescriber of all prescription medications, OTC medications, or herbal products you are taking. Take as directed; this drug can be habit-forming. If taken for an extended period of time, do not stop taking medications abruptly. Consult your prescriber. Sedative effects may be additive when taken with other CNS depressants such as pain medications, antihistamines, sedatives, or hypnotics. Avoid alcohol use. Do not take any new medications without consulting prescriber. Only take this medication when you can plan to have 7-8 hours of uninterrupted sleep. May cause sedation, excitation, headache, nightmares, dizziness, fatigue, muscle weakness (use caution when driving or engaging in activities requiring alertness until response to drug is known), or changes in libido. Report continued insomnia; rapid heart beat; CNS effects such as hallucinations, psychoses, confusion, impaired coordination, or changes in personality; changes in your vision, hearing, or speech; or difficulty breathing. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Tablet:

Apo-Nitrazepam® [CAN], Mogadon [CAN], Nitrazadon [CAN], Nitrazepam [CAN], Sandoz-Nitrazepam [CAN]: 5 mg, 10 mg [not available in the U.S.]

Mechanism of ActionBinds to stereospecific benzodiazepine receptors on the postsynaptic GABA neuron at several sites within the CNS, including the limbic system, reticular formation. Enhancement of the inhibitory effect of GABA on neuronal excitability results by increased neuronal membrane permeability to chloride ions. This shift in chloride ions results in hyperpolarization (a less excitable state) and stabilization.

Pharmacodynamics/Kinetics

Onset of action: 20-50 minutes

Absorption: Rapid

Distribution: V_d: 2.4 L/kg, Elderly: 4.8 L/kg; also distributes into CSF, saliva, placenta

Protein binding: 87%

Metabolism: Hepatic: Nitroreduction, acetylation; no active metabolites

Bioavailability: ~80%

Half-life elimination: 30 hours, Elderly/ill patients: 40 hours

Time to peak, plasma: 2-3 hours

Excretion: Urine (65% to 70%, ~1% as unchanged drug); feces (14% to 20%)

Pharmacotherapy PearlsAbrupt discontinuation after sustained use may cause withdrawal symptoms.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Excessive salivation has been reported. The mechanism of this effect is unknown, since many benzodiazepines cause xerostomia rather than salivation excess.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions.

Mental Health CommentIn 2007, the FDA requested that all manufacturers of sedative-hypnotic drug products revise labeling to include a greater emphasis on the risks of adverse effects. These risks include severe allergic reactions (anaphylaxis, angioedema) and complex sleep-related behaviors, which may include sleep-driving (driving while not fully awake and with no memory of the event), making phone calls, and preparing and eating food while asleep.

There are two subtypes of GABA receptors (GABA-A and GABA-B) and three different benzodiazepine receptors (Bz_1, Bz_2, and Bz_3). Benzodiazepine receptors and effects appear to be linked to the GABA-A receptors. Benzodiazepines do not bind to GABA-B receptors. The role of GABA-B receptors is unclear. Benzodiazepines have no specificity for benzodiazepine receptor subtypes.

Nitrazepam is a long half-life benzodiazepine. Duration of action after a single dose is determined by redistribution rather than metabolism. Tolerance develops to the sedative, hypnotic, and anticonvulsant effects. It does not develop to the anxiolytic or skeletal muscle-relaxing effects. Psychological and physical dependence may occur with prolonged use of benzodiazepines. The onset of withdrawal symptoms is usually seen on the first day without drug and lasts 5-7 days in patients receiving short half-life benzodiazepines, whereas, the onset occurs after 5 days with a duration of 10-14 days after abrupt discontinuance of long half-life benzodiazepines. Risk factors for abuse include alcohol abuse, personality disorders in the patient or the patient's parent(s).

Nitrazepam is contraindicated in patients with sleep apnea and myasthenia gravis and should not be used alone to treat psychosis or depression. Concomitant use with psychotropics may produce additive sedative effects. Benzodiazepines have been associated with anterograde and retrograde amnesia.

Index TermsNitrozepamum

International Brand NamesAlodorm (AU); Alozepam (AU); Apodorm (NO, SE); Arem (ZA); Berlidorm (BG); Dormalon (DE); Dumolid (ID); Eunoctin (HN); Hipnax (PT); Hypnotex (IN); Imeson (DE); Insoma (NZ); Insomin (FI); Mogadon (AT, AU, BE, CH, DK, FR, HK, IT, MY, NL, NO, PK, SE, SG, TW); Nitavan (IN); Nitrados (NZ, PH); Nitrapan (BR); Nitravet (IN); Nitrazepam (PL); Nitrazepol (BR); Novanox (DE); Numbon (IL); Onirema (VE); Ormodon (ZA); Paxadorm (ZA); Radedorm (EE); Rohypnol (PL)

Nitric Oxide

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(NYE trik OKS ide)
U.S. Brand NamesINOmax®
Canadian Brand NamesINOmax®
Pharmacologic CategoryVasodilator, Pulmonary
Use: Labeled IndicationsTreatment of term and near-term (>34 weeks) neonates with hypoxic respiratory failure associated with pulmonary hypertension; used concurrently with ventilatory support and other agents
Use: Unlabeled/InvestigationalTreatment of adult respiratory distress syndrome (ARDS)
Dosing: PediatricNeonates (up to 14 days old): Inhalation: 20 ppm. Treatment should be maintained up to 14 days or until the underlying oxygen desaturation has resolved and the neonate is ready to be weaned from therapy. In the CINRGI trial, patients whose oxygenation improved had their dose reduced to 5 ppm at the end of 4 hours of treatment. Doses above 20 ppm should not be used because of the risk of methemoglobinemia and elevated NO_2.
Administration: InhalationIn the ventilated neonate, precise monitoring of inspired nitric oxide and NO_2 should be instituted using a calibrated analysis device with alarms. Sample gas for analysis should be drawn before the Y-piece, proximal to the patient. In addition, oxygen levels should be measured. A backup delivery system should be available in the event of power failure. Do not discontinue abruptly.
StorageStore at 25°C (77°C).
ContraindicationsHypersensitivity to nitric oxide or any component of the formulation; neonates dependent on right-to-left shunting of blood
Warnings/Precautions

Other warnings/precautions:

- Abrupt discontinuation: May lead to worsening hypotension, oxygenation, and increasing pulmonary artery pressure (PAP).
- Appropriate use: Doses above 20 ppm should not be used because of the increased risk of methemoglobinemia and elevated nitrogen dioxide (NO_2) levels. Methemoglobin levels and NO_2 should be monitored.
- Lack of response: Worsening oxygenation and increasing PAP may occur in patients who do not respond.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted.
LactationExcretion in breast milk unknown
Breast-Feeding ConsiderationsNitric oxide is not indicated for use in adults.
Adverse Reactions

>10%:

Cardiovascular: Hypotension (13%)

Miscellaneous: Withdrawal syndrome (12%)

1% to 10%:

Dermatologic: Cellulitis (5%)

Endocrine & metabolic: Hyperglycemia (8%)

Genitourinary: Hematuria (8%)

Respiratory: Atelectasis (9% - same as placebo), stridor (5%)

Miscellaneous: Sepsis (7%), infection (6%)

Postmarketing and/or case reports: Headache (environmental exposure, eg, hospital staff); hypoxemia; pulmonary edema (in CREST syndrome patients)

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersRespiratory status including arterial blood gases with close attention to PaO_2, methemoglobin, NO_2 , vital signs, blood sugar, signs and symptoms of infection.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Gas, for inhalation:

100 ppm [nitric oxide 0.01% and nitrogen 99.99%] (353 L) [delivers 344 L], (1963 L) [delivers 1918 L]

800 ppm [nitric oxide 0.08% and nitrogen 99.92%] (353 L) [delivers 344 L], (1963 L) [delivers 1918 L]

Generic AvailableNo

ManufacturerINO Therapeutics

Mechanism of ActionIn neonates with persistent pulmonary hypertension, nitric oxide improves oxygenation. Nitric oxide relaxes vascular smooth muscle by binding to the heme moiety of cytosolic guanylate cyclase, activating guanylate cyclase and increasing intracellular levels of cyclic guanosine 3',5'-monophosphate, which leads to vasodilation. When inhaled, pulmonary vasodilation occurs and an increase in the partial pressure of arterial oxygen results. Dilation of pulmonary vessels in well ventilated lung areas redistributes blood flow away from lung areas where ventilation/perfusion ratios are poor.

Pharmacodynamics/Kinetics

Absorption: Systemic after inhalation

Metabolism: Nitric oxide combines with hemoglobin that is 60% to 100% oxygenated. Nitric oxide combines with oxyhemoglobin to produce methemoglobin and nitrate. Within the pulmonary system, nitric oxide can combine with oxygen and water to produce nitrogen dioxide and nitrite respectively, which interact with oxyhemoglobin to then produce methemoglobin and nitrate. At 80 ppm the methemoglobin percent is ~5% after 8 hours of administration. Methemoglobin levels >7% were attained only in patients receiving 80 ppm.

Excretion: Urine (as nitrate)

Clearance: Nitrate: At a rate approaching the glomerular filtration rate

Pharmacotherapy PearlsElevations in methemoglobin and nitrogen dioxide may be signs of overdose. Elevated nitrogen dioxide may cause acute lung injury and elevations of methemoglobin reduce the oxygen delivery capacity of the circulation. NO_2 levels >3 ppm or methemoglobin levels >7% were treated by reducing the dose of or discontinuing INOmax®. Methemoglobinemia that does not resolve with dosage reduction or discontinuation of therapy may require intravenous vitamin C, intravenous methylene blue, or blood transfusion, depending on the clinical situation.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Nitrofurantoin

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

International issues:

Macrobid® may be confused with Mikrozid® which is a brand name for ethanol/propanol combination in Great Britain

Pronunciation(nye troe fyoor AN toyn)
U.S. Brand NamesFuradantin®; Macrobid®; Macrodantin®
Canadian Brand NamesApo-Nitrofurantoin®; Macrobid®; Macrodantin®; Novo-Furantoin
Pharmacologic CategoryAntibiotic, Miscellaneous
Use: Labeled IndicationsPrevention and treatment of urinary tract infections caused by susceptible strains of *E. coli*, *S. aureus, Enterococcus, Klebsiella,* and *Enterobacter*
Dosing: Adults

UTI treatment:

Furadantin®, Macrodantin®: Oral: 50-100 mg/dose every 6 hours; administer for 7 days or at least 3 days after obtaining sterile urine

Macrobid®: Oral: 100 mg twice daily for 7 days

UTI prophylaxis (Furadantin®, Macrodantin®): Oral: 50-100 mg/dose at bedtime

Dosing: ElderlyRefer to adult dosing (see Geriatric Considerations).
Dosing: Pediatric

UTI treatment:

Children >1 month (Furadantin®, Macrodantin®): Oral: 5-7 mg/kg/day in divided doses every 6 hours (maximum: 400 mg/day). Administer for 7 days or at least 3 days after obtaining sterile urine.

Children >12 years (Macrobid®): Oral: Refer to adult dosing.

UTI prophylaxis: Children >1 month (Furadantin®, Macrodantin®): Oral: 1-2 mg/kg/day in divided doses every 12-24 hours (maximum: 100 mg/day)

Dosing: Renal Impairment

Cl_{cr} <60 mL/minute: Contraindicated

Contraindicated in hemo- and peritoneal dialysis and continuous arteriovenous or venovenous hemofiltration.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralAdminister with meals to improve absorption and decrease adverse effects; suspension may be mixed with water, milk, fruit juice, or infant formula. Shake suspension well before use.
StorageStore at room temperature 15°C to 30°C (59°F to 86°F).
ContraindicationsHypersensitivity to nitrofurantoin or any component of the formulation; renal impairment (anuria, oliguria, significantly elevated serum creatinine, or Cl_{cr}< 60 mL/minute); infants <1 month (due to the possibility of hemolytic anemia); pregnancy at term (38-42 weeks gestation), during labor and delivery, or when the onset of labor is imminent
Allergy Considerations

- Furantoin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hepatic reactions: Rare, but severe hepatic reactions have been associated with use (onset may be insidious); discontinue immediately if hepatitis occurs.

- Peripheral neuropathy: Has been associated with peripheral neuropathy (rare); risk may be increased by renal impairment, diabetes, vitamin B deficiency, or electrolyte imbalance; use caution.

- Pulmonary toxicity: Acute, subacute, or chronic (usually after 6 months of therapy) pulmonary reactions have been observed; if these occur, discontinue therapy immediately. Monitor closely for malaise, dyspnea, cough, fever, radiologic evidence of diffuse interstitial pneumonitis or fibrosis.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Anemia: Use with caution in patients with anemia.

- Renal impairment: Therapeutic concentrations are not attained in urine of patients with Cl_{cr}<60 mL/minute.

Special populations:

- G6PD deficiency: Use with caution in patients with G6PD deficiency .

- Pediatrics: Safety and efficacy have not been established in children <1 month of age.

Geriatric ConsiderationsBecause of nitrofurantoin's decreased efficacy in patients with a Cl_{cr} <60 mL/minute and its side effect profile, it is not an antibiotic of choice for acute or prophylactic treatment of urinary tract infections in the elderly. An increased rate of severe hepatic toxicity has been suggested by postmarketing reports.

Pregnancy Risk FactorB (contraindicated at term)

Pregnancy ConsiderationsTeratogenic effects have not been observed in animal studies, however, may cause hemolytic anemia in infants. Use of nitrofurantoin is contraindicated at term (38-42 weeks gestation), during labor and delivery, or when the onset of labor is imminent.

LactationEnters breast milk/not recommended (infants <1 month); AAP rates “compatible”

Breast-Feeding ConsiderationsExcreted in trace amounts in breast milk; may cause hyperbilirubinemia or hemolytic anemia in infants (<1 month of age). AAP rates “compatible.” Use caution in G6PD deficiency.

Adverse ReactionsFrequency not defined.

Cardiovascular: Chest pain, cyanosis, ECG changes

Central nervous system: Bulging fontanels (infants), chills, confusion, depression, dizziness, drowsiness, fever, headache, malaise, pseudotumor cerebri, psychotic reaction, vertigo

Dermatologic: Alopecia, angioedema, erythema multiforme, exfoliative dermatitis, pruritus, rash (eczematous, erythematous, maculopapular), Stevens-Johnson syndrome, urticaria

Gastrointestinal: Abdominal pain, *C. difficile* colitis, constipation, diarrhea, dyspepsia, flatulence, nausea, pancreatitis, sialadenitis, vomiting

Hematologic: Agranulocytosis, eosinophilia, granulocytopenia, hemolytic anemia, leukopenia, megaloblastic anemia, thrombocytopenia

Hepatic: Cholestasis, hepatitis, hepatic necrosis, transaminases increased, jaundice (cholestatic)

Neuromuscular & skeletal: Arthralgia, myalgia, numbness, paresthesia, peripheral neuropathy, weakness

Ocular: Amblyopia, nystagmus, optic neuritis

Respiratory: Cough, dyspnea, pneumonitis, pulmonary fibrosis (with long-term use), pulmonary infiltration

Miscellaneous: Anaphylaxis, hypersensitivity (including acute pulmonary hypersensitivity), lupus-like syndrome

Drug Interactions

Norfloxacin: Nitrofurantoin may diminish the therapeutic effect of Norfloxacin. *Risk X: Avoid combination*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Nitrofurantoin serum concentrations may be increased if taken with food.

Test InteractionsFalse-positive urine glucose (Benedict's and Fehling's methods); no false positives with enzymatic tests

Monitoring ParametersSigns of pulmonary reaction, signs of numbness or tingling of the extremities, periodic liver function tests

Nursing: Physical Assessment/MonitoringAssess allergy history and renal status prior to beginning therapy. Assess results of laboratory tests, therapeutic effectiveness, and adverse response. Advise patients with diabetes about use of Clinitest® (may cause false-positive urine glucose). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsCBC, periodic liver function. Perform culture and sensitivity prior to initiating therapy.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take entire prescription, even if you are feeling better. Take with food. Suspension may be mixed with water, milk, fruit juice, or infant formula. Shake suspension well before use. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. If you have diabetes, drug may cause false test results with Clinitest® urine glucose monitoring; use of another type of glucose monitoring is preferable. May cause nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or diarrhea (buttermilk, boiled milk, or yogurt may help). Report immediately and rash; swelling of face, tongue, mouth, or throat; or chest tightness. Report if condition being treated worsens or does not improve by the time prescription is completed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule [macrocrystal]: 50 mg, 100 mg

Macrodantin®: 25 mg, 50 mg, 100 mg

Capsule [macrocrystal/monohydrate]: 100 mg [nitrofurantoin macrocrystal 25% and nitrofurantoin monohydrate 75%]

Macrobid®: 100 mg [nitrofurantoin macrocrystal 25% and nitrofurantoin monohydrate 75%]

Suspension, oral:

Furadantin®: 25 mg/5 mL (470 mL)

Generic AvailableYes: Excludes suspension

Pricing: U.S. (www.drugstore.com)

Capsules (Macrobid)

100 mg (20): $49.99

Capsules (Macrodantin)

25 mg (30): $36.99

50 mg (30): $45.99

100 mg (30): $68.99

Capsules (Nitrofurantoin Macrocrystal)

50 mg (30): $27.99

100 mg (30): $56.27

Capsules (Nitrofurantoin Monohyd Macro)

100 mg (20): $26.99

Suspension (Furadantin)

25 mg/5 mL (60): $77.04

Mechanism of ActionInhibits several bacterial enzyme systems including acetyl coenzyme A interfering with metabolism and possibly cell wall synthesis

Pharmacodynamics/Kinetics

Absorption: Well absorbed; macrocrystalline form absorbed more slowly due to slower dissolution (causes less GI distress)

Distribution: V_d: 0.8 L/kg; crosses placenta; enters breast milk

Protein binding: 60% to 90%

Metabolism: Body tissues (except plasma) metabolize 60% of drug to inactive metabolites

Bioavailability: Increased with food

Half-life elimination: 20-60 minutes; prolonged with renal impairment

Excretion:

Suspension: Urine (40%) and feces (small amounts) as metabolites and unchanged drug

Macrocrystals: Urine (20% to 25% as unchanged drug)

Related Information

- Antacid Drug Interactions

Medication Safety Issues

Sound-alike/look-alike issues:

Nitroglycerin may be confused with nitroprusside

Nitro-Bid® may be confused with Nicobid®

Nitroderm may be confused with NicoDerm®

Nitrol® may be confused with Nizoral®

Nitrostat® may be confused with Nilstat®, nystatin

Nitroglycerin transdermal patches should be removed prior to defibrillation or MRI study.

International issues:

Nitrocor® [Chile and Italy] may be confused with Natrecor® which is a brand name for nesiritide in the U.S.

Nitrocor® [Chile and Italy] may be confused with Nutracort® which is a brand name for hydrocortisone in the U.S.

Nitro-Dur® may be confused with Nitrocor® [Chile and Italy]

Pronunciation(nye troe GLI ser in)

U.S. Brand NamesMinitran™; Nitrek® [DSC]; Nitro-Bid®; Nitro-Dur®; Nitrolingual®; NitroQuick®; Nitrostat®; NitroTime®

Canadian Brand NamesGen-Nitro; Minitran™; Nitro-Dur®; Nitroglycerin Injection, USP; Nitrol®; Nitrostat™; Rho®-Nitro; Transderm-Nitro®; Trinipatch® 0.2; Trinipatch® 0.4; Trinipatch® 0.6

Pharmacologic CategoryVasodilator

Use: Labeled IndicationsTreatment of angina pectoris; I.V. for congestive heart failure (especially when associated with acute myocardial infarction); pulmonary hypertension; hypertensive emergencies occurring perioperatively (especially during cardiovascular surgery)

Use: Unlabeled/InvestigationalEsophageal spastic disorders (sublingual)

Dosing: Adults**Note:** Hemodynamic and antianginal tolerance often develop within 24-48 hours of continuous nitrate administration. Nitrate-free interval (10-12 hours/day) is recommended to avoid tolerance development; gradually decrease dose in patients receiving NTG for prolonged period to avoid withdrawal reaction.

Angina/coronary artery disease:

Oral: 2.5-9 mg 2-4 times/day (up to 26 mg 4 times/day)

I.V.: 5 mcg/minute, increase by 5 mcg/minute every 3-5 minutes to 20 mcg/minute. If no response at 20 mcg/minute increase by 10 mcg/minute every 3-5 minutes, up to 200 mcg/minute.

Topical ointment: Include a nitrate free interval, ~10 to 12 hours; Apply 0.5" to 2" every 6 hours with a nitrate free interval.

Topical patch, transdermal: 0.2-0.4 mg/hour initially and titrate to doses of 0.4-0.8 mg/hour. Tolerance is minimized by using a patch-on period of 12-14 hours and patch-off period of 10-12 hours.

Sublingual: 0.2-0.6 mg every 5 minutes for maximum of 3 doses in 15 minutes; may also use prophylactically 5-10 minutes prior to activities which may provoke an attack.

Esophageal spastic disorders (unlabeled use): 0.3-0.4 mg 5 minutes before meals

Translingual: 1-2 sprays into mouth under tongue every 3-5 minutes for maximum of 3 doses in 15 minutes, may also be used 5-10 minutes prior to activities which may provoke an attack prophylactically.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Pulmonary hypertension: I.V. Continuous infusion: Children: Start 0.25-0.5 mcg/kg/minute and titrate by 1 mcg/kg/minute at 20- to 60-minute intervals to desired effect; usual dose: 1-3 mcg/kg/minute; maximum: 5 mcg/kg/minute

Note: Hemodynamic and antianginal tolerance often develop within 24-48 hours of continuous nitrate administration.

Calculations

- Nitroglycerin
- Nitroglycerin: Pediatrics

Administration: I.V.I.V. must be prepared in glass bottles and use special sets intended for nitroglycerin. Glass I.V. bottles and administration sets provided by manufacturer.

Administration: I.V. DetailNitroglycerin can be absorbed by plastic (polyvinyl chloride) tubing or containers. Infusion pump may not infuse accurately with different tubing. Be alert to potential for unregulated flow.

pH: 3.0-6.5

Administration: Oral

Sublingual: Do not crush sublingual product (tablet). Place under tongue and allow to dissolve.

Translingual spray: Do not shake container. Release spray onto or under tongue. Do not rinse the mouth for at least 5-10 minutes. Priming sprays should be directed away from patient and others. The end of the pump should be covered by the fluid in the bottle.

Nitrolingual®: Prime prior to first use (5 sprays into the air). If unused for 6 weeks, a single priming spray should be completed.

StorageDoses should be made in glass bottles, Excel® or PAB® containers. Adsorption occurs to soft plastic (eg, PVC). Nitroglycerin diluted in D_5W or NS in glass containers is physically and chemically stable for 48 hours at room temperature and 7 days under refrigeration. In D_5W or NS in Excel®/PAB® containers it is physically and chemically stable for 24 hours at room temperature and 14 days under refrigeration. Premixed bottles are stable according to the manufacturer's expiration dating. Store sublingual tablets and ointment in tightly closed containers at 15°C to 30°C. Store spray and transdermal patch at 25°C; excursions permitted to 15°C to 30°C (59°F to 86°F).

Reconstitution

Standard diluent: 50 mg/250 mL D_5W; 50 mg/500 mL D_5W.

Minimum volume: 100 mg/250 mL D_5W; concentration should not exceed 400 mcg/mL.

CompatibilityStable in D_5LR, $D_5{}^1/_2NS$, D_5NS, LR, ${}^1/_2NS$; **variable stability (consult detailed reference)** in D_5W, NS.

Y-site administration: Compatible: Alatrofloxacin, amiodarone, amphotericin B cholesteryl sulfate complex, atracurium, cisatracurium, diltiazem, dobutamine, dobutamine with dopamine, dobutamine with lidocaine, dobutamine with sodium nitroprusside, dopamine, dopamine with lidocaine, dopamine with sodium nitroprusside, epinephrine, esmolol, famotidine, fentanyl, fluconazole, furosemide, gatifloxacin, haloperidol, heparin, hydromorphone, inamrinone, insulin (regular), labetalol, lidocaine, lidocaine with sodium nitroprusside, linezolid, lorazepam, midazolam, milrinone, morphine, nicardipine, norepinephrine, pancuronium, propofol, ranitidine, remifentanil, sodium nitroprusside, streptokinase, tacrolimus, theophylline, thiopental, vecuronium, warfarin. **Incompatible:** Alteplase, levofloxacin. **Variable (consult detailed reference):** Hydralazine.

Compatibility in syringe: Compatible: Heparin.

Compatibility when admixed: Dose is variable and may require titration, therefore, it is not advisable to mix with other agents. **Compatible:** Alteplase, aminophylline, dobutamine, dopamine, enalaprilat, furosemide, lidocaine, verapamil. **Incompatible:** Hydralazine, phenytoin. **Variable (consult detailed reference):** Bretylium, dobutamine with sodium nitroprusside.

ContraindicationsHypersensitivity to organic nitrates; hypersensitivity to isosorbide, nitroglycerin, or any component of the formulation; concurrent use with phosphodiesterase-5 (PDE-5) inhibitors (sildenafil, tadalafil, or vardenafil); angle-closure glaucoma (intraocular pressure may be increased); head trauma or cerebral hemorrhage (increase intracranial pressure); severe anemia; allergy to adhesive (transdermal product)

Additional contraindications for I.V. product: Hypotension; uncorrected hypovolemia; inadequate cerebral circulation; constrictive pericarditis; pericardial tamponade

Allergy Considerations

- Nitrate Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hypotension/bradycardia: Severe hypotension can occur; paradoxical bradycardia and increased angina pectoris can accompany hypotension. Orthostatic hypotension can also occur; ethanol can accentuate this. Use with caution in volume depletion, hypotension, and right ventricular infarctions.

Disease-related concerns:

- Hypertrophic cardiomyopathy: Use with caution in patients with hypertrophic cardiomyopathy; nitrates may reduce preload, exacerbating obstruction and cause hypotension and/or worsening of heart failure.

Concurrent drug therapy issues:

- PDE-5 inhibitors: Avoid concurrent use with PDE-5 inhibitors (eg, sildenafil, tadalafil, vardenafil).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Long-acting agents: Avoid use of long-acting agents in acute MI or HF; cannot easily reverse if adverse events develop.
- Transdermal patches: Patches should be removed prior to defibrillation or MRI study.

Other warnings/precautions:

- Tolerance: Appropriate dosing is needed to minimize tolerance development.

Geriatric ConsiderationsCaution should be used when using nitrate therapy in the elderly due to hypotension. Hypotension is enhanced in the elderly due to decreased baroreceptor response, decreased venous tone, and often hypovolemia (dehydration) or other hypotensive drugs.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

Frequency not always defined:

Cardiovascular: Hypotension (4%), postural hypotension, crescendo angina (2%), tachycardia, flushing, peripheral edema

Central nervous system: Headache (most common; 50% to 63%), lightheadedness (6%), syncope (4%), dizziness

Gastrointestinal: Nausea, vomiting, bowel incontinence, xerostomia

Genitourinary: Urinary incontinence

Ocular: Blurred vision

Miscellaneous: Diaphoresis

<1% (Limited to important or life-threatening): Allergic reactions, application site irritation (patch), cardiovascular collapse, exfoliative dermatitis, methemoglobinemia (rare; overdose), pallor, palpitation, rash, rebound hypertension, restlessness, shock, vertigo, weakness

Drug Interactions

Alteplase: Nitroglycerin may decrease the serum concentration of Alteplase. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Heparin: Nitroglycerin may diminish the anticoagulant effect of Heparin. Nitroglycerin may decrease the serum concentration of Heparin. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Phosphodiesterase 5 Inhibitors: May enhance the vasodilatory effect of Vasodilators (Organic Nitrates). *Risk X: Avoid combination*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Rosiglitazone: Vasodilators (Organic Nitrates) may enhance the adverse/toxic effect of Rosiglitazone. Specifically, a greater risk of myocardial ischemia was reported for users of this combination in a meta-analysis. Management: Consider alternatives to this combination when possible. Rosiglitazone prescribing information states that the combination of rosiglitazone and a nitrate is not recommended. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase the hypotensive effects of nitroglycerin). Monitor.

Herb/Nutraceutical: Avoid bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (american), kola, licorice (may worsen hypertension). Avoid black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse (may cause hypotension).

Monitoring ParametersBlood pressure, heart rate

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents patient may be taking (eg, heparin, ergot alkaloids, sildenafil, tadalafil, or vardenafil). See Administration specifics for different formulations. Evaluate therapeutic effectiveness (cardiac status) and adverse response (eg, hypotension, arrhythmias, CNS changes, GI disturbances). Dose should be reduced gradually when discontinuing after long-term therapy. Teach patient proper use (according to purpose and formulation), possible side effects/appropriate interventions (eg, drug-free intervals; removes transdermal patches for specific period of time), and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as per directions (see below). Do not change brands without consulting prescriber. Do not discontinue abruptly. Keep medication in original container, tightly closed. If anginal chest pain is unresolved in 15 minutes, seek emergency medical help at once. Daily use may cause dizziness or lightheadedness (use caution when driving or engaging in hazardous activities until response to drug is known); headache (consult prescriber for approved analgesic);

hypotension (use care when changing position from sitting or lying to standing, when climbing stairs or when engaging in tasks that are potentially hazardous until response to drug is known); GI disturbances (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report acute headache, rapid heartbeat, unusual restlessness or dizziness, muscular weakness, or blurred vision or seeing abnormal colors. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Oral: Take as directed. Do not chew or swallow sublingual tablets; allow to dissolve under tongue. Sit down before using sublingual or buccal tablet or spray form. Do not chew or crush extended release capsules; swallow with 8 oz of water.

Spray: Follow exact instructions in product insert. Spray directly on mucous membranes; do not inhale.

Topical: Spread prescribed amount thinly on applicator; rotate application sites.

Transdermal: Use as directed; place on hair-free area of skin, rotate sites (usually, patches will be removed for a period each day)

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, extended release: 2.5 mg, 6.5 mg, 9 mg

Nitro-Time®: 2.5 mg, 6.5 mg, 9 mg

Infusion [premixed in D_5W]: 25 mg (250 mL) [0.1 mg/mL]; 50 mg (250 mL) [0.2 mg/mL]; 50 mg (500 mL) [0.1 mg/mL]; 100 mg (250 mL) [0.4 mg/mL]; 200 mg (500 mL) [0.4 mg/mL]

Injection, solution: 5 mg/mL (5 mL, 10 mL) [contains ethanol and propylene glycol]

Ointment, topical:

Nitro-Bid®: 2% [20 mg/g] (1 g, 30 g, 60 g)

Solution, translingual [spray]:

Nitrolingual®: 0.4 mg/metered spray (4.9 g) [contains ethanol 20%; 60 metered sprays]; (12 g) [contains ethanol 20%; 200 metered sprays]; (16.9 g) [contains ethanol 20%; 260 metered sprays]

Tablet, sublingual: 0.3 mg, 0.4 mg, 0.6 mg

NitroQuick®, Nitrostat®: 0.3 mg, 0.4 mg, 0.6 mg

Transdermal system [once-daily patch]: 0.1 mg/hour (30s); 0.2 mg/hour (30s); 0.4 mg/hour (30s); 0.6 mg/hour (30s)

Minitran™: 0.1 mg/hour (30s); 0.2 mg/hour (30s); 0.4 mg/hour (30s); 0.6 mg/hour (30s)

Nitrek®: 0.2 mg/hour (30s); 0.4 mg/hour (30s); 0.6 mg/hour (30s) [DSC]

Nitro-Dur®: 0.1 mg/hour (30s); 0.2 mg/hour (30s); 0.3 mg/hour (30s); 0.4 mg/hour (30s); 0.6 mg/hour (30s); 0.8 mg/hour (30s)

Generic AvailableYes: Capsule, injection, patch, tablet

Sublingual (NitroTab)

0.4 mg (25): $8.99

Mechanism of ActionWorks by relaxation of smooth muscle, producing a vasodilator effect on the peripheral veins and arteries with more prominent effects on the veins. Primarily reduces cardiac oxygen demand by decreasing preload (left ventricular end-diastolic pressure); may modestly reduce afterload; dilates coronary arteries and improves collateral flow to ischemic regions

Pharmacodynamics/Kinetics

Onset of action: Sublingual tablet: 1-3 minutes; Translingual spray: 2 minutes; Sustained release: 20-45 minutes; Topical: 15-60 minutes; Transdermal: 40-60 minutes; I.V. drip: Immediate

Peak effect: Sublingual tablet: 4-8 minutes; Translingual spray: 4-10 minutes; Sustained release: 45-120 minutes; Topical: 30-120 minutes; Transdermal: 60-180 minutes; I.V. drip: Immediate

Duration: Sublingual tablet: 30-60 minutes; Translingual spray: 30-60 minutes; Sustained release: 4-8 hours; Topical: 2-12 hours; Transdermal: 18-24 hours; I.V. drip: 3-5 minutes

Protein binding: 60%

Metabolism: Extensive first-pass effect

Half-life elimination: 1-4 minutes

Excretion: Urine (as inactive metabolites)

Related Information

- Hemodynamic Support, Intravenous
- Hypertension
- Nitrates

Pharmacotherapy PearlsI.V. preparations contain alcohol and/or propylene glycol; may need to use nitrate-free interval (10-12 hours/day) to avoid tolerance development. Tolerance may possibly be reversed with acetylcysteine; gradually decrease dose in patients receiving NTG for prolonged period to avoid withdrawal reaction.

Concomitant use of sildenafil (Viagra®) or other phosphodiesterase-5 enzyme inhibitors (PDE-5) may precipitate acute hypotension, myocardial infarction, or death. Nitrates used in right ventricular infarction may induce acute hypotension. Nitrate use in severe pericardial effusion may reduce cardiac filling pressure and precipitate cardiac tamponade. In the management of heart failure, the combination of isosorbide dinitrate and hydralazine confers beneficial effects on disease progression and cardiac outcomes.

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause dizziness

Mental Health: Effects on Psychiatric Treatment None reported, but monitor for hypotension if receiving a psychotropic

Cardiovascular Considerations Nitrates improve the balance between myocardial oxygen supply and demand, primarily by decreasing oxygen demand. Nitrates decreases myocardial oxygen demand by reducing preload via dilation of peripheral veins. Nitrates improve myocardial oxygen supply by dilating epicardial coronary arteries and collateral vessels, leaving resistance vessels alone. Nitrates are unlikely to induce a coronary steal syndrome. Nitrates improve exercise tolerance in stable angina patients. An adequate nitroglycerin-free period must be provided with all nitrate products to prevent nitrate tolerance from developing. In the treatment of unstable angina/non-ST-segment elevation MI, I.V. NTG is indicated for immediate relief of ischemia when sublingual nitroglycerin (tablet or spray) and intravenous beta-blocker have failed. I.V. NTG may also be of benefit in nonhypotensive high-risk patients. Caution should be observed if administering nitrates to individuals who are volume-depleted or are experiencing a right ventricular infarction. Additionally, nitrates should not be given to an individual who has received a phosphodiesterase-5 enzyme inhibitor within the past 24 hours. In a stabilized patient, intravenous nitroglycerin should be converted within 24 hours to a nonparenteral alternative in a regimen that is designed to prevent tolerance.

The 2004 STEMI guidelines suggest that healthcare providers should instruct patients, with sublingual nitroglycerin on hand, to take one dose sublingually in response to chest discomfort/pain. If chest pain is unimproved or worsening 5 minutes after the dose has been taken, the patient or family should call an ambulance. Use I.V. nitroglycerin for relief of ongoing ischemic discomfort (if S.L. nitroglycerin has been ineffective), control of hypertension, or management of pulmonary congestion. Nitrates should not be used if hypotension limits the addition of a beta-blocker.

Anesthesia and Critical Care Concerns/Other Considerations Nitroglycerin 5 mg/mL contains propylene glycol 518 mg/mL (30% v/v).

In the treatment of unstable angina/non-ST-segment elevation MI, nitroglycerin (sublingual tablet or spray), followed by intravenous administration, is recommended for immediate relief of ischemia and associated symptoms. Note that nitrate use may result in significant hypotension in individuals who are volume depleted.

Nitrate use in right ventricular infarction may induce acute hypotension. Nitrate use in severe pericardial effusion may reduce cardiac filling pressure and precipitate cardiac tamponade.

Index Terms Glyceryl Trinitrate; Nitroglycerol; NTG

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Nitroprusside may be confused with nitroglycerin

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(nye troe PRUS ide)

U.S. Brand NamesNitropress®

Pharmacologic CategoryVasodilator

Use: Labeled IndicationsManagement of hypertensive crises; congestive heart failure; used for controlled hypotension to reduce bleeding during surgery

Dosing: Adults

Acute hypertension: I.V.: Initial: 0.3-0.5 mcg/kg/minute; increase in increments of 0.5 mcg/kg/minute, titrating to the desired hemodynamic effect or the appearance of headache or nausea; usual dose: 3 mcg/kg/minute; rarely need >4 mcg/kg/minute; maximum: 10 mcg/kg/minute. When >500 mcg/kg is administered by prolonged infusion of faster than 2 mcg/kg/minute, cyanide is generated faster than an unaided patient can handle.

Note: Administration requires the use of an infusion pump. Average dose: 5 mcg/kg/minute.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Pulmonary hypertension: I.V.: Children: Initial: 1 mcg/kg/minute by continuous I.V. infusion; increase in increments of 1 mcg/kg/minute at intervals of 20-60 minutes; titrating to the desired response; usual dose: 3 mcg/kg/minute, rarely need >4 mcg/kg/minute; maximum: 5 mcg/kg/minute.

Note: Administration requires the use of an infusion pump. Average dose: 5 mcg/kg/minute.

Dosing: Renal ImpairmentLimit use; accumulation of thiocyanate may occur.

Dosing: Hepatic ImpairmentLimit use; risk of cyanide toxicity.

Calculations

- Nitroprusside

Administration: I.V.I.V. infusion only, use only as an infusion with 5% dextrose in water. Infusion pump required. Not for direct injection.

Administration: I.V. DetailContinuously monitor patient's blood pressure.

pH: 3.5-6.0

Storage

Use only clear solutions; solutions of nitroprusside exhibit a color described as brownish, brown, brownish-pink, light orange, and straw. Solutions are highly sensitive to light. Exposure to light causes decomposition, resulting in a highly colored solution of orange, dark brown or blue. **A blue color indicates almost complete degradation and breakdown to cyanide.**

Solutions should be wrapped with aluminum foil or other opaque material to protect from light (do as soon as possible).

Stability of parenteral admixture at room temperature (25°C) and at refrigeration temperature (4°C) is 24 hours.

ReconstitutionBrownish solution is usable, discard if bluish in color. Nitroprusside sodium should be reconstituted freshly by diluting 50 mg in 250-1000 mL of D_5W.

CompatibilityStable in LR; **variable stability (consult detailed reference)** in D_5W, NS.

Y-site administration: Compatible: Atracurium, diltiazem, dobutamine, dobutamine with dopamine, dobutamine with lidocaine, dobutamine with nitroglycerin, dopamine, dopamine with lidocaine, dopamine with nitroglycerin, enalaprilat, esmolol, famotidine, heparin, inamrinone, indomethacin, insulin (regular), labetalol, lidocaine, lidocaine with nitroglycerin, midazolam, milrinone, morphine, nitroglycerin, pancuronium, propofol, tacrolimus, theophylline, vecuronium. **Incompatible:** Levofloxacin. **Variable (consult detailed reference):** Cisatracurium, haloperidol, TPN.

Compatibility in syringe: Compatible: Heparin.

Compatibility when admixed: Compatible: Cimetidine, enalaprilat, ranitidine, verapamil. **Incompatible:** Atracurium. **Variable (consult detailed reference):** Dobutamine with nitroglycerin.

ContraindicationsHypersensitivity to nitroprusside or any component of the formulation; treatment of compensatory hypertension (aortic coarctation, arteriovenous shunting); high output failure; congenital optic atrophy or tobacco amblyopia

Warnings/Precautions

Boxed warnings:

- Administration: See "Other warnings/precautions" below.
- Continuous monitoring: See "Other warnings/precautions" below.
- Cyanide toxicity: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Cyanide toxicity: **[U.S. Boxed Warning]: Except when used briefly or at low (<2 mcg/kg/minute) infusion rates, nitroprusside gives rise to large cyanide quantities. Do not use the maximum dose for more than 10 minutes; if blood pressure is not controlled then discontinue infusion. Monitor for cyanide toxicity via acid-base balance and venous oxygen concentration.**
- Thiocyanate toxicity: Can occur in patients with renal impairment or those on prolonged infusions.

Disease-related concerns:

- Increased intracranial pressure: Use with extreme caution in patients with elevated intracranial pressure.
- Hepatic impairment: Use with extreme caution in patients with hepatic impairment.
- Renal impairment: Use with extreme caution in patients with renal impairment; use the lowest end of the dosage range.

Other warnings/precautions:

- Administration: **[U.S. Boxed Warning]: Should not be administered by direct injection; must be further diluted with 5% dextrose in water.**
- Continuous monitoring: **[U.S. Boxed Warning]: Continuous blood pressure monitoring is needed.**

Geriatric ConsiderationsElderly patients may have an increased sensitivity to nitroprusside possibly due to a decreased baroreceptor reflex, altered sensitivity to vasodilating effects or a resistance of cardiac adrenergic receptors to stimulation by catecholamines.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown

Adverse Reactions1% to 10%:

Cardiovascular: Excessive hypotensive response, palpitation, substernal distress

Central nervous system: Disorientation, psychosis, headache, restlessness

Endocrine & metabolic: Thyroid suppression

Gastrointestinal: Nausea, vomiting

Neuromuscular & skeletal: Weakness, muscle spasm

Otic: Tinnitus

Respiratory: Hypoxia

Miscellaneous: Diaphoresis, thiocyanate toxicity

Drug Interactions

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Calcium Channel Blockers: May enhance the hypotensive effect of Nitroprusside. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Monitoring ParametersBlood pressure, heart rate; monitor for cyanide and thiocyanate toxicity; monitor acid-base status as acidosis can be the earliest sign of cyanide toxicity; monitor thiocyanate levels if requiring prolonged infusion (>3 days) or dose ≥4 mcg/kg/minute or patient has renal dysfunction; monitor cyanide blood levels in patients with decreased hepatic function; cardiac monitor and blood pressure monitor required

Reference RangeMonitor thiocyanate levels if requiring prolonged infusion (>4 days) or ≥4 mcg/kg/minute; not to exceed 100 mcg/mL (or 10 mg/dL) plasma thiocyanate

Thiocyanate:

Therapeutic: 6-29 mcg/mL

Toxic: 35-100 mcg/mL

Fatal: >200 mcg/mL

Cyanide: Normal <0.2 mcg/mL; normal (smoker): <0.4 mcg/mL

Toxic: >2 mcg/mL

Potentially lethal: >3 mcg/mL

Nursing: Physical Assessment/MonitoringSee Administration and Reconstitution for infusion specifics and warnings. Infusion site must be monitored closely to prevent extravasation. Continuous patient monitoring (including blood pressure) is needed. Evaluate patient response and assess adverse reactions (eg, acid/base balance [metabolic acidosis is early sign of cyanide toxicity], disorientation, hypoxia, muscular twitching). Provide patient teaching according to patient condition.

Patient EducationPatient condition should indicate extent of education and instruction needed. This drug can only be given I.V. You will be monitored at all times during infusion. Promptly report any chest pain or pain/burning at site of infusion. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as sodium: 25 mg/mL (2 mL)

Generic AvailableYes

Mechanism of ActionCauses peripheral vasodilation by direct action on venous and arteriolar smooth muscle, thus reducing peripheral resistance; will increase cardiac output by decreasing afterload; reduces aortal and left ventricular impedance

Pharmacodynamics/Kinetics

Onset of action: BP reduction <2 minutes

Duration: 1-10 minutes

Metabolism: Nitroprusside is converted to cyanide ions in the bloodstream; decomposes to prussic acid which in the presence of sulfur donor is converted to thiocyanate (hepatic and renal rhodanase systems)

Half-life elimination: Parent drug: <10 minutes; Thiocyanate: 2.7-7 days

Excretion: Urine (as thiocyanate)

Related Information

- Hemodynamic Support, Intravenous
- Hypertension

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause restlessness, disorientation, or psychosis

Mental Health: Effects on Psychiatric TreatmentNone reported, but monitor for hypotension if receiving a psychotropic

Cardiovascular ConsiderationsThiocyanate levels should be monitored if high doses are used for more than 24 hours, particularly in patients with renal dysfunction and hepatic dysfunction. Nitroprusside is a very effective agent for controlled blood pressure lowering because of the very short half-life. Reasonably accurate titrations, based on target blood pressure, can be achieved. Because of restricted cardiac output conditions, nitroprusside should be avoided in patients with aortic stenosis or coarctation. Nitroprusside should also be used cautiously in patients with acute myocardial infarction because of hemodynamic effects and possible coronary steal.

Acute Decompensated Heart Failure: Nitroprusside may also be useful for short-term afterload reduction in patients with acute decompensated heart failure. Patients with refractory end-stage heart failure, once stabilized, should be switched to an oral regimen that can maintain symptomatic improvement and reduce the risk of subsequent deterioration if possible.

Anesthesia and Critical Care Concerns/Other ConsiderationsElderly patients may have an increased sensitivity to nitroprusside possibly due to a decreased baroreceptor reflex, altered sensitivity to vasodilating effects or a resistance of cardiac adrenergic receptors to stimulation by catecholamines.

Thiocyanate levels should be monitored if high doses are used for more than 24 hours. Nitroprusside may also be useful for afterload reduction in patients with severe heart failure. Nitroprusside should be avoided in patients with aortic stenosis or coarctation. Nitroprusside should also be used cautiously in patients with acute myocardial infarction, because of hemodynamic effects and possible coronary steal.

Management of Intracerebral Hemorrhage (ICH): Rapid identification of patients experiencing ICH is essential and should be considered a medical emergency due to the progressive deterioration, severe clinical deficits, and high mortality and morbidity. Treatment for ICH has evolved rapidly in recent years. According to the 2007 ACC/AHA Guidelines for the Management of Spontaneous Intracerebral Hemorrhage in Adults, patients with ICH should be treated in a balanced and graded approach with therapies that reduce intracranial pressure (ICP) (eg, mannitol, hypertonic saline solutions, barbiturate coma, head of bed elevation) (Class IIa recommendation). Direct monitoring of ICP and central perfusion pressure (CPP) may be necessary if patient is treated more aggressively. Treatment of ICH with recombinant factor VIIa (rFVIIa) within the first 3-4 hours after onset to slow progression of bleeding has shown promise; however, at this time it cannot be routinely recommended in all patients experiencing ICH (Class IIb recommendation).

Blood pressure (BP) management in patients who are hypertensive is also of paramount importance in treating ICH. The primary rationale for lowering BP is to prevent further progression of the bleed. This can be accomplished using a number of different pharmacologic treatments (eg, nicardipine, labetalol, nitroprusside). Nitroprusside may increase ICP due to the pronounced vasodilatory actions and as a result may be less preferable. Specific BP targets are not supported by available evidence. The 2007 ACC/AHA Guidelines recommend initiating antihypertensive therapy if the SBP >180 mm Hg or if MAP >130 mm Hg.

Index TermsNitroprusside Sodium; Sodium Nitroferricyanide; Sodium Nitroprusside

English English

Jump To Field (Select Field Name)

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(NYE trus OKS ide)

Pharmacologic CategoryDental Gases; General Anesthetic

Use: Labeled IndicationsProduces sedation and analgesia; principal adjunct to inhalation and intravenous general anesthesia

Use: DentalInduction of sedation and analgesia in anxious dental patients

Dosing: Adults

Surgical sedation and analgesia: Concentrations of 25% to 50% nitrous oxide with oxygen. For general anesthesia, concentrations of 40% to 70% via mask or endotracheal tube. Minimal alveolar concentration (MAC), which can be considered the ED_{50} of inhalational anesthetics, is 105%; therefore delivery in a hyperbaric chamber is necessary to use as a complete anesthetic. When administered at 70%, reduces the MAC of other anesthetics by half.

Dental: Sedation and analgesia: Concentrations of 25% to 50% nitrous oxide with oxygen

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

ContraindicationsHypersensitivity to nitrous oxide or any component of the formulation; nitrous oxide should not be administered without oxygen; should not be given to patients after a full meal

Warnings/Precautions

Concerns related to adverse effects:

- Addictive: May be associated with abuse and/or addiction.
- Bone marrow suppression: Prolonged use may produce bone marrow suppression; patients with vitamin B_{12} deficiency (pernicious anemia) and those with other nutritional deficiencies (alcoholics) are at increased risk.
- Nausea/vomiting: Occurs postoperatively in ~15% of patients.
- Neurologic effects: Prolonged use may produce neurologic dysfunction; patients with vitamin B_{12} deficiency (pernicious anemia) and those with other nutritional deficiencies (alcoholics) are at increased risk.

Other warnings/precautions:

- Oxygen use: Oxygen should be briefly administered during emergence from prolonged anesthesia with nitrous oxide to prevent diffusion hypoxia.

Pregnancy Risk FactorNo data reported

Adverse ReactionsAn increased risk of renal and hepatic diseases and peripheral neuropathy similar to that of vitamin B_{12} deficiency have been reported in dental personnel who work in areas where nitrous oxide is frequently used without an enclosed gas scavenging system

Methionine synthase, a vitamin B_{12} dependent enzyme, is inactivated following prolonged administration of nitrous oxide, and the subsequent interference with DNA synthesis prevents production of both leukocytes and red blood cells by bone marrow. These effects do not occur within the time frame of clinical use.

Female dental personnel who were exposed to unscavenged nitrous oxide for more than 5 hours/week were significantly less fertile than women who were not exposed, or who were exposed to lower levels of scavenged or unscavenged nitrous oxide. Fertility was measured by the number of menstrual cycles, without use of contraception, required to become pregnant. Women who were exposed to nitrous oxide for more than 5 hours/week were only 41% as likely as unexposed women to conceive during each monthly cycle.

Frequency not defined:

Cardiovascular: Hypotension

Central nervous system: Headache, dizziness, confusion, CNS excitation

Gastrointestinal: Possibly nausea and vomiting

Respiratory: Apnea

Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Supplied in blue cylinders

Generic AvailableYes
Mechanism of ActionGeneral CNS depressant action; may act similarly as inhalant general anesthetics by stabilizing axonal membranes to partially inhibit action potentials leading to sedation; may partially act on opiate receptor systems to cause mild analgesia; central sympathetic stimulating action supports blood pressure, systemic vascular resistance, and cardiac output; it does not depress carbon dioxide drive to breath. Nitrous oxide increases cerebral blood flow and intracranial pressure while decreasing hepatic and renal blood flow; has analgesic action similar to morphine.
Pharmacodynamics/Kinetics

Onset of action: Inhalation: 2-5 minutes

Absorption: Rapid via lungs; blood/gas partition coefficient is 0.47

Metabolism: Body: <0.004%

Excretion: Primarily exhaled gases; skin (minimal amounts)

Pharmacotherapy PearlsNitrous oxide's central sympathetic stimulating action supports blood pressure, systemic vascular resistance, and cardiac output. It does not depress carbon dioxide drive to breath. It increases cerebral blood flow and intracranial pressure while decreasing hepatic and renal blood flow; has analgesic action similar to morphine.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause confusion, dizziness, or excitation
Mental Health: Effects on Psychiatric TreatmentNone reported
Anesthesia and Critical Care Concerns/Other ConsiderationsNitrous oxide's central sympathetic stimulating action supports blood pressure, systemic vascular resistance, and cardiac output. It does not depress carbon dioxide drive to breathe. It increases cerebral blood flow and intracranial pressure while decreasing hepatic and renal blood flow. Nitrous oxide has analgesic action similar to morphine.

Medication Safety Issues

Sound-alike/look-alike issues:

Axid® may be confused with Ansaid®

International issues:

Tazac® [Australia] may be confused with Tiazac® which is a brand name for diltiazem in the U.S.

Pronunciation(ni ZA ti deen)
U.S. Brand NamesAxid®; Axid® AR [OTC]
Canadian Brand NamesApo-Nizatidine®; Axid®; Gen-Nizatidine; Novo-Nizatidine; Nu-Nizatidine; PMS-Nizatidine
Pharmacologic CategoryHistamine H_2 Antagonist
Use: Labeled IndicationsTreatment and maintenance of duodenal ulcer; treatment of benign gastric ulcer; treatment of gastroesophageal reflux disease (GERD); OTC tablet used for the prevention of meal-induced heartburn, acid indigestion, and sour stomach
Use: Unlabeled/InvestigationalPart of a multidrug regimen for *H. pylori* eradication to reduce the risk of duodenal ulcer recurrence
Dosing: Adults

Duodenal ulcer: Oral:

Treatment of active ulcer: 300 mg at bedtime or 150 mg twice daily

Maintenance of healed ulcer: 150 mg/day at bedtime

Gastric ulcer: Oral: 150 mg twice daily or 300 mg at bedtime

GERD: Oral: 150 mg twice daily

Meal-induced heartburn, acid indigestion, and sour stomach (OTC labeling): Oral: 75 mg tablet [OTC] twice daily, 30-60 minutes prior to consuming food or beverages

Eradication of*Helicobacter pylori*(unlabeled use): Oral: 150 mg twice daily; requires combination therapy

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

GERD (unlabeled use): Oral:

Children <12 years: 10 mg/kg/day in divided doses given twice daily; may not be as effective in children <12 years

Children ≥12 years: Refer to adult dosing.

Meal-induced heartburn, acid indigestion and sour stomach: Oral: Children ≥12 years: Refer to adult dosing.

Dosing: Renal Impairment

Active treatment:

Cl_{cr} 20-50 mL/minute: 150 mg/day

Cl_{cr} <20 mL/minute: 150 mg every other day

Maintenance treatment:

Cl_{cr} 20-50 mL/minute: 150 mg every other day

Cl_{cr} <20 mL/minute: 150 mg every 3 days

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

ContraindicationsHypersensitivity to nizatidine or any component of the formulation; hypersensitivity to other H_2 antagonists (cross-sensitivity has been observed)
Allergy Considerations

- Histamine H_2 Antagonist Allergy

Warnings/Precautions

Disease-related concerns:

- Gastric malignancy: Relief of symptoms does not preclude the presence of a gastric malignancy.
- Hepatic impairment: Use with caution in patients with hepatic impairment; dosage adjustment recommended.
- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment recommended.

Special populations:

- Pediatrics: Use with caution in children <12 years of age.

Geriatric Considerations H_2 blockers are the preferred drugs for treating peptic ulcer disorder (PUD) in the elderly due to cost and ease of administration. These agents are no less or more effective than any other therapy. The preferred agents (due to side effects and drug interaction profile and pharmacokinetics) are ranitidine, famotidine, and nizatidine. Treatment for PUD in the elderly is recommended for 12 weeks since their lesions are larger, and therefore, take longer to heal. Always adjust dose based upon creatinine clearance.

Pregnancy Risk Factor B

Pregnancy Considerations Teratogenic effects were not observed in animal studies.

Lactation Enters breast milk/may be compatible

Breast-Feeding Considerations The amount of nizatidine excreted in breast milk is 0.1%.

Adverse Reactions

>10%: Central nervous system: Headache (16%)

1% to 10%:

Central nervous system: Anxiety, dizziness, fever (reported in children), insomnia, irritability (reported in children), somnolence, nervousness

Dermatologic: Pruritus, rash

Gastrointestinal: Abdominal pain, anorexia, constipation, diarrhea, dry mouth, flatulence, heartburn, nausea, vomiting

Respiratory: Reported in children: Cough, nasal congestion, nasopharyngitis

<1% (Limited to important or life-threatening): Alkaline phosphatase increased, ALT increased, anaphylaxis, anemia, AST increased, bronchospasm, confusion, eosinophilia, exfoliative dermatitis, gynecomastia, hepatitis, jaundice, laryngeal edema, serum-sickness like reactions, thrombocytopenia, thrombocytopenic purpura, vasculitis, ventricular tachycardia

Metabolism/Transport Effects **Inhibits** 3A4 (weak)

Drug Interactions

Antifungal Agents (Azole Derivatives, Systemic): H2-Antagonists may decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). **Exceptions:** Miconazole; Voriconazole. *Risk D: Consider therapy modification*

Atazanavir: H2-Antagonists may decrease the absorption of Atazanavir. *Risk D: Consider therapy modification*

Cefpodoxime: H2-Antagonists may decrease the absorption of Cefpodoxime. Separate oral doses by at least 2 hours. *Risk C: Monitor therapy*

Cefuroxime: H2-Antagonists may decrease the absorption of Cefuroxime. Separate oral doses by at least 2 hours. *Risk C: Monitor therapy*

Dasatinib: H2-Antagonists may decrease the absorption of Dasatinib. *Risk D: Consider therapy modification*

Erlotinib: H2-Antagonists may decrease the serum concentration of Erlotinib. *Risk X: Avoid combination*

Fosamprenavir: H2-Antagonists may decrease the serum concentration of Fosamprenavir. Cimetidine may also inhibit the metabolism of the active metabolite amprenavir, making its effects on fosamprenavir/amprenavir concentrations difficult to predict. *Risk C: Monitor therapy*

Indinavir: H2-Antagonists may decrease the serum concentration of Indinavir. *Risk C: Monitor therapy*

Iron Salts: H2-Antagonists may decrease the absorption of Iron Salts. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk C: Monitor therapy*

Mesalamine: H2-Antagonists may diminish the therapeutic effect of Mesalamine. This appears to be formulation-related and specific to the Apriso brand of mesalamine. Management: One specific formulation of mesalamine (i.e., Apriso-brand capsules containing coated granules) should not be administered with antacids; H2-antagonists would be expected to interact in a similar manner. *Risk X: Avoid combination*

Nelfinavir: H2-Antagonists may decrease the serum concentration of Nelfinavir. Concentrations of the active M8 metabolite may also be reduced. *Risk C: Monitor therapy*

Saquinavir: H2-Antagonists may increase the serum concentration of Saquinavir. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may cause gastric mucosal irritation).

Food: Administration with apple juice may decrease absorption.

Test InteractionsFalse-positive urine protein using Multistix®, gastric acid secretion test, skin tests allergen extracts, serum creatinine and serum transaminase concentrations, urine protein test

Nursing: Physical Assessment/MonitoringAssess therapeutic effectiveness and adverse response. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed; do not change dose or discontinue without consulting prescriber. Do not take within 1 hour of any antacids. Follow diet instructions of prescriber. May cause drowsiness; use caution when driving or engaging in tasks that require alertness until response to drug is known. Report fever, sore throat, tarry stools, CNS changes, or muscle or joint pain. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Axid®: 150 mg, 300 mg [DSC]

Solution, oral:

Axid®: 15 mg/mL (120 mL, 480 mL) [bubble gum flavor]

Tablet:

Axid® AR: 75 mg

Generic AvailableYes: Capsule

ManufacturerEli Lilly and Co

Pricing: U.S. (www.drugstore.com)

Capsules (Axid)

150 mg (60): $172.97

Capsules (Nizatidine)

150 mg (60): $51.98

300 mg (30): $53.99

Solution (Axid)

15 mg/mL (480): $326.98

Tablets (Axid AR)

75 mg (30): $9.99

75 mg (50): $13.50

Mechanism of ActionCompetitive inhibition of histamine at H$_2$-receptors of the gastric parietal cells resulting in reduced gastric acid secretion, gastric volume and hydrogen ion concentration reduced. In healthy volunteers, nizatidine suppresses gastric acid secretion induced by pentagastrin infusion or food.

Pharmacodynamics/Kinetics

Distribution: V$_d$: 0.8-1.5 L/kg

Protein binding: 35% to α_1-acid glycoprotein

Metabolism: Partially hepatic; forms metabolites

Bioavailability: >70%

Half-life elimination: 1-2 hours; prolonged with renal impairment

Time to peak, plasma: 0.5-3.0 hours

Excretion: Urine (90%; ~60% as unchanged drug); feces (<6%)

Pharmacotherapy PearlsGiving dose at 6 PM (rather than 10 PM) may better suppress nocturnal acid secretion

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness or drowsiness; may rarely cause insomnia

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine

Nonoxynol 9

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Delfen® may be confused with Delsym®

Pronunciation(non OKS i nole nine)

U.S. Brand NamesAdvantage-S® [OTC]; Conceptrol® [OTC]; Delfen® [OTC]; Encare® [OTC]; Gynol II® Extra Strength [OTC] ; Gynol II® [OTC]; Today® [OTC]; VCF™ [OTC]

Pharmacologic CategoryContraceptive; Spermicide

Use: Labeled IndicationsPrevention of pregnancy

Dosing: Adults**Note:** Prior to use, refer to specific product labeling for complete instructions.

Prevention of pregnancy: Vaginal:

Advantage-S®, Conceptrol®: Insert 1 applicatorful vaginally up to 1 hour prior to intercourse

Encare®: Unwrap and insert 1 suppository vaginally at least 10 minutes prior to intercourse; effective for 1 hour

Today® Sponge: Insert 1 sponge vaginally prior to intercourse; allow to remain in place for 6 hours after intercourse before removing; effective for use up to 24 continuous hours. Do not leave in place for >30 hours.

VCF®:

Film: Insert 1 film vaginally at least 15 minutes, but no more than 3 hours, prior to intercourse. Insert new film for each act of intercourse or if more than 3 hours have elapsed.

Foam: Insert 1 applicatorful at least 15 minutes prior to intercourse; effective for up to 1 hour

Dosing: ElderlyRefer to adult dosing.

Administration: Other

Today® Sponge: Prior to use, wet sponge with clean water and squeeze gently until sudsy in order to activate spermicide. Fold sponge in half with dimple side inside and string loop on bottom end, then insert into vagina. May be inserted up to 24 hours prior to intercourse. Sponge should not be reinserted if it accidentally falls out (insert new sponge).

VCF®:

Film: Remove film from pouch and fold in half; insert vaginally using finger.

Foam: Shake well prior to use.

ContraindicationsHypersensitivity to nonoxynol 9 or any component of the formulation

Today® Sponge: Hypersensitivity to sulfites; use within 6 weeks after giving birth; history of toxic shock syndrome; use during menstrual period

Warnings/Precautions

Concerns related to adverse effects:

- Toxic shock syndrome: Has been reported with barrier contraceptive use.
- Vaginal irritation: May cause vaginal irritation (eg, burning, itching or rash); irritation may also be present without symptoms. Irritation may be associated with an increased risk of getting HIV from an infected partner.

Dosage form specific issues:

- Today® Sponge: Prior to use, patients should consult healthcare provider following recent miscarriage or abortion, or with vaginal or uterine conditions which may make the product ineffective (eg, vaginal septum, uterine prolapse).

Other warnings/precautions:

- Appropriate use: Patients should consult with healthcare provider concerning the best form of birth control. For use in persons with only one partner and when neither partner is infected with HIV or has HIV risk factors; may be used with or without a diaphragm or condom.
- HIV infection protection: Nonoxynol 9 does not protect against HIV infection or other sexually-transmitted diseases and use may increase the risk of getting HIV from an infected partner. Not for use in persons with HIV or those who have a sexual partner with HIV; another form of birth control should be used. Proper use of a latex condom will help reduce the risk of infection from HIV.
- Rectal use: Not for use as a microbicide or lubricant during anal intercourse. Rectal use may cause irritation, which may increase the risk

of getting HIV from an infected partner.

Adverse Reactions Frequency not defined: Genitourinary: Irritation, burning, or itching of mucous membranes (including vaginal/urethral)

Drug Interactions There are no known significant interactions.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Aerosol, vaginal [foam]:

Delfen®: 12.5% (18 g) [contains benzoic acid]

VCF™: 12.5% (40 g)

Film, vaginal:

VCF™: 28% (3s, 6s,12s)

Gel, vaginal:

Advantage-S®: 3.5% (1.5 g) [packaged in 3s or with 6 prefilled applicators]; (30g) [packaged with reusable applicator]

Conceptrol®: 4% (2.7 g) [packaged in 6s and 10s with disposable applicators]

Gynol II®: 2% (85 g, 114 g)

Gynol II® Extra Strength: 3% (85.5 g)

Sponge, vaginal:

Today®: 1 g (3s, 6s, 12s) [contains benzoic acid, sodium metabisulfite]

Suppository, vaginal:

Encare®: 100 mg (12s, 18s)

Generic Available No

Mechanism of Action

Nonoxynol 9 is a surfactant which prevents pregnancy by damaging the cell membrane of sperm; some product formulations may also provide a physical barrier

Pharmacotherapy Pearls

The CDC does not recommend the use of condoms lubricated with spermicides due to increased cost, shorter shelf-life, and association with urinary tract infections in young women.

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment None reported

Index Terms N-9

Norepinephrine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(nor ep i NEF rin)

U.S. Brand NamesLevophed®

Canadian Brand NamesLevophed®

Pharmacologic CategoryAlpha/Beta Agonist

Use: Labeled IndicationsTreatment of shock which persists after adequate fluid volume replacement

Dosing: Adults**Note:** Norepinephrine dosage is stated in terms of norepinephrine base and intravenous formulation is norepinephrine bitartrate.

Norepinephrine bitartrate 2 mg = norepinephrine base 1 mg

Hypotension/shock: Continuous I.V. infusion:

Adults: Initial: 0.5-1 mcg/minute and titrate to desired response; 8-30 mcg/minute is usual range; range used in clinical trials: 0.01-3 mcg/kg/minute;

ACLS dosing range: 0.5-30 mcg/minute

Rate of infusion: 4 mg in 500 mL D_5W

2 mcg/minute = 15 mL/hour

4 mcg/minute = 30 mL/hour

6 mcg/minute = 45 mL/hour

8 mcg/minute = 60 mL/hour

10 mcg/minute = 75 mL/hour

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Administration requires the use of an infusion pump**

Note: Norepinephrine dosage is stated in terms of norepinephrine base and intravenous formulation is norepinephrine bitartrate.

Norepinephrine bitartrate 2 mg = Norepinephrine base 1 mg

Hypotension/shock: Continuous I.V. infusion: Children: Initial: 0.05-0.1 mcg/kg/minute; titrate to desired effect; maximum dose: 1-2 mcg/kg/minute

Calculations

- Norepinephrine
- Norepinephrine, Weight-Based

Administration: I.V.Administer into large vein to avoid the potential for extravasation; potent drug, must be diluted prior to use; do not administer $NaHCO_3$ through an I.V. line containing norepinephrine. Central line administration is required. Do not administer $NaHCO_3$ through an I.V. line containing norepinephrine.

Administration: I.V. DetailAdminister into large vein to avoid the potential for extravasation. Potent drug, must be diluted prior to use.

Extravasation management: Use phentolamine as antidote. Mix 5 mg with 9 mL of NS. Inject a small amount of this dilution into extravasated area. Blanching should reverse immediately. Monitor site; if blanching should recur, additional injections of phentolamine may be needed.

pH: 3.0-4.5

StorageReadily oxidized. Protect from light. Do not use if brown coloration. Stability of parenteral admixture at room temperature (25°C) is 24 hours.

ReconstitutionDilute with D_5W or D_5NS, but not recommended to dilute in normal saline.

CompatibilityStable in D_5NS, D_5W, LR; **incompatible** with normal saline, alkaline solutions.

Y-site administration: Compatible: Amiodarone, cisatracurium, diltiazem, dobutamine, dopamine, epinephrine, esmolol, famotidine, fentanyl, furosemide, haloperidol, heparin, hydrocortisone sodium succinate, hydromorphone, inamrinone, labetalol, lorazepam, meropenem, midazolam, milrinone, morphine, nicardipine, nitroglycerin, potassium chloride, propofol, ranitidine, remifentanil, vecuronium, vitamin B complex with C. **Incompatible:** Insulin (regular), thiopental.

Compatibility in syringe: Compatible: Heparin.

Compatibility when admixed: Compatible: Amikacin, calcium chloride, calcium gluconate, cimetidine, corticotropin, dimenhydrinate, dobutamine, heparin, hydrocortisone sodium succinate, magnesium sulfate, meropenem, methylprednisolone sodium succinate, multivitamins, potassium chloride, succinylcholine, verapamil, vitamin B complex with C. **Incompatible:** Aminophylline, amobarbital, chlorothiazide, chlorpheniramine, pentobarbital, phenobarbital, phenytoin, sodium bicarbonate, streptomycin, thiopental. **Variable (consult detailed reference):** Nafcillin, ranitidine.

ContraindicationsHypersensitivity to norepinephrine, bisulfites (contains metabisulfite), or any component of the formulation; hypotension from hypovolemia except as an emergency measure to maintain coronary and cerebral perfusion until volume could be replaced; mesenteric or peripheral vascular thrombosis unless it is a lifesaving procedure; during anesthesia with cyclopropane or halothane anesthesia (risk of ventricular arrhythmias)

Warnings/Precautions

Boxed warnings:

- Extravasation: See “Other warnings/precautions” below.

Concurrent drug therapy issues:

- Monoamine oxidase inhibitors (MAO-I): Use with extreme caution in patients taking MAO-Inhibitors; prolong hypertension may result from concurrent use.

Dosage form specific issues:

- Sodium metasulfite: Product may contain sodium metasulfite.

Other warnings/precautions:

- Appropriate use: Assure adequate circulatory volume to minimize need for vasoconstrictors. Avoid hypertension; monitor blood pressure closely and adjust infusion rate.
- Extravasation: Avoid extravasation; infuse into a large vein if possible. Avoid infusion into leg veins. Watch I.V. site closely. **[U.S. Boxed Warning]: If extravasation occurs, infiltrate the area with diluted phentolamine (5-10 mg in 10-15 mL of saline) with a fine hypodermic needle. Phentolamine should be administered as soon as possible after extravasation is noted.**

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown

Adverse ReactionsFrequency not defined.

Cardiovascular: Bradycardia, arrhythmia, peripheral (digital) ischemia

Central nervous system: Headache (transient), anxiety

Local: Skin necrosis (with extravasation)

Respiratory: Dyspnea, respiratory difficulty

Drug Interactions

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Beta-Blockers: May enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. *Risk D: Consider therapy modification*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

COMT Inhibitors: May decrease the metabolism of COMT Substrates. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Primarily with oral administration of phenylephrine. *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the tachycardic effect of Alpha-/Beta-Agonists. Serotonin/Norepinephrine Reuptake Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). *Risk D: Consider therapy modification*

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking. Monitor blood pressure and cardiac status, CNS status, skin temperature and color during and following infusion. Monitor fluid status. Assess infusion site frequently for extravasation. Blanching along vein pathway is a preliminary sign of extravasation.

Patient EducationThis drug is used in emergency situations. Patient information is based on patient condition.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as bitartrate: 1 mg/mL (4 mL) [contains sodium metabisulfite]

Generic AvailableYes

Mechanism of ActionStimulates beta$_1$-adrenergic receptors and alpha-adrenergic receptors causing increased contractility and heart rate as well as vasoconstriction, thereby increasing systemic blood pressure and coronary blood flow; clinically alpha effects (vasoconstriction) are greater than beta effects (inotropic and chronotropic effects)

Pharmacodynamics/Kinetics

Onset of action: I.V.: Very rapid-acting

Duration: vasopressor: 1-2 minutes

Metabolism: Via catechol-o-methyltransferase (COMT) and monoamine oxidase (MAO)

Excretion: Urine (84% to 96% as inactive metabolites)

Related Information

- Hemodynamic Support, Intravenous

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause anxiety, dizziness, or insomnia

Mental Health: Effects on Psychiatric TreatmentMonitor for increased pressor effect when used with TCAs, MAO inhibitors, and antihistamines

Anesthesia and Critical Care Concerns/Other ConsiderationsNorepinephrine is effective at increasing arterial blood pressure through vasoconstriction with little change in heart rate or cardiac output. Adequate fluid resuscitation is essential to the success of norepinephrine in raising blood pressure; may successfully increase blood pressure without causing a deterioration in cardiac index or organ function in patients with septic shock. It should be used early and not withheld as a last resort. The 2008 Surviving Sepsis Campaign guidelines recommend that either norepinephrine or dopamine is the first-choice vasopressor agent in adult patients (Grade 1C). Norephinephrine is more potent than dopamine and may be more effective at reversing hypotension in septic shock.

Index TermsLevarterenol Bitartrate; Noradrenaline; Noradrenaline Acid Tartrate; Norepinephrine Bitartrate

Pronunciation(nor eth IN drone & MES tra nole)

U.S. Brand NamesNecon® 1/50; Norinyl® 1+50; Ortho-Novum® 1/50 [DSC]

Canadian Brand NamesOrtho-Novum® 1/50

Pharmacologic CategoryContraceptive; Estrogen and Progestin Combination

Use: Labeled IndicationsPrevention of pregnancy

Use: Unlabeled/InvestigationalTreatment of hypermenorrhea (menorrhagia); pain associated with endometriosis; dysmenorrhea; dysfunctional uterine bleeding

Dosing: AdultsFemale: Contraception: Oral:

Schedule 1 (Sunday starter): Dose begins on first Sunday after onset of menstruation; if the menstrual period starts on Sunday, take first tablet that very same day. **With a Sunday start, an additional method of contraception should be used until after the first 7 days of consecutive administration.**

For 21-tablet package: Dosage is 1 tablet daily for 21 consecutive days, followed by 7 days off of the medication; a new course begins on the 8th day after the last tablet is taken.

For 28-tablet package: Dosage is 1 tablet daily without interruption.

Schedule 2 (Day 1 starter): Dose starts on first day of menstrual cycle taking 1 tablet daily.

For 21-tablet package: Dosage is 1 tablet daily for 21 consecutive days, followed by 7 days off of the medication; a new course begins on the 8th day after the last tablet is taken.

For 28-tablet package: Dosage is 1 tablet daily without interruption.

Note: If all doses have been taken on schedule and one menstrual period is missed, continue dosing cycle. If two consecutive menstrual periods are missed, pregnancy test is required before new dosing cycle is started.

Missed doses: Monophasic formulations (refer to package insert for complete information):

One dose missed: Take as soon as remembered or take 2 tablets next day

Two consecutive doses missed in the first 2 weeks: Take 2 tablets as soon as remembered or 2 tablets next 2 days. **An additional method of contraception should be used for 7 days after missed dose.**

*Two consecutive doses missed in week 3 or three consecutive doses missed at any time:***An additional method of contraception must be used for 7 days after a missed dose:**

Schedule 1 (Sunday starter): Continue dose of 1 tablet daily until Sunday, then discard the rest of the pack, and a new pack should be started that same day.

Schedule 2 (Day 1 starter): Current pack should be discarded, and a new pack should be started that same day.

Dosing: PediatricFemale: Contraception: Oral: See adult dosing; not to be used prior to menarche.

Dosing: Renal ImpairmentSpecific guidelines not available; use with caution and monitor blood pressure closely. Consider other forms of contraception.

Dosing: Hepatic ImpairmentContraindicated in patients with hepatic impairment.

Administration: OralAdminister at the same time each day. Administer at bedtime to minimize occurrence of adverse effects.

Dietary ConsiderationsShould be taken at same time each day.

StorageStore at controlled room temperature of 25°C (77°F).

ContraindicationsHypersensitivity to mestranol, norethindrone, or any component of the formulation; history of or current thrombophlebitis or venous thromboembolic disorders (including DVT, PE); active or recent (within 1 year) arterial thromboembolic disease (eg, stroke, MI); cerebral vascular disease, coronary artery disease, valvular heart disease with complications, severe hypertension; diabetes mellitus with vascular involvement; severe headache with focal neurological symptoms; known or suspected breast carcinoma, endometrial cancer, estrogen-dependent neoplasms, undiagnosed abnormal genital bleeding; hepatic dysfunction or tumor, cholestatic jaundice of pregnancy, jaundice with prior combination hormonal contraceptive use; major surgery with prolonged immobilization; heavy smoking (≥15 cigarettes/day) in patients >35 years of age; pregnancy

Allergy Considerations

- Estrogen Allergy

Warnings/Precautions

Boxed warnings:

- Smokers: See “Special populations” below.

Concerns related to adverse effects:

- Breast cancer: The use of combination hormonal contraceptives has been associated with a slight increase in frequency of breast cancer, however, studies are not consistent.

- Glucose intolerance: Combination hormonal contraceptives may cause glucose intolerance.

- Lipid effects: Combination hormonal contraceptives may effect serum triglyceride and lipoprotein levels. Estrogen compounds are generally associated with lipid effects such as increased HDL-cholesterol and decreased LDL-cholesterol. Triglycerides may also be increased; use with caution in patients with familial defects of lipoprotein metabolism.

- Retinal vascular thrombosis: Estrogens may cause retinal vascular thrombosis (has been reported rarely with combination hormonal contraceptives); discontinue permanently if papilledema or retinal vascular lesions are observed on examination.

- Thromboembolism: May increase the risk of thromboembolism.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with risk factors for coronary artery disease; may lead to increased risk of myocardial infarction. May have a dose-related risk of vascular disease and hypertension; women with hypertension should be encouraged to use a nonhormonal form of contraception.

- Depression: Use with caution in patients with depression.

- Diseases exacerbated by fluid retention: Use with caution in patients with diseases which may be exacerbated by fluid retention, including asthma, epilepsy, migraine, diabetes or renal dysfunction.

- Gallbladder disease: May have a dose-related risk of gallbladder disease.

- Migraine: Use with caution in patients with a history of migraine.

- Renal impairment: Women with renal disease should be encouraged to use a nonhormonal form of contraception.

Special populations:

- Pediatrics: Not for use prior to menarche.

- Smokers: **[U.S. Boxed Warning]: The risk of cardiovascular side effects increases in women who smoke cigarettes, especially those who are >35 years of age; women who use combination hormonal contraceptives should be strongly advised not to smoke.**

- Surgical patients: Whenever possible, should be discontinued at least 4 weeks prior to and for 2 weeks following elective surgery associated with an increased risk of thromboembolism or during periods of prolonged immobilization.

Other warnings/precautions:

- HIV infection protection: Combination hormonal contraceptives do not protect against HIV infection or other sexually-transmitted diseases.

- Minimum effective dosage: The minimum dosage combination of estrogen/progestin that will effectively treat the individual patient should be used. New patients should be started on products containing ≤0.035 mg of estrogen per tablet.

Pregnancy Risk FactorX

Pregnancy ConsiderationsPregnancy should be ruled out prior to treatment and discontinued if pregnancy occurs. In general, the use of combination hormonal contraceptives when inadvertently taken early in pregnancy have not been associated with teratogenic effects. Due to increased risk of thromboembolism postpartum, combination hormonal contraceptives should not be started earlier than 4-6 weeks following delivery. Hormonal contraceptives may be less effective in obese patients. An increase in oral contraceptive failure was noted in women with a BMI >27.3. Similar findings were noted in patients weighing ≥90 kg (198 lb) using the contraceptive patch.

LactationEnters breast milk/not recommended (AAP rates “compatible”)

Breast-Feeding ConsiderationsJaundice and breast enlargement in the nursing infant have been reported following the use of combination hormonal contraceptives. May decrease the quality and quantity of breast milk; a nonhormonal form of contraception is recommended.

Adverse ReactionsFrequency not defined.

Cardiovascular: Arterial thromboembolism, cerebral hemorrhage, cerebral thrombosis, edema, hypertension, mesenteric thrombosis, MI

Central nervous system: Depression, dizziness, headache, migraine, nervousness, premenstrual syndrome, stroke

Dermatologic: Acne, erythema multiforme, erythema nodosum, hirsutism, loss of scalp hair, melasma (may persist), rash (allergic)

Endocrine & metabolic: Amenorrhea, breakthrough bleeding, breast enlargement, breast secretion, breast tenderness, carbohydrate intolerance, lactation decreased (postpartum), glucose tolerance decreased, libido changes, menstrual flow changes, sex hormone-binding globulins (SHBG) increased, spotting, temporary infertility (following discontinuation), thyroid-binding globulin increased, triglycerides increased

Gastrointestinal: Abdominal cramps, appetite changes, bloating, cholestasis, colitis, gallbladder disease, jaundice, nausea, vomiting, weight gain/loss

Genitourinary: Cervical erosion changes, cervical secretion changes, cystitis-like syndrome, vaginal candidiasis, vaginitis

Hematologic: Antithrombin III decreased, folate levels decreased, hemolytic uremic syndrome, norepinephrine induced platelet aggregability increased, porphyria, prothrombin increased; factors VII, VIII, IX, and X increased

Hepatic: Benign liver tumors, Budd-Chiari syndrome, cholestatic jaundice, hepatic adenomas

Local: Thrombophlebitis

Ocular: Cataracts, change in corneal curvature (steepening), contact lens intolerance, optic neuritis, retinal thrombosis

Renal: Impaired renal function

Respiratory: Pulmonary thromboembolism

Miscellaneous: Hemorrhagic eruption

Metabolism/Transport Effects

Mestranol: **Substrate** of CYP2C9 (major); Based on active metabolite ethinyl estradiol: **Substrate** of CYP3A4 (major), 3A5-7 (minor); **Inhibits** CYP1A2 (weak), 2B6 (weak), 2C19 (weak), 3A4 (weak)

Norethindrone: **Substrate** of CYP3A4 (major); **Induces** CYP2C19 (weak)

Drug Interactions

Acitretin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Aminoglutethimide: May increase the metabolism of Progestins. *Risk D: Consider therapy modification*

Aprepitant: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Aprepitant: May decrease the serum concentration of Contraceptive (Progestins). *Risk D: Consider therapy modification*

Armodafinil: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Oral Contraceptive (Estrogens) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Oral Contraceptive (Progestins) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

CarBAMazepine: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

CarBAMazepine: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Colesevelam: May decrease the serum concentration of Norethindrone. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Estrogen Derivatives may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Darunavir: May decrease the serum concentration of Norethindrone. *Risk D: Consider therapy modification*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Felbamate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Felbamate: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Fosaprepitant: May decrease the serum concentration of Oral Contraceptive (Estrogens). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Fosaprepitant: May decrease the serum concentration of Contraceptive (Progestins). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Griseofulvin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Griseofulvin: May increase the metabolism of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Herbs (Estrogenic Properties): May enhance the adverse/toxic effect of Estrogen Derivatives. *Risk C: Monitor therapy*

Herbs (Progestogenic Properties) (eg, Bloodroot, Yucca): May enhance the adverse/toxic effect of Progestins. *Risk C: Monitor therapy*

LamoTRIgine: Oral Contraceptive (Estrogens) may decrease the serum concentration of LamoTRIgine. *Risk D: Consider therapy modification*

Modafinil: May decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Mycophenolate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Average AUC values were unchanged, but there was evidence of substantial patient-to-patient variability in response to this combination. *Risk D: Consider therapy modification*

Mycophenolate: May decrease the serum concentration of Oral Contraceptive (Progestins). *Risk D: Consider therapy modification*

Nafcillin: May increase the metabolism of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

OXcarbazepine: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

OXcarbazepine: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Phenytoin: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Phenytoin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Protease Inhibitors: Oral Contraceptive (Estrogens) may diminish the therapeutic effect of Protease Inhibitors. Protease Inhibitors may decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Retinoic Acid Derivatives: May diminish the therapeutic effect of Oral Contraceptive (Progestins). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk C: Monitor therapy*

Retinoic Acid Derivatives: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May decrease the serum concentration of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Ropinirole: Estrogen Derivatives may increase the serum concentration of Ropinirole. *Risk C: Monitor therapy*

Rufinamide: May decrease the serum concentration of Norethindrone. *Risk D: Consider therapy modification*

Selegiline: Oral Contraceptive (Estrogens) may increase the serum concentration of Selegiline. *Risk D: Consider therapy modification*

Selegiline: Oral Contraceptive (Progestins) may increase the serum concentration of Selegiline. *Risk D: Consider therapy modification*

St Johns Wort: May diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

St Johns Wort: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Thyroid Products: Estrogen Derivatives may diminish the therapeutic effect of Thyroid Products. *Risk C: Monitor therapy*

Tipranavir: Estrogen Derivatives may enhance the dermatologic adverse effect of Tipranavir. The combination of tipranavir/ritonavir and ethinyl estradiol/norethindrone was associated with a high incidence of skin rash. Tipranavir may decrease the serum concentration of Estrogen Derivatives. *Risk D: Consider therapy modification*

TiZANidine: Oral Contraceptive (Estrogens) may increase the serum concentration of TiZANidine. *Risk C: Monitor therapy*

Topiramate: May decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Oral Contraceptive (Estrogens) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Contraceptive (Progestins) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Voriconazole: May decrease the metabolism of Oral Contraceptive (Estrogens). Oral Contraceptive (Estrogens) may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Voriconazole: May decrease the metabolism of Oral Contraceptive (Progestins). Oral Contraceptive (Progestins) may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: CNS effects of caffeine may be enhanced if oral contraceptives are used concurrently with caffeine. Grapefruit juice increases ethinyl estradiol concentrations and would be expected to increase progesterone serum levels as well; clinical implications are unclear.

Herb/Nutraceutical: St John's wort may decrease the effectiveness of combination hormonal contraceptives by inducing hepatic enzymes. Avoid dong quai and black cohosh (have estrogen activity). Avoid saw palmetto, red clover, ginseng.

Monitoring ParametersBefore starting therapy, a physical exam with reference to the breasts and pelvis are recommended, including a Papanicolaou smear. Exam may be deferred if appropriate; pregnancy should be ruled out prior to use. Monitor patient closely for loss of vision; sudden onset of proptosis, diplopia, or migraine; blood pressure; signs and symptoms of thromboembolic disorders; signs or symptoms of depression; glycemic control in patients with diabetes; or lipid profiles in patients being treated for hyperlipidemias. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding.

Nursing: Physical Assessment/MonitoringSee individual agent for Norethindrone.

Patient EducationSee individual agent for Norethindrone.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, monophasic formulations:

Necon® 1/50: Norethindrone 1 mg and mestranol 0.05 mg [21 light blue tablets and 7 white inactive tablets] (28s)

Norinyl® 1+50: Norethindrone 1 mg and mestranol 0.05 mg [21 white tablets and 7 orange inactive tablets] (28s)

Ortho-Novum® 1/50: Norethindrone 1 mg and mestranol 0.05 mg [21 yellow tablets and 7 green inactive tablets] (28s) [DSC]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Necon 1/50 (28))

1-50 mg-mcg (84): $75.00

Mechanism of ActionCombination oral contraceptives inhibit ovulation via a negative feedback mechanism on the hypothalamus, which alters the normal pattern of gonadotropin secretion of a follicle-stimulating hormone (FSH) and luteinizing hormone by the anterior pituitary. The follicular phase FSH and midcycle surge of gonadotropins are inhibited. In addition, combination hormonal contraceptives produce alterations in the genital tract, including changes in the cervical mucus, rendering it unfavorable for sperm penetration even if ovulation occurs. Changes in the endometrium may also occur, producing an unfavorable environment for nidation. Combination hormonal contraceptive drugs may alter the tubal transport of the ova through the fallopian tubes. Progestational agents may also alter sperm fertility.

Pharmacodynamics/Kinetics

Mestranol: Metabolism: Hepatic via demethylation to ethinyl estradiol

Norethindrone: See Norethindrone monograph for additional information.

Pharmacotherapy PearlsThe World Health Organization (WHO) has issued revised management recommendations for missed combined oral contraceptive pills. Refer to the following reference for a complete presentation and discussion of the guidelines:

Faculty of Family Planning and Reproductive Health Care Clinical Effectiveness Unit, "Faculty Statement from the CEU on a New Publication: WHO Selected Practice Recommendations for Contraceptive Use Update. Missed Pills: New Recommendations," *J Fam Plann Reprod Health Care*, 2005, 31(2):153-5.

Dental Health: Effects on Dental TreatmentWhen prescribing antibiotics, patient must be advised to use additional methods of birth control if on hormonal contraceptives.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause anxiety or depression

Mental Health: Effects on Psychiatric TreatmentHepatic metabolism of TCAs, benzodiazepines (oxidatively metabolized) and beta-blockers may be decreased by oral contraceptives; monitor increased/toxic effects; may increase the clearance of benzodiazepines (glucuronidation); barbiturates may increase the metabolism of oral contraceptives resulting in decreased effectiveness

Cardiovascular ConsiderationsIt is important to recognize that oral contraceptives may induce or worsen hypertension. These problems are less severe with low-dose oral contraceptives. Furthermore, oral contraceptives may precipitate thromboembolic events, particularly in women who smoke. It is important that patients on long-term oral contraceptives undergo monitoring of blood pressure and avoid cigarette use.

Index TermsMestranol and Norethindrone; Ortho Novum 1/50

Canadian Brand NamesMicronor®; Norlutate®

Pharmacologic CategoryContraceptive; Progestin

Use: Labeled IndicationsTreatment of amenorrhea; abnormal uterine bleeding; endometriosis; prevention of pregnancy

Dosing: Adults

Contraception (females): Oral: Progesterone only: Norethindrone 0.35 mg every day (no missed days)

Initial dose: Start on first day of menstrual period or the day after a miscarriage or abortion. If switching from a combined oral contraceptive, begin the day after finishing the last active combined tablet.

Missed dose: Take as soon as remembered. A back up method of contraception should be used for 48 hours if dose is taken ≥3 hours late.

Amenorrhea and abnormal uterine bleeding: Oral: Norethindrone acetate: 2.5-10 mg/day for 5-10 days during the second half of the menstrual cycle

Endometriosis: Oral: Norethindrone acetate: 5 mg/day for 14 days; increase at increments of 2.5 mg/day every 2 weeks to reach 15 mg/day; continue for 6-9 months or until breakthrough bleeding demands temporary termination

Dosing: PediatricAdolescents: Refer to adult dosing

Administration: Oral

Administer at the same time each day. When used for the prevention of pregnancy, a back up method of contraception should be used for 48 hours if dose is missed or taken ≥3 hours late.

Dietary ConsiderationsShould be taken at same time each day.

StorageStore at controlled room temperature of 25°C (77°F).

ContraindicationsHypersensitivity to norethindrone or any component of the formulation; history of or current thrombophlebitis or venous thromboembolic disorders (including DVT, PE); hepatic dysfunction or tumor; known or suspected breast carcinoma; undiagnosed vaginal bleeding; pregnancy; missed abortion or as a diagnostic test for pregnancy

Warnings/Precautions

Concerns related to adverse effects:

- Bleeding: Irregular menstrual bleeding patterns are common with progestin only contraceptives; nonpharmacologic causes of abnormal bleeding should be ruled out.
- Breast cancer: The use of combination hormonal contraceptives has been associated with a slight increase in the frequency of breast cancer, however studies are not consistent. Data is insufficient to determine if progestin only contraceptives also increase this risk.
- Carbohydrate intolerance: May have adverse effects on glucose tolerance; use caution in women with diabetes.
- Lipid effects: May have adverse effects on lipid metabolism; use caution in women with hyperlipidemias.
- Retinal vascular lesions: Progestin use has been associated with retinal vascular lesions; discontinue pending examination in case of sudden vision loss, complete loss of vision, sudden onset of proptosis, diplopia, or migraine.
- Thromboembolism: Use caution in patients at increased risk of thromboembolism; includes elective surgery associated with an increased risk of thromboembolism or during periods of prolonged immobilization.

Disease-related concerns:

- Depression: Use with caution in patients with depression.
- Diseases exacerbated by fluid retention: Use with caution in patients with diseases which may be exacerbated by fluid retention, including asthma, epilepsy, migraine, cardiac or renal dysfunction.
- Hepatic adenomas: Extremely rare hepatic adenomas and focal nodular hyperplasia resulting in fatal intra-abdominal hemorrhage have been reported in association with long-term combination oral contraceptive use. Data is insufficient to determine if progestin-only contraceptives also increase this risk.
- Migraine: Use with caution in patients with a history of migraine.

Special populations:

- Pediatrics: Not for use prior to menarche.
- Smokers: The risk of cardiovascular side effects increases in women using estrogen containing combined hormonal contraceptives and who smoke cigarettes, especially those who are >35 years of age. This risk relative to progestin-only contraceptives has not been established.

Other warnings/precautions:

- HIV infection protection: Progestin-only contraceptives do not protect against HIV infection or other sexually-transmitted diseases.

Pregnancy Risk FactorX
Pregnancy ConsiderationsFirst trimester exposure may cause genital abnormalities including hypospadias in male infants and mild virilization of external female genitalia. Significant adverse events related to growth and development have not been observed (limited studies). Use is contraindicated during pregnancy. May be started immediately postpartum if not breast-feeding.
LactationEnters breast milk/use caution
Breast-Feeding ConsiderationsSmall amounts of progestins are found in breast milk (1% to 6% of maternal serum concentration). Norethindrone can cause changes in milk production in the mother. When used for contraception, may start 3 weeks after delivery in women who are partially breast-feeding, or 6 weeks after delivery in women who are fully breast-feeding.
Adverse ReactionsFrequency not defined.

Cardiovascular: Cerebral embolism, cerebral thrombosis, DVT, edema

Central nervous system: Depression, dizziness, headache, insomnia, migraine, mood swings

Dermatologic: Acne, chloasma, hirsutism, melasma, pruritus, rash, urticaria

Endocrine & metabolic: Amenorrhea, breakthrough bleeding, breast enlargement/tenderness, menstrual flow changes, spotting

Gastrointestinal: Nausea, weight gain/loss

Genitourinary: Cervical erosion changes, cervical secretion changes

Hepatic: Cholestatic jaundice, liver function test abnormalities

Ocular: Optic neuritis (with or without vision loss), retinal vascular thrombosis

Respiratory: Pulmonary embolism

Miscellaneous: Anaphylactic/anaphylactoid reactions

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Induces** CYP2C19 (weak)
Drug Interactions

Acitretin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Aminoglutethimide: May increase the metabolism of Progestins. *Risk D: Consider therapy modification*

Aprepitant: May decrease the serum concentration of Contraceptive (Progestins). *Risk D: Consider therapy modification*

Barbiturates: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Oral Contraceptive (Progestins) may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

CarBAMazepine: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Colesevelam: May decrease the serum concentration of Norethindrone. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Darunavir: May decrease the serum concentration of Norethindrone. *Risk D: Consider therapy modification*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Felbamate: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Fosaprepitant: May decrease the serum concentration of Contraceptive (Progestins). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Griseofulvin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Herbs (Progestogenic Properties) (eg, Bloodroot, Yucca): May enhance the adverse/toxic effect of Progestins. *Risk C: Monitor therapy*

Mycophenolate: May decrease the serum concentration of Oral Contraceptive (Progestins). *Risk D: Consider therapy modification*

OXcarbazepine: May decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Phenytoin: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Retinoic Acid Derivatives: May diminish the therapeutic effect of Oral Contraceptive (Progestins). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. **Exceptions:** Adapalene; Alitretinoin; Tretinoin (Topical). *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Rufinamide: May decrease the serum concentration of Norethindrone. *Risk D: Consider therapy modification*

Selegiline: Oral Contraceptive (Progestins) may increase the serum concentration of Selegiline. *Risk D: Consider therapy modification*

St Johns Wort: May diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Contraceptive (Progestins) may diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Voriconazole: May decrease the metabolism of Oral Contraceptive (Progestins). Oral Contraceptive (Progestins) may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid bloodroot, chasteberry, damiana, oregano, and yucca; may enhance the adverse/toxic effect of progestins. Avoid St John's wort; may diminish the therapeutic effect of progestin contraceptives; contraceptive failure is possible.

Test InteractionsMay increase prothrombin, factors VII, VIII, IX and X, PBI, and BEI. May decrease T_3 uptake; may decrease sex hormone-binding globulin (SHBG); may have a reduced response to metyrapone test.

Monitoring ParametersContraception: Before starting therapy, a physical exam with reference to the breasts and pelvis are recommended, including a Papanicolaou smear. Exam may be deferred if appropriate; pregnancy should be ruled out prior to use. Monitor patient closely for loss of vision, sudden onset of proptosis, diplopia, migraine; blood pressure; signs and symptoms of thromboembolic disorders; signs or symptoms of depression; glycemic control in patients with diabetes; lipid profiles in patients being treated for hyperlipidemias. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding.

Nursing: Physical Assessment/MonitoringAssess patient knowledge/teach appropriate administration schedule and adverse signs to report. Physical exam with reference to the breasts and pelvis, including a Papanicolaou smear. Exam may be deferred if appropriate; pregnancy should be ruled out prior to use. Monitor patient closely for loss of vision, sudden onset of proptosis, diplopia, migraine; blood pressure; signs and symptoms of thromboembolic disorders; signs or symptoms of depression; glycemic control in diabetics; lipid profiles in patients being treated for hyperlipidemias. Adequate diagnostic measures, including endometrial sampling, if indicated, should be performed to rule out malignancy in all cases of undiagnosed abnormal vaginal bleeding. Teach appropriate breast self-exam and the need for regular breast self-exam and necessity of annual physical check-up with long-term use. **Pregnancy risk factor X:** Determine that patient is not pregnant before beginning treatment.

Patient EducationTake according to prescribed schedule. Follow instructions for regular self-breast exam. You may experience dizziness or lightheadedness; use caution when driving or engaging in tasks that require alertness until response to drug is known. Limit intake of caffeine. Avoid high-dose vitamin C. If you have diabetes, monitor blood glucose closely. You may experience photosensitivity; use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight. You may experience loss of hair (reversible), swelling of hands or feet, weight gain or loss. Report sudden severe headache or vomiting, disturbances of vision or speech, sudden blindness, numbness of weakness in an extremity, chest pain, calf pain, respiratory difficulty, weight gain >5 lb/week, depression or acute fatigue, unusual bleeding, spotting, or changes in menstrual flow. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.

5 mg (30): $56.99

Tablets (Ortho Micronor)

0.35 mg (28): $48.36

Mechanism of ActionInhibits secretion of pituitary gonadotropin (LH) which prevents follicular maturation and ovulation

Pharmacodynamics/Kinetics

Absorption: Oral: Rapidly absorbed

Distribution: V_d: 4 L/kg

Protein binding: 61% to albumin; 36% to sex hormone-binding globulin (SHBG); SHBG capacity affected by plasma ethinyl estradiol levels

Metabolism: Oral: Hepatic via reduction and conjugation; first-pass effect

Bioavailability: 64%

Half-life elimination: ~8 hours

Time to peak: 1-2 hours

Excretion: Urine (>50% as metabolites); feces (20% to 40% as metabolites)

Dental Health: Effects on Dental TreatmentUntil we know more about the mechanism of interaction, caution is required in prescribing antibiotics to female dental patients taking progestin-only hormonal contraceptives.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause insomnia or depression

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsNorethindrone Acetate; Norethisterone

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Norfloxacin may be confused with Norflex™, Noroxin®

Noroxin® may be confused with Neurontin®, Norflex™, norfloxacin

Pronunciation(nor FLOKS a sin)

U.S. Brand NamesNoroxin®

Canadian Brand NamesApo-Norflox®; CO Norfloxacin; Norfloxacine®; Noroxin® ; Novo-Norfloxacin; PMS-Norfloxacin; Riva-Norfloxacin

Pharmacologic Category[Antibiotic, Quinolone]()

Use: Labeled IndicationsUncomplicated and complicated urinary tract infections caused by susceptible gram-negative and gram-positive bacteria; sexually-transmitted disease (eg, uncomplicated urethral and cervical gonorrhea) caused by *N. gonorrhoeae*; prostatitis due to *E. coli*

Note: As of April 2007, the CDC no longer recommends the use of fluoroquinolones for the treatment of gonococcal disease.

Dosing: Adults

Dysenteric enterocolitis(*Shigella*unlabeled use): Oral: 400 mg twice daily for 5 days

Prostatitis: Oral: 400 mg every 12 hours for 4-6 weeks

Traveler's diarrhea (unlabeled use): Oral: 400 mg twice daily for 3 days, single dose may also be effective

Uncomplicated gonorrhea: Oral: 800 mg as a single dose. **Note:** As of April 2007, the CDC no longer recommends the use of fluoroquinolones for the treatment of uncomplicated gonococcal disease.

Urinary tract infections: Oral:

Uncomplicated due to *E. coli, K. pneumoniae, P. mirabilis*: 400 mg twice daily for 3 days

Uncomplicated due to other organisms: 400 mg twice daily for 7-10 days

Complicated: 400 mg twice daily for 10-21 days

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment Cl_{cr} ≤30 mL/minute/1.73 m^2: Administer 400 mg every 24 hours

Calculations

- [Creatinine Clearance: Adults]()

Administration: OralHold antacids, sucralfate, or multivitamins/supplements containing iron, zinc, magnesium, or aluminum for 2 hours after giving norfloxacin; do not administer together. Best taken on an empty stomach with water (1 hour before or 2 hours after meals, milk, or other dairy products).

Dietary ConsiderationsOral formulations should be administered on an empty stomach with water (1 hour before or 2 hours after meals, milk, or other dairy products). Maintain fluid intake to ensure adequate hydration and urinary output.

StorageStore at 25°C (77°F). Keep container tightly closed.

RestrictionsAn FDA-approved patient medication guide is available and must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to norfloxacin, quinolones, or any component of the formulation; history of tendonitis or tendon rupture associated with quinolone use

Allergy Considerations

- [Fluoroquinolone Allergy]()

Warnings/Precautions

Boxed Warnings:

- Tendon inflammation/rupture: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Altered cardiac conduction: Fluoroquinolones may prolong QT_c interval; avoid use in patients with a history of QT_c prolongation, uncorrected hypokalemia, hypomagnesemia, or concurrent administration of other medications known to prolong the QT interval (including Class Ia and Class III antiarrhythmics, cisapride, erythromycin, antipsychotics, and tricyclic antidepressants).

- CNS stimulation: Tremor, restlessness, confusion, and very rarely hallucinations or seizures may occur; use with caution in patients with known or suspected CNS disorder. Discontinue in patients who experience significant CNS adverse effects (eg, dizziness, hallucinations, suicidal ideations or actions).

- Glucose regulation: Fluoroquinolones have been associated with the development of serious, and sometimes fatal, hypoglycemia. These events have occurred most often in elderly patients with diabetes, but have also been reported in patients without a prior history of diabetes. Prompt identification and treatment of hypoglycemia is essential. Individual quinolones may differ in their potential to cause this effect. It was most evident with gatifloxacin (no longer marketed as s systemic formulation). Hyperglycemia has also been associated with the use of fluoroquinolones. Patients should be monitored closely for signs/symptoms of disordered glucose regulation.

- Hypersensitivity reactions: Severe hypersensitivity reactions, including anaphylaxis, have occurred with quinolone therapy. The spectrum of these reactions can vary widely; reactions may present as typical allergic symptoms (eg, itching, urticaria, rash, edema) after a single dose, or may manifest as severe idiosyncratic dermatologic (eg, Stevens-Johnson, toxic epidermal necrolysis), vascular (eg, vasculitis), pulmonary (eg, pneumonitis), renal (eg, nephritis), hepatic (eg, hepatic failure or necrosis), and/or hematologic (eg, anemia, cytopenias) events, usually after multiple doses. Prompt discontinuation of drug should occur if skin rash or other symptoms arise.

- Peripheral neuropathy: The use of quinolones has been linked to peripheral neuropathy (rare); discontinue if symptoms of sensory or sensorimotor neuropathy occur.

- Phototoxicity: Avoid excessive sunlight and take precautions to limit exposure (eg, loose fitting clothing, sunscreen); may cause moderate-to-severe phototoxicity reactions. Discontinue use if photosensitivity occurs.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

- Tendon inflammation/rupture: **[U.S. Boxed Warning]: There have been reports of tendon inflammation and/or rupture with quinolone antibiotics; risk may be increased with concurrent corticosteroids, organ transplant recipients, and in patients >60 years of age.** Rupture of the Achilles tendon sometimes requiring surgical repair has been reported most frequently; but other tendon sites (eg, rotator cuff, biceps) have also been reported. Strenuous physical activity may be an independent risk factor for tendonitis. Discontinue at first sign of tendon inflammation or pain. May occur even after discontinuation of therapy.

Disease-related concerns:

- Myasthenia gravis: Some quinolones may exacerbate myasthenia gravis, use with caution (rare, potentially life-threatening weakness of respiratory muscles may occur).

- Renal impairment: Use caution with renal impairment; dose adjustment required. May increase risk of tendon rupture.

- Rheumatoid arthritis: Use with caution in patients with rheumatoid arthritis; may increase risk of tendon rupture.

- Seizures: Use with caution in individuals at risk of seizures (CNS disorders or concurrent therapy with medications which may lower seizure threshold). Potential for seizures, although very rare, may be increased with concomitant NSAID therapy.

- Syphilis: Since norfloxacin is ineffective in the treatment of syphilis and may mask symptoms, all patients should be tested for syphilis at the time of gonorrheal diagnosis and 3 months later.

Special populations:

- Elderly: Adverse effects (eg, tendon rupture, QT changes) may be increased in the elderly.

- G6PD deficiency: Hemolytic reactions may (rarely) occur with quinolone use in patients with latent or actual G6PD deficiency.

- Pediatrics: Safety and efficacy have not been established in children; other quinolones have caused transient arthropathy in children.

Geriatric ConsiderationsSee Warnings/Precautions regarding tendon rupture in patients >60 years of age. Adjust dose for renal function.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse events have been observed in some animal studies; therefore, the manufacturer classifies norfloxacin as pregnancy category C. Norfloxacin crosses the placenta, distributing to cord blood and amniotic fluid. An increased risk of teratogenic effects has not been observed in animals or humans following norfloxacin use during pregnancy; however, because of concerns of cartilage damage in immature animals, norfloxacin should only be used during pregnancy if a safer option is not available.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsNorfloxacin was not detected in the milk of nursing mothers administered an oral 200 mg dose. It is not known if concentrations would be detectable after a higher dose or multiple doses. Breast-feeding is not recommended by the manufacturer.

Pregnancy & Lactation, In-Depth

- Norfloxacin in Pregnancy & Lactation

Adverse Reactions

>1% to 10%:

Central nervous system: Headache (2% to 3%), dizziness (2% to 3%)

Gastrointestinal: Nausea (3%to 4%), abdominal cramping (2%)

Hematologic: Eosinophilia (1% to 2%)

Hepatic: Liver enzymes increased (1% to 2%)

≥0.3% to 1%:

Central nervous system: Fever, somnolence

Dermatologic: Hyperhidrosis, pruritus, rash

Gastrointestinal: Abdominal pain, anorectal pain, anorexia, constipation, diarrhea, dyspepsia, flatulence, loose stools, vomiting, xerostomia

Hematologic: Hematocrit/hemoglobin decreased (1%), leukopenia (1%), thrombocytopenia (1%)

Neuromuscular & skeletal: Back pain, paresthesia, weakness

Renal: Proteinuria (1%)

<0.3%, postmarketing, and/or case reports: Abdominal swelling, acute renal failure, agranulocytosis, albuminuria, alkaline phosphatase increased, allergy, anaphylactoid reactions, anaphylaxis, angioedema, anxiety, arthralgia, arthritis, ataxia, bitter taste, blurred vision, bursitis, candiduria, chest pain, chills, cholestatic jaundice, cholesterol increased, confusion, CPK increased, crystalluria, cylinduria, depression, diplopia, dysgeusia, dysmenorrhea, dyspnea, edema, erythema, erythema multiforme, exacerbation of myasthenia gravis, exfoliative dermatitis, GI bleeding, glycosuria, Guillain-Barré syndrome, hearing loss, heartburn, hematuria, hemolytic anemia (sometimes associated with G6PD deficiency), hepatic failure, hepatic necrosis, hepatitis, hyper-/hypoglycemia, hyperkalemia, hypersensitivity, hypoesthesia, insomnia, interstitial nephritis, jaundice, LDH increased, MI, mouth ulcer, myalgia, myoclonus, neutropenia, nystagmus, palpitation, pancreatitis (rare), peripheral edema, peripheral neuropathy, photosensitivity/toxicity, postural hypotension, prothrombin time increased, pruritus ani, pseudomembraneous colitis, psychotic reactions, QT_c prolongation, renal colic, seizure, serum creatinine/BUN increased, Stevens-Johnson syndrome, stomatitis, tendon rupture, tendonitis, tingling of fingers, tinnitus, torsade de pointes, toxic epidermal necrolysis, tremor, triglyceridemia, urticaria, vaginal candidiasis , vasculitis, ventricular arrhythmia

Metabolism/Transport Effects **Inhibits** CYP1A2 (strong), 3A4 (moderate)

Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. **Exceptions:** Sodium Bicarbonate. *Risk D: Consider therapy modification*

Bendamustine: CYP1A2 Inhibitors (Strong) may increase the serum concentration of Bendamustine. Concentrations of the active metabolites of bendamustine may be decreased. *Risk C: Monitor therapy*

Caffeine: Quinolone Antibiotics may decrease the metabolism of Caffeine. *Risk C: Monitor therapy*

Calcium Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. **Exceptions:** Calcium Chloride. *Risk D: Consider therapy modification*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Corticosteroids (Systemic): Quinolone Antibiotics may enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

CycloSPORINE: Norfloxacin may decrease the metabolism of CycloSPORINE. *Risk C: Monitor therapy*

CYP1A2 Substrates: CYP1A2 Inhibitors (Strong) may decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Didanosine: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents (excludes enteric coated formulation of didanosine). *Risk D: Consider therapy modification*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Insulin: May enhance the hyperglycemic effect of Quinolone Antibiotics. Insulin may enhance the hypoglycemic effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Iron Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Magnesium Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Mycophenolate: Quinolone Antibiotics may decrease the serum concentration of Mycophenolate. Specifically, quinolones may decrease concentrations of the active metabolite of mycophenolate. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Nitrofurantoin: May diminish the therapeutic effect of Norfloxacin. *Risk X: Avoid combination*

Nonsteroidal Anti-Inflammatory Agents: May enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Probenecid: May increase the serum concentration of Quinolone Antibiotics. *Risk C: Monitor therapy*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Quinapril: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Sevelamer: May decrease the absorption of Quinolone Antibiotics. *Risk D: Consider therapy modification*

Sucralfate: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

Sulfonylureas: Quinolone Antibiotics may enhance the hypoglycemic effect of Sulfonylureas. This appears to be particularly concerning early in the course of combination therapy. Quinolone Antibiotics may diminish the hypoglycemic effect of Sulfonylureas. With longer-term combination, there is a greater risk of hyperglycemia. *Risk C: Monitor therapy*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Theophylline Derivatives: Quinolone Antibiotics may decrease the metabolism of Theophylline Derivatives. Ciprofloxacin and enoxacin are of greatest concern. Theophylline/quinolone therapy might augment the seizure-producing potential of each of the individual agents. **Exceptions:** Dyphylline. *Risk D: Consider therapy modification*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Quinolone Antibiotics may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Zinc Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Food: Norfloxacin average peak serum concentrations may be decreased if taken with dairy products. Use caution with caffeine-containing beverages/foods; quinolones may increase blood levels of caffeine.

Herb/Nutraceutical: Avoid dong quai, St John's wort (may also cause photosensitization); avoid administration within 2 hours of multivitamins or other supplements containing iron, zinc, magnesium, or aluminum.

Nursing: Physical Assessment/MonitoringAssess allergy history before initiating therapy. See Contraindications and Warnings/Precautions for use cautions. Assess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking (see extensive list of Drug Interactions). Assess results of laboratory tests (see Monitoring Laboratory Tests), therapeutic effectiveness, and adverse effects (see Adverse Reactions and Overdose/Toxicology). Teach patient appropriate use (according to formulation), possible side effects/appropriate interventions, and adverse symptoms to report (see Patient Education). **Pregnancy risk factor C** - benefits of use should outweigh possible risks. Breast-feeding is contraindicated.

Monitoring: Lab TestsPerform culture and sensitivity prior to beginning therapy. Monitor CBC, renal and hepatic function periodically if therapy is prolonged.

Patient EducationInform prescriber of all prescriptions, OTC medications, or herbal products you are taking, and any allergies you have. Do not take any new medication during therapy unless approved by prescriber. Take as directed for as long as directed, preferably on an empty stomach, 1 hour before or 2 hours after meals. Do not alter dose or discontinue without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience dizziness, lightheadedness, or headache (use caution when driving or engaging in tasks that require alertness until response to drug is known); nausea, vomiting, anorexia, or dry mouth (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); diarrhea (buttermilk, boiled milk, or yogurt may help); or photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight). If inflammation or tendon pain occurs discontinue use immediately and report to prescriber. If allergic reaction occurs (itching urticaria, respiratory difficulty, facial edema, difficulty swallowing, loss of consciousness, tingling, chest pain, palpitations), discontinue use immediately and report to prescriber. Contact prescriber if you experience pain in your extremities, burning, tingling, numbness, and/or weakness. Report palpitations or chest pain; persistent diarrhea or constipation; signs of infection (unusual fever or chills; vaginal itching or foul-smelling vaginal discharge; easy bruising or bleeding); excessive sleepiness; or agitation. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Noroxin®: 400 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (Noroxin)

400 mg (20): $79.99

400 mg (30): $117.98

Mechanism of ActionNorfloxacin is a DNA gyrase inhibitor. DNA gyrase is an essential bacterial enzyme that maintains the superhelical structure of DNA. DNA gyrase is required for DNA replication and transcription, DNA repair, recombination, and transposition; bactericidal

Pharmacodynamics/Kinetics

Absorption: Oral: Rapid, up to 40%

Protein binding: 10% to 15%

Metabolism: Hepatic

Half-life elimination: 3-4 hours; Renal impairment (Cl_{cr} ≤30 mL/minute): 6.5 hours; Elderly: 4 hours

Time to peak, serum: 1-2 hours

Excretion: Urine (26% to 32% as unchanged drug; 5% to 8% as metabolites); feces (39%)

Related Information

- Treatment of Sexually-Transmitted Infections

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNorfloxacin is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, mepivacaine and levonordefrin [Carbocaine® 2% with Neo-Cobefrin®]) be used with caution.

Mental Health: Effects on Mental StatusMay cause dizziness, drowsiness, or insomnia; quinolones reported to cause restlessness, hallucinations, euphoria, depression, panic, and paranoia

Mental Health: Effects on Psychiatric TreatmentInhibits CYP1A2 isoenzyme; use caution with clozapine and other psychotropics; monitor for adverse effects

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Aventyl® HCl may be confused with Bentyl®

Nortriptyline may be confused with amitriptyline, desipramine, Norpramin®

Pamelor® may be confused with Demerol®, Dymelor®, Panlor® DC

Pronunciation(nor TRIP ti leen)

U.S. Brand NamesPamelor®

Canadian Brand NamesAlti-Nortriptyline; Apo-Nortriptyline®; Aventyl®; Gen-Nortriptyline; Norventyl; Novo-Nortriptyline; Nu-Nortriptyline; PMS-Nortriptyline

Pharmacologic CategoryAntidepressant, Tricyclic (Secondary Amine)

Use: Labeled IndicationsTreatment of symptoms of depression

Use: Unlabeled/InvestigationalChronic pain, anxiety disorders, enuresis, attention-deficit/hyperactivity disorder (ADHD); adjunctive therapy for smoking cessation

Use: DentalTreatment of myofascial pain, neuralgia, burning mouth syndrome

Dosing: Adults

Depression: Oral: 25 mg 3-4 times/day up to 150 mg/day; doses may be given once daily.

Chronic urticaria, angioedema, nocturnal pruritus (unlabeled use): Oral: 75 mg/day

Myofascial pain, neuralgia, burning mouth syndrome (dental use): Initial: 10-25 mg at bedtime; dosage may be increased by 25 mg/day weekly, if tolerated; usual maintenance dose: 75 mg as a single bedtime dose or 2 divided doses

Smoking cessation (unlabeled use): Oral: 25-75 mg/day beginning 10-14 days before "quit" day; continue therapy for ≥12 weeks after "quit" day

Dosing: ElderlyInitial: 30-50 mg/day, given as a single daily dose or in divided doses. **Note:** Nortriptyline is one of the best tolerated TCAs in the elderly)

Dosing: Pediatric

Nocturnal enuresis (unlabeled use): Oral: 10-20 mg/day; titrate to a maximum of 40 mg/day

Depression (unlabeled use): Oral: 1-3 mg/kg/day

Dosing: Hepatic ImpairmentLower doses and slower titration are recommended dependent on individualization of dosage.

StorageStore at 20°C to 25°C (68°F to 77°F). Protect from light.

RestrictionsAn FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.

ContraindicationsHypersensitivity to nortriptyline and similar chemical class, or any component of the formulation; use of MAO inhibitors within 14 days; use in a patient during the acute recovery phase of MI

Allergy Considerations

- Tricyclic Antidepressant and Related Compounds Allergy

Warnings/Precautions

Boxed warnings:

- Suicidal thinking/behavior: See "Major psychiatric warnings" below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor patients for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 months of therapy or during periods of dosage adjustments (increases or decreases); the patient's family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants should be dispensed with each prescription. **Nortriptyline is not FDA approved for use in children.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **Nortriptyline is not FDA approved for the treatment of bipolar depression.**

Concerns related to adverse effects:

- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems. The degree of anticholinergic blockade produced by this agent is moderate relative to other antidepressants.

- Hematologic effects: TCAs may rarely cause bone marrow suppression; monitor for any signs of infection and obtain CBC if symptoms (eg, fever, sore throat) evident.

- Orthostatic hypotension: May cause orthostatic hypotension (risk is low relative to other antidepressants); use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Sedation: May cause sedation, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving). The degree of sedation is low-moderate relative to other antidepressants.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with a history of cardiovascular disease (including previous MI, stroke, tachycardia, or conduction abnormalities); the risk of conduction abnormalities with this agent is moderate relative to other antidepressants.

- Diabetes: Use with caution in patients with diabetes mellitus; may alter glucose regulation.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Renal impairment: Use with caution in patients with renal impairment.

- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

- Thyroid dysfunction: Use with caution in patients with hyperthyroidism or those receiving thyroid supplementation due to concerns of pro-arrhythmogenesis.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly.

Other warnings/precautions:

- Discontinuation of therapy: Recommended to discontinue prior to elective surgery requiring general anesthesia. Therapy should not be abruptly discontinued in patients receiving high doses for prolonged periods.

- Electroconvulsive therapy: May increase the risks associated with electroconvulsive therapy; consider discontinuing, when possible, prior to ECT treatment.

Geriatric ConsiderationsSince nortriptyline is the least likely of the tricyclic antidepressants (TCAs) to cause orthostatic hypotension and one of the least anticholinergic and sedating TCAs, it is a preferred agent when a TCA is indicated. Data from a clinical trial comparing fluoxetine to tricyclics suggests that fluoxetine is significantly less effective than nortriptyline in hospitalized elderly patients with unipolar affective disorder, especially those with melancholia and concurrent cardiovascular disease. Paroxetine has been shown to be an equally effective antidepressant compared to nortriptyline in patients with ischemic heart disease. However, nortriptyline was associated a significantly higher rate of adverse cardiac events (sustained increase in heart rate, sinus tachycardia, and asymptomatic increase in ventricular ectopy) compared to placebo.

LactationEnters breast milk/contraindicated (AAP rates “of concern”)

Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmia, flushing, heart block, hypertension, MI, palpitation, postural hypotension, tachycardia

Central nervous system: Agitation, anxiety, ataxia, confusion, delirium, delusions, disorientation, dizziness, drowsiness, EEG changes, exacerbation of psychosis, extrapyramidal symptoms, fatigue, hallucinations, headache, hypomania, incoordination, insomnia, nightmares, panic, restlessness, seizure

Dermatologic: Alopecia, itching, petechiae, photosensitivity, rash, urticaria

Endocrine & metabolic: Blood sugar increases/decreases, breast enlargement, galactorrhea, gynecomastia, increase or decrease in libido, sexual dysfunction, SIADH

Gastrointestinal: Abdominal cramps, anorexia, black tongue, constipation, diarrhea, epigastric distress, nausea, paralytic ileus, stomatitis, taste disturbance, vomiting, weight gain/loss, xerostomia

Genitourinary: Delayed micturition, impotence, nocturia, polyuria, testicular edema, urinary retention

Hematologic: Agranulocytosis (rare), eosinophilia, purpura, thrombocytopenia

Hepatic: Cholestatic jaundice, transaminases increased

Neuromuscular & skeletal: Numbness, paresthesia, peripheral neuropathy, tingling, tremor, weakness

Ocular: Blurred vision, disturbances in accommodation, eye pain, mydriasis

Otic: Tinnitus

Miscellaneous: Allergic reactions (eg, general edema or of the face/tongue), diaphoresis (excessive), withdrawal symptoms

Metabolism/Transport Effects**Substrate** of CYP1A2 (minor), 2C19 (minor), 2D6 (major), 3A4 (minor); **Inhibits** CYP2D6 (weak), 2E1 (weak)
Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Tricyclic Antidepressants may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Agonists: Tricyclic Antidepressants may enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Alpha2-Agonists: Tricyclic Antidepressants may diminish the antihypertensive effect of Alpha2-Agonists. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Altretamine: May enhance the orthostatic effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Amphetamines: Tricyclic Antidepressants may enhance the stimulatory effect of Amphetamines. Tricyclic Antidepressants may also potentiate the cardiovascular effects of Amphetamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Beta2-Agonists: Tricyclic Antidepressants may enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

BuPROPion: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Cinacalcet: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Desmopressin: Tricyclic Antidepressants may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Dexmethylphenidate: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

DULoxetine: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Iobenguane I 123: Tricyclic Antidepressants may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Lithium: May enhance the neurotoxic effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the serotonergic effect of Tricyclic Antidepressants. This may cause serotonin syndrome. *Risk X: Avoid combination*

Methylphenidate: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Propoxyphene: May enhance the CNS depressant effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Protease Inhibitors: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

QuiNIDine: Tricyclic Antidepressants may enhance the QTc-prolonging effect of QuiNIDine. QuiNIDine may decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

St Johns Wort: May increase the metabolism of Tricyclic Antidepressants. The risk of serotonin syndrome may theoretically be increased. *Risk D: Consider therapy modification*

Sulfonylureas: Cyclic Antidepressants may enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Terbinafine: May decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

TraMADol: Tricyclic Antidepressants may enhance the neuroexcitatory and/or seizure-potentiating effect of TraMADol. *Risk C: Monitor therapy*

Valproic Acid: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Tricyclic Antidepressants may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Yohimbine: Tricyclic Antidepressants may increase the serum concentration of Yohimbine. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, SAMe, kava kava (may increase risk of serotonin syndrome and/or excessive sedation).

Monitoring ParametersBlood pressure and pulse rate (ECG, cardiac monitoring) prior to and during initial therapy in older adults; weight; blood levels are useful for therapeutic monitoring; suicidal ideation (especially at the beginning of therapy or when doses are increased or decreased)

Reference Range

Plasma levels do not always correlate with clinical effectiveness

Therapeutic: 50-150 ng/mL (SI: 190-570 nmol/L)

Toxic: >500 ng/mL (SI: >1900 nmol/L)

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess for suicidal tendencies before beginning therapy. May cause physiological or psychological dependence, tolerance, or abuse; periodically evaluate need for continued use. Assess therapeutic effectiveness (mental status, mood, affect) and adverse reactions (eg, suicidal ideation) at beginning of therapy and periodically with long-term use. Taper dosage slowly when discontinuing (allow 3-4 weeks between discontinuing this medication and starting another antidepressant). Caution patients with diabetes to monitor glucose levels closely; may increase or decrease serum glucose levels. Teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed; take once-a-day dose at bedtime. Do not increase dose or frequency; may take 2-3 weeks to achieve desired results. This drug may cause physical and/or psychological dependence. Avoid alcohol and grapefruit juice. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause drowsiness, lightheadedness, impaired coordination, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, loss of appetite, or disturbed taste (small frequent meals, good mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); urinary retention (void before taking medication); postural hypotension (use caution climbing stairs or when changing position from lying or sitting to standing); altered sexual drive or ability (reversible); or photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight). Report chest pain, palpitations, or rapid heartbeat; persistent adverse CNS effects (eg, suicidal ideation, nervousness, restlessness, insomnia, anxiety, excitation, headache, agitation, impaired coordination, changes in cognition); muscle cramping, weakness, tremors, or rigidity; blurred vision or eye pain; breast enlargement or swelling; yellowing of skin or eyes; or worsening of condition.
Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 10 mg, 25 mg, 50 mg, 75 mg

Pamelor®: 10 mg, 25 mg, 50 mg, 75 mg [may contain benzyl alcohol; 50 mg may also contain sodium bisulfite]

Solution:

Pamelor®: 10 mg/5 mL (473 mL) [contains ethanol 4% and benzoic acid]

Generic AvailableYes: Excludes solution

Pricing: U.S. (www.drugstore.com)

Capsules (Nortriptyline HCl)

25 mg (30): $12.99

50 mg (30): $12.99

75 mg (30): $12.99

Capsules (Pamelor)

10 mg (30): $627.85

25 mg (30): $627.85

50 mg (30): $616.34

75 mg (30): $540.38

Solution (Nortriptyline HCl)

10 mg/5 mL (473): $52.98

Mechanism of ActionTraditionally believed to increase the synaptic concentration of serotonin and/or norepinephrine in the central nervous system by inhibition of their reuptake by the presynaptic neuronal membrane. However, additional receptor effects have been found including desensitization of adenyl cyclase, down regulation of beta-adrenergic receptors, and down regulation of serotonin receptors.

Pharmacodynamics/Kinetics

Onset of action: Therapeutic: 1-3 weeks

Distribution: V_d: 21 L/kg

Protein binding: 93% to 95%

Metabolism: Primarily hepatic; extensive first-pass effect

Half-life elimination: 28-31 hours

Time to peak, serum: 7-8.5 hours

Excretion: Urine (as metabolites and small amounts of unchanged drug); feces (small amounts)

Dental Health Professional ConsiderationsNortriptyline is known to prolong the QT interval. The QT interval is measured as the time and distance between the Q point of the QRS complex and the end of the T wave in the ECG tracing. After adjustment for heart rate, the QT interval is defined as prolonged if it is more than 450 msec in men and 460 msec in women. A long QT syndrome was first described in the 1950s and 60s as a congenital syndrome involving QT interval prolongation and syncope and sudden death. Some of the congenital long QT syndromes were characterized by a peculiar electrocardiographic appearance of the QRS complex involving a premature atria beat followed by a pause, then a subsequent sinus beat showing marked QT prolongation and deformity. This type of cardiac arrhythmia was originally termed “torsade de pointes” (translated from the French as “twisting of the points”).

Prolongation of the QT interval is thought to result from delayed ventricular repolarization. The repolarization process within the myocardial cell is due to the efflux of intracellular potassium. The channels associated with this current can be blocked by many drugs and predispose the electrical propagation cycle to torsade de pointes.

Nortriptyline is considered as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. It is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation), black tongue, and unpleasant taste. Long-term treatment with TCAs, such as nortriptyline, increases the risk of caries by reducing salivation and salivary buffer capacity.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions Nortriptyline is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, mepivacaine and levonordefrin [Carbocaine® 2% with Neo-Cobefrin®]) be used with caution. See Dental Comment.

Mental Health Comment Tricyclic antidepressants may be classified as tertiary (amitriptyline, doxepin, clomipramine, imipramine, trimipramine) or secondary amines (nortriptyline, desipramine, protriptyline). The tertiary amines are not recommended to treat depression in the elderly. If a TCA is used in the elderly, it should be a secondary amine. The tertiary amines are commonly used in low dosages for various conditions associated with pain. Toxicity is generally dose dependent. Relatively small overdoses (1-week supply) can be potentially fatal.

Plasma concentrations correlate with clinical response. A curvilinear relationship exists.

Anesthesia and Critical Care Concerns/Other Considerations Its maximum antidepressant effect may not be seen for ≥2 weeks after initiation of therapy.

Index Terms Nortriptyline Hydrochloride

Nylidrin

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(NYE li drin)

Canadian Brand NamesArlidin®

Pharmacologic CategoryVasodilator, Peripheral

Use: Labeled IndicationsConsidered “possibly effective” for increasing blood supply to treat peripheral disease (arteriosclerosis obliterans, diabetic vascular disease, nocturnal leg cramps, Raynaud's disease, frost bite, ischemic ulcer, thrombophlebitis) and circulatory disturbances of the inner ear (cochlear ischemia, macular or ampullar ischemia, etc)

Dosing: Adults**Circulatory insufficiency:** Oral: 3-12 mg 3-4 times/day

Dosing: ElderlyRefer to adult dosing.

Pregnancy Risk FactorC

Adverse Reactions

1% to 10%:

Central nervous system: Nervousness

Neuromuscular & skeletal: Trembling

<1%: Dizziness, nausea, palpitation, postural hypotension, vomiting, weakness

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Mechanism of ActionNylidrin is a peripheral vasodilator; this results from direct relaxation of vascular smooth muscle and beta-agonist action. Nylidrin does not appear to affect cutaneous blood flow; it reportedly increases heart rate and cardiac output; cutaneous blood flow is not enhanced to any appreciable extent.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause nervousness or dizziness

Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

Sound-alike/look-alike issues:

Mycolog®-II may be confused with Halog®

Pronunciation(nye STAT in & trye am SIN oh lone)

U.S. Brand NamesMycolog®-II [DSC]

Pharmacologic CategoryAntifungal Agent, Topical; Corticosteroid, Topical

Use: Labeled IndicationsTreatment of cutaneous candidiasis

Use: DentalTreatment of angular cheilitis and cutaneous candidiasis

Dosing: Adults**Cutaneous *Candida*:** Topical: Apply sparingly 2-4 times/day

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

Administration: TopicalExternal use only; do not use on open wounds. Apply sparingly to occlusive dressings; should not be used in the presence of open or weeping lesions.

ContraindicationsHypersensitivity to nystatin, triamcinolone, or any component of the formulation

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: Systemic absorption of topical corticosteroids may cause hypothalamic-pituitary-adrenal (HPA) axis suppression (reversible) particularly in younger children. HPA axis suppression may lead to adrenal crisis. Risk is increased when used over large surface areas, for prolonged periods, or with occlusive dressings.
- Contact dermatitis: Allergic contact dermatitis can occur, it is usually diagnosed by failure to heal rather than clinical exacerbation.
- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.
- Systemic effects: Adverse systemic effects including hyperglycemia, glycosuria, fluid and electrolyte changes, and HPA suppression may occur when used on large surface areas, for prolonged periods, or with an occlusive dressing.

Special populations:

- Pediatrics: Chronic use of corticosteroids in children may interfere with growth and development.

Geriatric ConsiderationsNo specific dose adjustment or use consideration necessary in the elderly; for oral infections, patients who wear dentures must have them removed and cleaned in order to eliminate source of reinfection.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown

Breast-Feeding Considerations

Nystatin: Compatible

Triamcinolone: No data reported

Adverse Reactions1% to 10%:

Dermatologic: Dryness, folliculitis, hypertrichosis, acne, hypopigmentation, allergic dermatitis, maceration of the skin, skin atrophy

Local: Burning, itching, irritation

Miscellaneous: Increased incidence of secondary infection

Drug Interactions

Acetylcholinesterase Inhibitors: Corticosteroids (Systemic) may enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Systemic) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Orally Inhaled) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antidiabetic Agents: Corticosteroids (Systemic) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antidiabetic Agents: Corticosteroids (Orally Inhaled) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Aprepitant: May increase the serum concentration of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Calcitriol: Corticosteroids (Systemic) may diminish the therapeutic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CycloSPORINE: Corticosteroids (Systemic) may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Estrogen Derivatives: May increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fosaprepitant: May increase the serum concentration of Corticosteroids (Systemic). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Isoniazid: Corticosteroids (Systemic) may decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Orally Inhaled) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Corticosteroids (Systemic). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents (Nondepolarizing): May enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Primidone: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Saccharomyces boulardii: Antifungal Agents may diminish the therapeutic effect of Saccharomyces boulardii. *Risk D: Consider therapy modification*

Salicylates: May enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Thiazide Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thiazide Diuretics: Corticosteroids (Orally Inhaled) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Warfarin: Corticosteroids (Systemic) may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Cream (Nystatin-Triamcinolone)

100000-0.1 units/g-% (15): $11.99

100000-0.1 units/g-% (30): $12.99

100000-0.1 units/g-% (60): $12.99

Ointment (Nystatin-Triamcinolone)

100000-0.1 units/g-% (15): $11.99

Mechanism of ActionNystatin is an antifungal agent that binds to sterols in fungal cell membrane, changing the cell wall permeability allowing for leakage of cellular contents. Triamcinolone is a synthetic corticosteroid; it decreases inflammation by suppression of migration of polymorphonuclear leukocytes and reversal of increased capillary permeability. It suppresses the immune system reducing activity and volume of the lymphatic system. It suppresses adrenal function at high doses.

Pharmacodynamics/KineticsSee individual agents.

Medication Safety Issues

Sound-alike/look-alike issues:

Nystatin may be confused with Nilstat®, Nitrostat®

Nilstat may be confused with Nitrostat®, nystatin

Pronunciation(nye STAT in)
U.S. Brand NamesBio-Statin®; Mycostatin®; Nyamyc™; Nystat-Rx®; Nystop®; Paddock Nystatin™; Pedi-Dri®
Canadian Brand NamesCandistatin®; Nilstat; Nyaderm; PMS-Nystatin
Pharmacologic CategoryAntifungal Agent, Oral Nonabsorbed; Antifungal Agent, Topical; Antifungal Agent, Vaginal
Use: Labeled IndicationsTreatment of susceptible cutaneous, mucocutaneous, and oral cavity fungal infections normally caused by the *Candida* species
Use: DentalTreatment of susceptible cutaneous, mucocutaneous, and oral cavity fungal infections normally caused by the *Candida* species
Dosing: Adults

Oral candidiasis: Suspension (swish and swallow orally): 400,000-600,000 units 4 times/day

Mucocutaneous infections: Topical: Apply 2-3 times/day to affected areas; very moist topical lesions are treated best with powder.

Intestinal infections: Oral tablets: 500,000-1,000,000 units every 8 hours

Vaginal infections: Vaginal tablets: Insert 1 tablet/day at bedtime for 2 weeks. (May also be given orally.)

Note: Powder for compounding: $^{1}/_{8}$ teaspoon (500,000 units) to equal approximately $^{1}/_{2}$ cup of water; give 4 times/day

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Oral candidiasis:

Suspension (swish and swallow orally):

Premature infants: 100,000 units 4 times/day

Infants: 200,000 units 4 times/day or 100,000 units to each side of mouth 4 times/day

Children: 400,000-600,000 units 4 times/day

Powder for compounding: Children: Refer to adult dosing.

Mucocutaneous infections: Children: Refer to adult dosing.

Administration: OralSuspension: Shake well before using. Should be swished about the mouth and retained in the mouth for as long as possible (several minutes) before swallowing.
Storage

Vaginal insert: Store in refrigerator. Protect from temperature extremes, moisture, and light.

Oral tablet, ointment, topical powder, and oral suspension: Store at controlled room temperature 15°C to 25°C (59°F to 77°F).

ContraindicationsHypersensitivity to nystatin or any component of the formulation
Geriatric ConsiderationsFor oral infections, patients who wear dentures must have them removed and cleaned in order to eliminate source of reinfection.
Pregnancy Risk FactorB/C (oral)
LactationDoes not enter breast milk/compatible (not absorbed orally)
Adverse Reactions

Frequency not defined: Dermatologic: Contact dermatitis, Stevens-Johnson syndrome

1% to 10%: Gastrointestinal: Nausea, vomiting, diarrhea, stomach pain

<1%: Hypersensitivity reactions

Oncology: Emetic PotentialLow (10% to 30%)
Drug Interactions

Saccharomyces boulardii: Antifungal Agents may diminish the therapeutic effect of Saccharomyces boulardii. *Risk D: Consider therapy modification*

Nursing: Physical Assessment/MonitoringDetermine that cause of infection is fungal. Avoid skin contact when applying. Monitor therapeutic effectiveness, adverse reactions at beginning of therapy and periodically throughout therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake as directed. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Do not allow medication to come in contact with eyes. Report persistent nausea, vomiting, or diarrhea; or if condition being treated worsens or does not improve. **Pregnancy precaution:** Inform prescriber if you are pregnant.

Oral tablet: Swallow whole; do not crush or chew.

Oral suspension: Shake well before using. Remove dentures, clean mouth (do not replace dentures until after using medications). Swish suspension in mouth for several minutes before swallowing

Oral troche: Remove dentures, clean mouth (do not replace dentures until after using medication). Allow troche to dissolve in mouth; do not chew or swallow whole.

Topical: Wash and dry area before applying (do not reuse towels without washing, apply clean clothing after use). Report unresolved burning, redness, or swelling in treated areas.

Vaginal tablet: Wash hands before using. Lie down to insert high into vagina at bedtime.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule:

Bio-Statin®: 500,000 units, 1 million units

Cream: 100,000 units/g (15 g, 30 g)

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Sandostatin® may be confused with Sandimmune®, Sandostatin LAR®, sargramostim, simvastatin

Pronunciation(ok TREE oh tide)

U.S. Brand NamesSandostatin LAR®; Sandostatin®

Canadian Brand NamesOctreotide Acetate Injection; Octreotide Acetate Omega; Sandostatin LAR®; Sandostatin®

Pharmacologic CategoryAntidiarrheal; Antidote; Somatostatin Analog

Use: Labeled IndicationsControl of symptoms in patients with metastatic carcinoid and vasoactive intestinal peptide-secreting tumors (VIPomas); treatment of acromegaly

Use: Unlabeled/InvestigationalAIDS-associated secretory diarrhea (including *Cryptosporidiosis*); control of bleeding of esophageal varices; second-line treatment for thymic malignancies; Cushing's syndrome (ectopic); insulinomas; glucagonoma; small bowel fistulas; pancreatic tumors; gastrinoma; postgastrectomy dumping syndrome; chemotherapy-induced diarrhea; graft-versus-host disease (GVHD) induced diarrhea; Zollinger-Ellison syndrome; congenital hyperinsulinism; hypothalamic obesity; treatment of hypoglycemia secondary to sulfonylurea poisoning (as an adjunct to dextrose)

Dosing: Adults

Acromegaly:

SubQ, I.V.: Initial: 50 mcg 3 times/day; titrate to achieve growth hormone levels <5 ng/mL or IGF-I (somatomedin C) levels <1.9 units/mL in males and <2.2 units/mL in females. Usual effective dose 100-200 mcg 3 times/day; range 300-1500 mcg/day. **Note:** Should be withdrawn yearly for a 4-week interval (8 weeks for depot injection) in patients who have received irradiation. Resume if levels increase and signs/symptoms recur.

I.M. depot injection: Patients must be stabilized on subcutaneous octreotide for at least 2 weeks before switching to the long-acting depot. Upon switch: 20 mg I.M. intragluteally every 4 weeks for 3 months, then the dose may be modified based upon response.

Dosage adjustment for acromegaly: After 3 months of depot injections, the dosage may be continued or modified as follows:

GH ≤1 ng/mL, IGF-1 normal, and symptoms controlled: Reduce octreotide LAR® to 10 mg I.M. every 4 weeks

GH ≤2.5 ng/mL, IGF-1 normal, and symptoms controlled: Maintain octreotide LAR® at 20 mg I.M. every 4 weeks

GH >2.5 ng/mL, IGF-1 elevated, and/or symptoms uncontrolled: Increase octreotide LAR® to 30 mg I.M. every 4 weeks

Note: Patients not adequately controlled at a dose of 30 mg may increase dose to 40 mg every 4 weeks. Dosages >40 mg are not recommended.

Carcinoid tumors:

SubQ, I.V.: Initial 2 weeks: 100-600 mcg/day in 2-4 divided doses; usual range 50-750 mcg/day (some patients may require up to 1500 mcg/day)

I.M. depot injection: Patients must be stabilized on subcutaneous octreotide for at least 2 weeks before switching to the long-acting depot. Upon switch: 20 mg I.M. intragluteally every 4 weeks for 2 months, then the dose may be modified based upon response.

Note: Patients should continue to receive their SubQ injections for the first 2 weeks at the same dose in order to maintain therapeutic levels (some patients may require 3-4 weeks of continued SubQ injections). Patients who experience periodic exacerbations of symptoms may require temporary SubQ injections in addition to depot injections (at their previous SubQ dosing regimen) until symptoms have resolved.

Dosage adjustment: See dosing adjustment for VIPomas.

VIPomas:

SubQ, I.V.: Initial 2 weeks: 200-300 mcg/day in 2-4 divided doses; titrate dose based on response/tolerance. Range: 150-750 mcg/day (doses >450 mcg/day are rarely required)

I.M. depot injection: Patients must be stabilized on subcutaneous octreotide for at least 2 weeks before switching to the long-acting depot. Upon switch: 20 mg I.M. intragluteally every 4 weeks for 2 months, then the dose may be modified based upon response.

Note: Patients receiving depot injection should continue to receive their SubQ injections for the first 2 weeks at the same dose in order to maintain therapeutic levels (some patients may require 3-4 weeks of continued SubQ injections). Patients who experience periodic exacerbations of symptoms may require temporary SubQ injections in addition to depot injections (at their previous SubQ dosing regimen) until symptoms have resolved.

Dosage adjustment for carcinoid tumors and VIPomas: After 2 months of depot injections, the dosage may be continued or modified as follows:

Increase to 30 mg I.M. every 4 weeks if symptoms are inadequately controlled

Decrease to 10 mg I.M. every 4 weeks, for a trial period, if initially responsive to 20 mg dose

Dosage >30 mg is not recommended

Diarrhea (unlabeled use): I.V.: Initial: 50-100 mcg every 8 hours; increase by 100 mcg/dose at 48-hour intervals; maximum dose: 500 mcg every 8 hours

Esophageal varices bleeding (unlabeled use): I.V. bolus: 25-50 mcg followed by continuous I.V. infusion of 25-50 mcg/hour

Hypoglycemia in sulfonylurea poisoning (unlabeled use): SubQ is the preferred route of administration; repeat dosing or initiation of a continuous infusion may be required in patients who experience recurrent hypoglycemia. Duration of treatment may exceed 24 hours. Optimal care decisions should be made based upon patient-specific details:

SubQ (preferred route of administration): 50-100 mcg; repeat in 6-12 hours as needed based upon blood glucose concentrations

I.V.: Doses up to 100-125 mcg/hour have been used successfully

Dosing: ElderlyRefer to adult dosing. Elimination half-life is increased by 46% and clearance is decreased by 26%; dose adjustment may be required. Dosing should generally begin at the lower end of dosing range.

Dosing: PediatricInfants and Children:

Secretory diarrhea (unlabeled use): I.V., SubQ: Doses of 1-10 mcg/kg every 12 hours have been used in children beginning at the low end of the range and increasing by 0.3 mcg/kg/dose at 3-day intervals. Suppression of growth hormone (animal data) is of concern when used as long-term therapy.

Congenital hyperinsulinism (unlabeled use): SubQ: Doses of 3-40 mcg/kg/day have been used.

Hypoglycemia in sulfonylurea poisoning (unlabeled use): SubQ is the preferred route of administration; repeat dosing or initiation of a continuous infusion may be required in patients who experience recurrent hypoglycemia. Duration of treatment may exceed 24 hours. Optimal care decisions should be made based upon patient-specific details: SubQ: 1-1.5 mcg/kg (maximum dose: 50 mcg); repeat in 6-12 hours as needed based upon blood glucose concentrations

Dosing: Renal Impairment
Nondialysis-dependent renal impairment: No dosage adjustment required

Dialysis-dependent renal impairment: Depot injection: Initial dose: 10 mg I.M. every 4 weeks; titrate based upon response (clearance is reduced by ~50%)

Dosing: Hepatic ImpairmentPatients with established cirrhosis of the liver: Depot injection: Initial dose: 10 mg I.M. every 4 weeks; titrate based upon response.

Administration: I.M.Depot formulation: Administer I.M. intragluteal (avoid deltoid administration); alternate gluteal injection sites to avoid irritation. Do not administer Sandostatin LAR® intravenously or subcutaneously; must be administered immediately after mixing.

Administration: I.V.Regular injection only (not suspension): IVP should be administered undiluted over 3 minutes. IVPB should be administered over 15-30 minutes. Continuous I.V. infusion rates have ranged from 25-50 mcg/hour for the treatment of esophageal variceal bleeding (unlabeled route/use); continuous I.V. infusion rates of 100-125 mcg/hour have been used for the treatment of sulfonylurea-induced hypoglycemia (unlabeled use).

Administration: I.V. DetailDo not use if solution contains particles or is discolored. I.V. administration may be IVP, IVPB, or continuous I.V. infusion (unlabeled route).

pH: 4.0-4.6

Administration: OtherSubQ: Regular injection formulation (not depot) can be administered SubQ. Use the concentration with smallest volume to deliver dose to reduce injection site pain. Rotate injection site; may bring to room temperature prior to injection.

Dietary ConsiderationsSchedule injections between meals to decrease GI effects. May alter absorption of dietary fats.

Storage

Solution: Octreotide is a clear solution and should be stored at refrigerated temperatures between 2°C and 8°C (36°F and 46°F). Protect from light. May be stored at room temperature of 20°C to 30°C (70°F and 86°F) for up to 14 days when protected from light. Stability of parenteral admixture is stable in NS for 96 hours at room temperature (25°C) and in D_5W for 24 hours. Discard multidose vials within 14 days after initial entry.

Suspension: Prior to dilution, store at refrigerated temperatures between 2°C and 8°C (36°F and 46°F) and protect from light. Depot drug product kit may be at room temperature for 30-60 minutes prior to use. Use suspension immediately after preparation.

CompatibilitySolution: Stable in D_5W, NS; **incompatible** with fat emulsion 10%; **variable stability** in TPN (The manufacturer states that octreotide solution is not compatible in TPN solutions due to the formation of a glycosyl octreotide conjugate which may have decreased activity; other sources give it limited compatibility.)

Y-site administration:Incompatible: Micafungin. **Variable (consult detailed reference):** Pantoprazole, TPN.

Compatibility when admixed: Compatible: Heparin. **Incompatible:** Pantoprazole.

ContraindicationsHypersensitivity to octreotide or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Abnormal Schillings test: Chronic treatment has been associated with abnormal Schillings test; monitor vitamin B_{12} levels.

- Cholelithiasis: May impair gallbladder function (inhibits gallbladder contractility and decreases bile secretion); monitor patients for cholelithiasis.

- Hypothyroidism: Suppresses secretion of TSH; monitor for hypothyroidism.

- Pancreatitis: May alter absorption of dietary fats; monitor for pancreatitis.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with heart failure or concomitant medications that alter heart rate or rhythm; bradycardia, conduction abnormalities, and arrhythmia have been observed in acromegalic and carcinoid syndrome patients. Cardiovascular medication requirements may change.

- Diabetes: Somatostatin analogs may affect glucose regulation. In type I diabetes, severe hypoglycemia may occur; in type II diabetes or patients without diabetes, hyperglycemia may occur. Insulin and other hypoglycemic medication requirements may change.

- Excessive fluid loss: May reduce excessive fluid loss in patients with conditions that cause such a loss; periodic monitoring for elevations in zinc levels is recommended in such patients that are maintained on total parenteral nutrition (TPN).

- Hepatic impairment: Use caution in patients with hepatic impairment; dosage adjustment required in patients with established cirrhosis

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment required in patients receiving dialysis.

Concurrent drug therapy issues:

- QT_c-prolonging agents: Octreotide may enhance the adverse/toxic effects of other QT_c-prolonging agents.

Dosage form specific issues:

- Depot formulation: Do not use depot formulation for the treatment of sulfonylurea-induced hypoglycemia.

- Vehicle used in depot injection (polylactide-co-glycolide microspheres): Has rarely been associated with retinal artery occlusion in patients with abnormal arteriovenous anastomosis (eg, patent foramen ovale).

Special populations:

- Elderly: Dosage adjustment may be necessary; significant increases in elimination half-life have been observed in older adults.

- Females: Therapy may restore fertility; females of childbearing potential should use adequate contraception.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. Octreotide crosses the human placenta; data concerning use in pregnancy is limited. Women of childbearing potential should use adequate contraception during treatment with octreotide; normalization of IGF-1 and GH may restore fertility in women with acromegaly. In case reports of acromegalic women who received normal doses of octreotide during pregnancy, no congenital malformations were reported.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsAdverse reactions vary by route of administration and dosage form. Frequency of cardiac, endocrine, and gastrointestinal adverse reactions was generally higher in acromegalics.

>16%:

Cardiovascular: Sinus bradycardia (19% to 25%), chest pain (≤20%; non-depot formulations)

Central nervous system: Fatigue (1% to 32%), headache (6% to 30%), malaise (16% to 20%), fever (16% to 20%), dizziness (5% to 20%)

Dermatologic: Pruritus (≤18%)

Endocrine & metabolic: Hyperglycemia (2% to 27%)

Gastrointestinal: Abdominal pain (5% to 61%), loose stools (5% to 61%), nausea (5% to 61%), diarrhea (34% to 58%), flatulence (≤38%), cholelithiasis (13% to 38%; length of therapy dependent), biliary sludge (24%; length of therapy dependent), constipation (9% to 21%), vomiting (4% to 21%), biliary duct dilatation (12%)

Local: Injection site pain (2% to 50%; dose and formulation related)

Neuromuscular & skeletal: Back pain (1% to 27%), arthropathy (8% to 19%), myalgia (≤18%)

Respiratory: Upper respiratory infection (10% to 23%), dyspnea (≤20%; non-depot formulations)

Miscellaneous: Antibodies to octreotide (up to 25%; no efficacy change), flu symptoms (1% to 20%)

5% to 15%:

Cardiovascular: Hypertension (≤13%), conduction abnormalities (9% to 10%), arrhythmia (3% to 9%), palpitation, peripheral edema

Central nervous system: Pain (4% to 15%), anxiety, confusion, hypoesthesia, insomnia

Dermatologic: Rash (15%; depot formulation), alopecia (≤13%)

Endocrine & metabolic: Hypothyroidism (≤12%; non-depot formulations), goiter (≤8%; non-depot formulations)

Gastrointestinal: Anorexia, cramping, tenesmus (4% to 6%), dyspepsia (4% to 6%), steatorrhea (4% to 6%), feces discoloration (4% to 6%)

Hematologic: Anemia (≤15%; non-depot formulations: <1%)

Neuromuscular & skeletal: Arthralgia, myalgia, paresthesia, rigors, weakness

Otic: Earache

Renal: Renal calculus

Respiratory: Cough, pharyngitis, sinusitis, rhinitis

Miscellaneous: Allergy, diaphoresis

1% to 4%:

Cardiovascular: Angina, cardiac failure, edema, flushing, hematoma, phlebitis

Central nervous system: Abnormal gait, amnesia, depression, dysphonia, hallucinations, nervousness, neuralgia, somnolence, vertigo

Dermatologic: Acne, bruising, cellulitis

Endocrine & metabolic: Hypoglycemia (2% to 4%), hypokalemia, hypoproteinemia, gout, cachexia, breast pain, impotence

Gastrointestinal: Colitis, diverticulitis, dysphagia, fat malabsorption, gastritis, gastroenteritis, gingivitis, glossitis, melena, stomatitis, taste perversion, xerostomia

Genitourinary: Incontinence, pollakuria (non-depot formulations), urinary tract infection

Local: Injection site hematoma

Neuromuscular & skeletal: Hyperkinesia, hypertonia, joint pain, neuropathy, tremor

Ocular: Blurred vision, visual disturbance

Otic: Tinnitus

Renal: Albuminuria, renal abscess

Respiratory: Bronchitis, epistaxis

Miscellaneous: Bacterial infection, cold symptoms, moniliasis

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Anaphylactic shock, anaphylactoid reaction, aneurysm, aphasia, appendicitis, arthritis, ascending cholangitis, ascites, atrial fibrillation, basal cell carcinoma, Bell's palsy, biliary obstruction, breast carcinoma, cardiac arrest, cerebral vascular disorder, CHF, cholestatic hepatitis, CK increased, creatinine increased, deafness, diabetes insipidus, diabetes mellitus, facial edema, fatty liver, galactorrhea, gallbladder polyp, GI bleeding, GI hemorrhage, GI ulcer, glaucoma, gynecomastia, hearing loss, hematuria, hemiparesis, hemorrhoids, hepatitis, hyperesthesia, hypertensive reaction, hypoadrenalism, intestinal obstruction, intracranial hemorrhage, intraocular pressure increased, ischemia, jaundice, joint effusion, lactation, LFTs increased, libido decreased, malignant hyperpyrexia, menstrual irregularities, MI, migraine, nephrolithiasis, neuritis, orthostatic hypotension, pancreatitis, pancytopenia, paresis, petechiae, pituitary apoplexy, pleural effusion, pneumonia, pneumothorax, pulmonary embolism, pulmonary hypertension, pulmonary nodule, Raynaud’s syndrome, rectal bleeding, renal failure, renal insufficiency, retinal vein thrombosis, scotoma, seizure, status asthmaticus, suicide attempt, syncope, tachycardia, thrombocytopenia, thrombophlebitis, thrombosis, urticaria, visual field defect, weight loss, wheal/erythema

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Codeine: Somatostatin Analogs may decrease the metabolism of Codeine. The formation of two major codeine metabolites (morphine and norcodeine) may be impaired by somatostatin analogs. *Risk C: Monitor therapy*

CycloSPORINE: Somatostatin Analogs may decrease the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Pegvisomant: Somatostatin Analogs may enhance the adverse/toxic effect of Pegvisomant. Specifically, this combination may increase the risk for significant elevations of liver enzymes. *Risk C: Monitor therapy*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Herb/Nutraceutical: Avoid hypoglycemic herbs, including alfalfa, aloe, bilberry, bitter melon, burdock, celery, damiana, fenugreek, garcinia, garlic, ginger, ginseng (American), gymnema, marshmallow, and stinging nettle (may enhance the hypoglycemic effect of octreotide).

Monitoring Parameters

Acromegaly: Growth hormone, somatomedin C (IGF-1)

Carcinoid: 5-HIAA, plasma serotonin and plasma substance P

VIPomas: Vasoactive intestinal peptide

Chronic therapy: Thyroid function (baseline and periodic), vitamin B_{12} level, blood glucose, cardiac function (heart rate, EKG), zinc level (patients with excessive fluid loss maintained on TPN)

Reference RangeVasoactive intestinal peptide: <75 ng/L; levels vary considerably between laboratories

Nursing: Physical Assessment/MonitoringUse caution in presence of renal and/or hepatic impairment (dosage adjustment may be necessary). Assess all other pharmacological or herbal products patient may be taking for potential interactions or toxicity (eg, may effect response to insulin or sulfonylureas and/or response to cardiovascular medications). See Administration for I.V., I.M., and SubQ specifics. Follow specific dosing directions when switching from SubQ to long-acting depot formulation. Assess results of laboratory tests on a regular basis with chronic therapy. Evaluate therapeutic effectiveness according to purpose for use and adverse effects (eg, hypo-/hyperglycemia, hypothyroidism, cardiovascular changes, GI disturbances, CNS changes, dyspnea). Caution patients with diabetes to monitor serum glucose closely; may affect response to insulin or sulfonylureas. Teach patient proper use if self-administered (appropriate injection technique and syringe/needle disposal), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab Tests

Acromegaly: Growth hormone, somatomedin C (IGF-1)

Carcinoid: 5-HIAA, plasma serotonin and plasma substance P

VIPomas: Vasoactive intestinal peptide

Chronic therapy: Thyroid function (baseline and periodic), vitamin B_{12} level, blood glucose, zinc level (patients with excessive fluid loss maintained on TPN)

Patient EducationDo not take any new prescription or over-the-counter medications, or herbal products during therapy without consulting prescriber (especially any other antidiarrheals or “stomach” medications). If self-administered, follow instructions for injection and syringe/needle disposal. Schedule injections between meals to decrease GI effects. Consult prescriber about appropriate diet. If you have diabetes, monitor serum glucose closely and notify prescriber of significant changes (this drug may alter the effects of insulin or sulfonylureas). May cause skin flushing; nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); dizziness, fatigue, or drowsiness (use caution when driving or engaging in tasks that require alertness until response to drug is known); joint or muscle pain (consult prescriber for appropriate analgesia). Report unusual weight gain, swelling of extremities, or respiratory difficulty; acute or persistent GI distress (eg, diarrhea, vomiting, constipation, abdominal pain); muscle weakness or tremors or loss of motor function; chest pain or palpitations; blurred vision; depression; or redness, swelling, burning, or pain at injection site; or any other persistent adverse effect. **Breast-feeding precaution:** Inform prescriber if you are breast feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, microspheres for suspension, as acetate [depot formulation]:

Sandostatin LAR®: 10 mg, 20 mg, 30 mg [contains polylactide-co-glycolide; packaged with diluent and syringe]

Injection, solution, as acetate: 0.2 mg/mL (5 mL); 1 mg/mL (5 mL)

Sandostatin®: 0.2 mg/mL (5 mL); 1 mg/mL (5 mL)

Injection, solution, as acetate [preservative free]: 0.05 mg/mL (1 mL); 0.1 mg/mL (1 mL); 0.5 mg/mL (1 mL)

Sandostatin®: 0.05 mg/mL (1 mL); 0.1 mg/mL (1 mL); 0.5 mg/mL (1 mL)

Generic AvailableYes: Injection solution (excludes depot formulation)

Pricing: U.S. (www.drugstore.com)

Kit (Sandostatin LAR Depot)

20 mg (1): $2311.99

Solution (Sandostatin)

50 mcg/mL (1): $19.99

1000 mcg/mL (5): $1052.89

Mechanism of ActionMimics natural somatostatin by inhibiting serotonin release, and the secretion of gastrin, VIP, insulin, glucagon, secretin, motilin, and pancreatic polypeptide. Decreases growth hormone and IGF-1 in acromegaly. Octreotide provides more potent inhibition of growth hormone, glucagon, and insulin as compared to endogenous somatostatin. Also suppresses LH response to GnRH, secretion of thyroid-stimulating hormone and decreases splanchnic blood flow.

Pharmacodynamics/Kinetics

Duration: SubQ: 6-12 hours

Absorption: SubQ: Rapid and complete; I.M. (depot formulation): Released slowly (via microsphere degradation in the muscle)

Distribution: V_d: 14 L (13-30 L in acromegaly)

Protein binding: 65%, mainly to lipoprotein (41% in acromegaly)

Metabolism: Extensively hepatic

Bioavailability: SubQ: 100%; I.M: 60% to 63% of SubQ dose

Half-life elimination: 1.7-1.9 hours; Increased in elderly patients; Cirrhosis: Up to 3.7 hours; Fatty liver disease: Up to 3.4 hours; Renal impairment: Up to 3.1 hours

Time to peak, plasma: SubQ: 0.4 hours (0.7 hours acromegaly); I.M.: 1 hour

Excretion: Urine (32% as unchanged drug)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation), gingivitis, glossitis, stomatitis, taste perversion, and dysphagia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsOctreotide is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, mepivacaine and levonordefrin [Carbocaine® 2% with Neo-Cobefrin®]) be used with caution.

Mental Health: Effects on Mental StatusMay cause drowsiness, dizziness, or depression; may rarely cause anxiety

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsNSC-671663; Octreotide Acetate

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Floxin® may be confused with Flexeril®

Ocuflox® may be confused with Occlusal®-HP, Ocufen®

International issues:

Floxin® may be confused with Flogen® which is a brand name for naproxen in Mexico

Floxin® may be confused with Fluoxin® which is a brand name for fluoxetine in the Czech Republic and Romania

Floxin® may be confused with Flexin® which is a brand name for orphenadrine in Israel and indomethacin in Great Britain

Pronunciation(oh FLOKS a sin)

U.S. Brand NamesFloxin®; Ocuflox®

Canadian Brand NamesApo-Ofloxacin® ; Apo-Oflox®; Floxin®; Novo-Ofloxacin; Ocuflox®; PMS-Ofloxacin

Pharmacologic CategoryAntibiotic, Quinolone

Use: Labeled Indications Quinolone antibiotic for the treatment of acute exacerbations of chronic bronchitis, community-acquired pneumonia, skin and skin structure infections (uncomplicated), urethral and cervical gonorrhea (acute, uncomplicated), urethritis and cervicitis (nongonococcal), mixed infections of the urethra and cervix, pelvic inflammatory disease (acute), cystitis (uncomplicated), urinary tract infections (complicated), prostatitis

Note: As of April 2007, the CDC no longer recommends the use of fluoroquinolones for the treatment of gonococcal disease.

Ophthalmic: Treatment of superficial ocular infections involving the conjunctiva or cornea due to strains of susceptible organisms

Otic: Otitis externa, chronic suppurative otitis media, acute otitis media

Use: Unlabeled/InvestigationalEpididymitis (nongonococcal), leprosy, Traveler's diarrhea

Dosing: Adults

Cervicitis/urethritis (nongonococcal):

Nongonococcal: 300 mg every 12 hours for 7 days

Gonococcal (acute, uncomplicated): 400 mg as a single dose; **Note:** As of April 2007, the CDC no longer recommends the use of fluoroquinolones for the treatment of uncomplicated gonococcal disease.

Chronic bronchitis (acute exacerbation), community-acquired pneumonia, skin and skin structure infections (uncomplicated): 400 mg every 12 hours for 10 days

Conjunctivitis: Ophthalmic: Instill 1-2 drops in affected eye(s) every 2-4 hours for the first 2 days, then use 4 times/day for an additional 5 days.

Corneal ulcer: Ophthalmic: Instill 1-2 drops every 30 minutes while awake and every 4-6 hours after retiring for the first 2 days; beginning on day 3, instill 1-2 drops every hour while awake for 4-6 additional days; thereafter, 1-2 drops 4 times/day until clinical cure.

Epididymitis, nongonococcal (unlabeled use): 300 mg twice daily for 10 days

Leprosy (unlabeled use): 400 mg once daily

Otitis media, chronic suppurative with perforated tympanic membranes: Otic: Instill 10 drops (or the contents of 2 single-dose containers) into affected ear twice daily for 14 days

Otitis externa: Otic: Instill 10 drops (or the contents of 2 single-dose containers) into affected ear(s) once daily for 7 days

Pelvic inflammatory disease (acute): 400 mg every 12 hours for 10-14 days; **Note:** The CDC recommends use only if standard cephalosporin therapy is not feasible and community prevalence of quinolone-resistant gonococcal organisms is low. Culture sensitivity must be confirmed.

Prostatitis:

Acute: 400 mg for 1 dose, then 300 mg twice daily for 10 days

Chronic: 200 mg every 12 hours for 6 weeks

Traveler's diarrhea (unlabeled use): 300 mg twice daily for 3 days

UTI:

Uncomplicated: 200 mg every 12 hours for 3-7 days

Complicated: 200 mg every 12 hours for 10 days

Dosing: ElderlyOral: 200-400 mg every 12-24 hours (based on estimated renal function) for 7 days to 6 weeks depending on indication.
Dosing: PediatricNot for systemic use

Acute otitis media with tympanotomy tubes: Otic: Children 1-12 years: Instill 5 drops (or the contents of 1 single-dose container) into affected ear twice daily for 10 days.

Conjunctivitis: Ophthalmic: Children ≥1 year: Refer to adult dosing.

Corneal ulcer: Ophthalmic: Children ≥1 year: Refer to adult dosing.

Otitis externa: Otic:

Children 6 months to 13 years: Instill 5 drops (or the contents of 1 single-dose container) into affected ear(s) once daily for 7 days

Children ≥13 years: Refer to adult dosing.

Otitis media, chronic suppurative with perforated tympanic membranes: Otic: Children >12 years: Refer to adult dosing.

Dosing: Renal ImpairmentAdults: Oral: After a normal initial dose, adjust as follows:

Cl_{cr} 20-50 mL/minute: Administer usual dose every 24 hours

Cl_{cr} <20 mL/minute: Administer half the usual dose every 24 hours

Continuous arteriovenous or venovenous hemodiafiltration effects: Administer 300 mg every 24 hours

Dosing: Hepatic ImpairmentSevere impairment: Maximum dose: 400 mg/day
Calculations

- Creatinine Clearance: Adults

Administration: OralDo not take within 2 hours of food or any antacids which contain zinc, magnesium, or aluminum.
Administration: Other

Ophthalmic: For ophthalmic use only; avoid touching tip of applicator to eye or other surfaces.

Otic: Prior to use, warm solution by holding container in hands for 1-2 minutes. Patient should lie down with affected ear upward and medication instilled. Pump tragus 4 times to ensure penetration of medication. Patient should remain in this position for 5 minutes.

Storage

Ophthalmic and otic solution: Store between 15°C to 25°C (59°F to 77°F).

Otic Singles™: Store between 15°C to 30°C (59°F to 86°F). Store in pouch to protect from light.

Tablet: Store below 30°C (86°F).

RestrictionsAn FDA-approved patient medication guide is available and must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.
ContraindicationsHypersensitivity to ofloxacin or other members of the quinolone group, such as nalidixic acid, oxolinic acid, cinoxacin, norfloxacin, and ciprofloxacin; hypersensitivity to any component of the formulation
Warnings/Precautions

Boxed Warnings:

- Tendon inflammation/rupture: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Altered cardiac conduction: Fluoroquinolones may prolong QT_c interval; avoid use in patients with a history of QT_c prolongation, uncorrected hypokalemia, hypomagnesemia, or concurrent administration of other medications known to prolong the QT interval (including Class Ia and Class III antiarrhythmics, cisapride, erythromycin, antipsychotics, and tricyclic antidepressants).

- CNS stimulation: Tremor, restlessness, confusion, and very rarely hallucinations or seizures may occur; use with caution in patients with known or suspected CNS disorder. Discontinue in patients who experience significant CNS adverse effects (eg, dizziness, hallucinations, suicidal ideations or actions).

- Glucose regulation: Fluoroquinolones have been associated with the development of serious, and sometimes fatal, hypoglycemia. These events have occurred most often in elderly patients with diabetes, but have also been reported in patients without a prior history of diabetes. Prompt identification and treatment of hypoglycemia is essential. Individual quinolones may differ in their potential to cause this effect. It was most evident with gatifloxacin (no longer marketed as s systemic formulation). Hyperglycemia has also been associated with the use of fluoroquinolones. Patients should be monitored closely for signs/symptoms of disordered glucose regulation.

- Hypersensitivity reactions: Severe hypersensitivity reactions, including anaphylaxis, have occurred with quinolone therapy. The spectrum of these reactions can vary widely; reactions may present as typical allergic symptoms (eg, itching, urticaria, rash, edema) after a single dose, or may manifest as severe idiosyncratic dermatologic (eg, Stevens-Johnson, toxic epidermal necrolysis), vascular (eg, vasculitis), pulmonary (eg, pneumonitis), renal (eg, nephritis), hepatic (eg, hepatic failure or necrosis), and/or hematologic (eg, anemia, cytopenias) events, usually after multiple doses. Prompt discontinuation of drug should occur if skin rash or other symptoms arise.

- Peripheral neuropathy: The use of quinolones has been linked to peripheral neuropathy (rare); discontinue if symptoms of sensory or sensorimotor neuropathy occur.

- Phototoxicity: Avoid excessive sunlight and take precautions to limit exposure (eg, loose fitting clothing, sunscreen); may cause moderate-to-severe phototoxicity reactions. Discontinue use if photosensitivity occurs.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

- Tendon inflammation/rupture: **[U.S. Boxed Warning]: There have been reports of tendon inflammation and/or rupture with quinolone antibiotics; risk may be increased with concurrent corticosteroids, organ transplant recipients, and in patients >60 years of age.** Rupture of the Achilles tendon sometimes requiring surgical repair has been reported most frequently; but other tendon sites (eg, rotator cuff, biceps) have also been reported. Strenuous physical activity may be an independent risk factor for tendonitis. Discontinue at first sign of tendon inflammation or pain. May occur even after discontinuation of therapy.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Myasthenia gravis: Some quinolones may exacerbate myasthenia gravis; use with caution (rare, potentially life-threatening weakness of respiratory muscles may occur).

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment required. May increase risk of tendon rupture.

- Rheumatoid arthritis: Use with caution in patients with rheumatoid arthritis; may increase risk of tendon rupture.

- Seizures: Use with caution in individuals at risk of seizures (CNS disorders or concurrent therapy with medications which may lower seizure threshold). Potential for seizures, although very rare, may be increased with concomitant NSAID therapy.

- Syphilis: Since ofloxacin is ineffective in the treatment of syphilis and may mask symptoms, all patients should be tested for syphilis at the time of gonorrheal diagnosis and 3 months later.

Special populations:

- Elderly: Adverse effects (eg, tendon rupture, QT changes) may be increased in the elderly.

- G6PD deficiency: Hemolytic reactions may (rarely) occur with quinolone use in patients with latent or actual G6PD deficiency.

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsDosage must be carefully adjusted to renal function. The half-life of ofloxacin may be prolonged and serum concentrations are elevated in elderly patients even in the absence of overt renal impairment. The risk of torsade de pointes and tendon inflammation and/or rupture associated with the concomitant use of corticosteroids and quinolones is increased in the elderly population. See Warnings/Precautions regarding tendon rupture in patients >60 years of age.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdverse events have been observed in some animal studies; therefore, the manufacturer classifies ofloxacin as pregnancy category C. Ofloxacin crosses the placenta and produces measurable concentrations in the amniotic fluid. An increased risk of teratogenic effects has not been observed in animals or humans following ofloxacin use during pregnancy; however, because of concerns of cartilage damage in immature animals, ofloxacin should only be used during pregnancy if a safer option is not available. Serum concentrations of ofloxacin may be lower during pregnancy than in nonpregnant patients.

LactationEnters breast milk/not recommended (AAP rates “compatible”)

Breast-Feeding ConsiderationsOfloxacin is excreted in breast milk. Breast-feeding is not recommended by the manufacturer. The AAP considers ofloxacin to be “usually compatible with breast-feeding.” Due to the low concentrations in human milk, minimal toxicity would be expected in the nursing infant. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Ofloxacin in Pregnancy & Lactation

Adverse Reactions

Systemic:

1% to 10%:

Cardiovascular: Chest pain (1% to 3%)

Central nervous system: Headache (1% to 9%), insomnia (3% to 7%), dizziness (1% to 5%), fatigue (1% to 3%), somnolence (1% to 3%), sleep disorders (1% to 3%), nervousness (1% to 3%), pyrexia (1% to 3%)

Dermatologic: Rash/pruritus (1% to 3%)

Gastrointestinal: Diarrhea (1% to 4%), vomiting (1% to 4%), GI distress (1% to 3%), abdominal cramps (1% to 3%), flatulence (1% to 3%), abnormal taste (1% to 3%), xerostomia (1% to 3%), appetite decreased (1% to 3%), nausea (3% to 10%), constipation (1% to 3%)

Genitourinary: Vaginitis (1% to 5%), external genital pruritus in women (1% to 3%)

Ocular: Visual disturbances (1% to 3%)

Respiratory: Pharyngitis (1% to 3%)

Miscellaneous: Trunk pain

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Anaphylaxis reactions, anxiety, blurred vision, chills, cognitive change, cough, depression, dream abnormality, ecchymosis, edema, erythema nodosum, euphoria, extremity pain, hallucinations, hearing acuity decreased, hepatic dysfunction, hepatic failure (some fatal), hepatitis, hyper-/hypoglycemia, hypertension, interstitial nephritis, lightheadedness, malaise, myasthenia gravis exacerbation, palpitation, paresthesia, peripheral neuropathy, photophobia, photosensitivity, pneumonitis, psychotic reactions, rhabdomyolysis, seizure, Stevens-Johnson syndrome, syncope, tendonitis and tendon rupture, thirst, tinnitus, torsade de pointes, Tourette's syndrome, toxic epidermal necrolysis, vasculitis, vasodilation, vertigo, weakness, weight loss

Ophthalmic: Frequency not defined:

Central nervous system: Dizziness

Gastrointestinal: Nausea

Ocular: Blurred vision, burning, chemical conjunctivitis/keratitis, discomfort, dryness, edema, eye pain, foreign body sensation, itching, photophobia, redness, stinging, tearing

Otic:

>10%: Local: Application site reaction (<1% to 17%)

1% to 10%:

Central nervous system: Dizziness (≤1%), vertigo (≤1%)

Dermatologic: Pruritus (1% to 4%), rash (1%)

Gastrointestinal: Taste perversion (7%)

Neuromuscular & skeletal: Paresthesia (1%)

<1% (Limited to important or life-threatening): Diarrhea, fever, headache, hearing loss (transient), hypertension, nausea, otorrhagia, tinnitus, tremor, vomiting, xerostomia

Postmarketing and/case reports: Transient neuropsychiatric disturbances

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Metabolism/Transport Effects**Inhibits** CYP1A2 (strong)

Drug Interactions

Antacids: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. **Exceptions:** Sodium Bicarbonate. *Risk D: Consider therapy modification*

Bendamustine: CYP1A2 Inhibitors (Strong) may increase the serum concentration of Bendamustine. Concentrations of the active metabolites of bendamustine may be decreased. *Risk C: Monitor therapy*

Calcium Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. **Exceptions:** Calcium Chloride. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Quinolone Antibiotics may enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

CYP1A2 Substrates: CYP1A2 Inhibitors (Strong) may decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

Didanosine: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents (excludes enteric coated formulation of didanosine). *Risk D: Consider therapy modification*

Insulin: May enhance the hyperglycemic effect of Quinolone Antibiotics. Insulin may enhance the hypoglycemic effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Iron Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Magnesium Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Mycophenolate: Quinolone Antibiotics may decrease the serum concentration of Mycophenolate. Specifically, quinolones may decrease concentrations of the active metabolite of mycophenolate. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Probenecid: May increase the serum concentration of Quinolone Antibiotics. *Risk C: Monitor therapy*

Quinapril: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

Sevelamer: May decrease the absorption of Quinolone Antibiotics. *Risk D: Consider therapy modification*

Sucralfate: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

Sulfonylureas: Quinolone Antibiotics may enhance the hypoglycemic effect of Sulfonylureas. This appears to be particularly concerning early in the course of combination therapy. Quinolone Antibiotics may diminish the hypoglycemic effect of Sulfonylureas. With longer-term combination, there is a greater risk of hyperglycemia. *Risk C: Monitor therapy*

Theophylline Derivatives: Quinolone Antibiotics may decrease the metabolism of Theophylline Derivatives. Ciprofloxacin and enoxacin are of greatest concern. Theophylline/quinolone therapy might augment the seizure-producing potential of each of the individual agents. **Exceptions:** Dyphylline. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Quinolone Antibiotics may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Zinc Salts: May decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Food: Ofloxacin average peak serum concentrations may be decreased by 20% if taken with food.

Herb/Nutraceutical: Avoid dong quai, St John's wort (may also cause photosensitization).

Test InteractionsSome quinolones may produce a false-positive urine screening result for opiates using commercially-available immunoassay kits. This has been demonstrated most consistently for levofloxacin and ofloxacin, but other quinolones have shown cross-reactivity in certain assay kits. Confirmation of positive opiate screens by more specific methods should be considered.

Nursing: Physical Assessment/MonitoringAssess results of culture and sensitivity tests and patient's allergy history before initiating therapy. Use caution with known or suspected CNS disorders; current or potential for QT prolongation; renal impairment; or diabetes. Assess potential for interactions with other pharmacological or herbal agents patient may be taking. See administration specifics for different formulations (otic, ophthalmic, oral). Patient should be monitored closely; if an allergic reaction occurs (itching, urticaria, dyspnea or facial edema, loss of consciousness, tingling, cardiovascular collapse), drug should be discontinued immediately and prescriber notified. Evaluate results of laboratory tests, therapeutic effectiveness (resolution of infection), and adverse reactions (eg, hypersensitivity reactions [severe reactions, including anaphylaxis, have occurred with quinolone therapy], opportunistic infection, tendon rupture, persistent diarrhea [*C. difficile*-associated colitis can occur up to 2 months post treatment]) regularly during prolonged therapy. Teach patient proper use (according to formulation), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsPerform culture and sensitivity studies before initiating therapy. Monitor CBC, renal and hepatic function periodically if therapy is prolonged.

Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. Take oral tablets as directed on an empty stomach (2 hours before or 2 hours after meals, dairy products, antacids, or other medication). Complete full course of therapy, even if symptoms resolve. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Consult prescriber before having any vaccination. May cause dizziness, lightheadedness, or headache (use caution when driving or engaging in tasks that require alertness until response to drug is known); nausea, vomiting, or taste perversion (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). If inflammation or tendon pain occurs or you experience signs of an allergic reaction (eg, itching, urticaria, respiratory difficulty, facial edema or difficulty swallowing, loss of consciousness, tingling, chest pain, palpitations), discontinue use and contact prescriber immediately. Report GI disturbances; CNS changes (eg, excessive sleepiness, agitation, tremors); skin rash; vision changes; respiratory difficulty; signs of opportunistic infection (eg, sore throat, chills, fever, burning, itching on urination, vaginal discharge, white plaques in mouth); persistent diarrhea (especially if it lasts after completing prescription); or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Ophthalmic: Wash hands before instilling solution. Sit or lie down to instill. Open eye, look at ceiling, and instill prescribed amount of solution as directed. Close eye, roll eye in all directions, and apply gentle pressure to inner corner of eye. Do not touch tip of applicator or let tip of applicator touch eye (may cause eye infection, eye damage, or vision loss). Do not wear contact lenses during therapy. Temporary stinging, blurred vision, dry eyes, or a bad taste in your mouth may occur after installation. Report persistent pain, burning, excessive tearing, decreased visual acuity, swelling, itching, or worsening of condition.

Otic: Wash hands before and after applying drops. Warm solution by holding container in hands for a few minutes. Lie with affected ear up and instill prescribed number of drops into ear. Remain on side with ear up for 5 minutes.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, ophthalmic [drops]: 0.3% (5 mL, 10 mL)

Ocuflox®: 0.3% (5 mL) [contains benzalkonium chloride]

Solution, otic [drops]: 0.3% (5 mL, 10 mL)

Floxin®: 0.3% (5 mL, 10 mL) [contains benzalkonium chloride]

Floxin® Otic Singles™: 0.3% (0.25 mL) [contains benzalkonium chloride; packaged as 2 single-dose containers per pouch, 10 pouches per carton, total net volume 5 mL]

Tablet: 200 mg, 300 mg, 400 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (Floxin Otic)

0.3% (5): $75.99

0.3% (10): $136.04

Solution (Ocuflox)

0.3% (5): $52.99

0.3% (10): $91.61

Solution (Ofloxacin)

0.3% (5): $17.99

0.3% (5): $59.99

0.3% (10): $40.00

0.3% (10): $92.99

Tablets (Ofloxacin)

200 mg (14): $53.99

300 mg (14): $65.99

400 mg (30): $125.00

Mechanism of ActionOfloxacin is a DNA gyrase inhibitor. DNA gyrase is an essential bacterial enzyme that maintains the superhelical structure of DNA. DNA gyrase is required for DNA replication and transcription, DNA repair, recombination, and transposition; bactericidal

Pharmacodynamics/Kinetics

Absorption: Well absorbed; food causes only minor alterations

Distribution: V_d: 2.4-3.5 L/kg

Protein binding: 32%

Bioavailability: Oral: 98%

Half-life elimination: Biphasic: 4-5 hours and 20-25 hours (accounts for <5%); prolonged with renal impairment

Excretion: Primarily urine (as unchanged drug)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and abnormal taste.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness, dizziness, nervousness, or insomnia; quinolones reported to cause restlessness, hallucinations, euphoria, depression, panic, and paranoia

Mental Health: Effects on Psychiatric TreatmentInhibits CYP1A2 isoenzyme; use caution with clozapine and other psychotropics; monitor for adverse effects

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Antipsychotics (Conventional and Atypical): Association With an Increased Risk of Mortality in Elderly Patients Treated for Dementia-Related Psychosis - June 2008

The Food and Drug Administration (FDA) is notifying healthcare professionals that conventional antipsychotics (eg, haloperidol, fluphenazine) will now carry a similar boxed warning as atypical antipsychotics (eg, risperidone, aripiprazole) concerning an increased risk of mortality in elderly patients treated for dementia-related psychosis. Atypical antipsychotics received the boxed warning in April 2005 after study data from seven placebo-controlled trials indicated an increased risk of death in patients treated with certain atypicals for dementia-related behavioral disorders.

The FDA requirement to extend the warning to conventional antipsychotics was prompted by two recently published observational studies. Both studies revealed an increased risk of mortality in elderly patients treated with these medications. One of the two studies was a retrospective cohort study which examined 37,241 patients, ≥65 years of age, treated with antipsychotics. Of these patients, 12,882 received a conventional antipsychotic compared to 24,359 patients who received an atypical antipsychotic. All-cause mortality within the first 180 days of use was compared between the two groups. The results showed that the risk of death in patients who received a conventional-type antipsychotic was comparable to (and may be greater than) the risk of death in patients receiving an atypical. The second study was also a retrospective cohort study; it involved 27,259 matched pairs of patients, ≥66 years of age, diagnosed with dementia. Risk of death was compared in patients who received an atypical antipsychotic versus no antipsychotic, and in patients who received a conventional antipsychotic versus an atypical antipsychotic. An increased risk of death was observed in the groups receiving an atypical antipsychotic compared to no antipsychotic and also in patients receiving a conventional antipsychotic compared to patients receiving an atypical antipsychotic. This effect was seen at 30 days and persisted at 180 days, and was seen in both community-dwelling and long-term care facility patients.

The FDA believes that considering all the available evidence, conventional antipsychotics at least share a similar increased risk of death that has been observed with the use of atypical antipsychotics in elderly patients with dementia-related psychosis. The FDA is reminding practitioners that antipsychotic medications are not approved for the treatment of dementia-related psychosis. Elderly patients treated with antipsychotics, conventional or atypical, are at an increased risk of death. Practitioners prescribing antipsychotics to elderly patients for this purpose should inform the patient and their caregivers of this risk prior to prescribing.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antipsychotics

Pronunciation(oh LAN za peen & floo OKS e teen)

U.S. Brand NamesSymbyax®

Pharmacologic CategoryAntidepressant, Selective Serotonin Reuptake Inhibitor; Antipsychotic Agent, Atypical

Use: Labeled IndicationsTreatment of depressive episodes associated with bipolar disorder

Dosing: Adults**Depression associated with bipolar disorder:** Oral: Initial: Olanzapine 3-6 mg/fluoxetine 25 mg once daily in the evening. Dosing range: Olanzapine 6-12 mg/fluoxetine 25-50 mg. Lower doses (olanzapine 3 mg/fluoxetine 25 mg) should be used in patients predisposed to hypotension, in hepatic impairment, with combined factors for reduced metabolism (females, the elderly, nonsmokers), or enhanced sensitivity to olanzapine; use caution in dose adjustments in these patients. Safety of daily doses of olanzapine >18 mg/fluoxetine >75 mg have not been evaluated.

Dosing: ElderlyOral: Initial: Olanzapine 3-6 mg/fluoxetine 25 mg once daily in the evening; use caution adjusting dose (metabolism may be decreased). Safety and efficacy have not been established in patients >65 years of age.

Dosing: Hepatic ImpairmentInitial: Olanzapine 6 mg/fluoxetine 25 mg once daily in the evening; use caution adjusting dose (metabolism may be decreased).

Administration: OralCapsules should be taken once daily in the evening. May be taken with or without food.

Dietary ConsiderationsMay be taken with or without food.

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F). Protect from moisture.

RestrictionsAn FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.

ContraindicationsHypersensitivity to olanzapine, fluoxetine, or any component of the formulation; patients currently receiving MAO inhibitors, thioridazine, pimozide, or mesoridazine; treatment within 14 days of MAO therapy

Allergy Considerations

- OLANZapine Allergy
- Selective Serotonin Reuptake Inhibitor (SSRI) Allergy

Warnings/Precautions

Boxed warnings:

- Dementia: See “Disease-related concerns” below.

- Suicidal thinking/behavior: See “Major psychiatric warnings” below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor patients for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 months of therapy or during periods of dosage adjustments (increases or decreases); the patient’s family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants should be dispensed with each prescription. **This combination is not FDA approved for use in children.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **This combination is FDA approved for the treatment of depressive episodes associated with bipolar disorder.**

Concerns related to adverse effects:

- Allergic events and rash: Fluoxetine use has been associated with occurrences of significant rash and allergic events, including vasculitis, lupus-like syndrome, laryngospasm, anaphylactoid reactions, and pulmonary inflammatory disease.

- Altered cardiac conduction: May alter cardiac conduction; life-threatening arrhythmias have occurred with therapeutic doses of antipsychotics.

- Anticholinergic effects: Olanzapine may cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, urinary retention, BPH, xerostomia, or visual problems. Relative to other neuroleptics, olanzapine has a moderate potency of cholinergic blockade.

- Bleeding risk: May impair platelet aggregation resulting in increased risk of bleeding events, particularly if used concomitantly with aspirin, NSAIDs, warfarin or other anticoagulants. Bleeding related to SSRI use has been reported to range from relatively minor bruising and epistaxis to life-threatening hemorrhage.

- Esophageal dysmotility/Aspiration: Has been associated with antipsychotic use; use with caution in patients at risk of pneumonia (eg, Alzheimer’s disease).

- Extrapyramidal symptoms (EPS): May cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia (risk of these reactions is generally much lower relative to typical/conventional antipsychotics). Risk of dystonia (and probably other EPS) may be greater with increased doses, use of conventional antipsychotics, males, and younger patients.

- Hyperglycemia: Atypical antipsychotics have been associated with development of hyperglycemia; in some cases, may be extreme and associated with ketoacidosis, hyperosmolar coma, or death. Olanzapine may have a greater association with hyperglycemia than other atypical antipsychotics. Use with caution in patients with diabetes or other disorders of glucose regulation; monitor for worsening of glucose control. Patients with risk factors for diabetes (eg, obesity or family history) should have a baseline fasting blood sugar (FBS) and periodic assessment of glucose regulation.

- Neuroleptic malignant syndrome (NMS): Use may be associated with NMS; monitor for mental status changes, fever, muscle rigidity, and/or autonomic instability (risk may be increased in patients with Parkinson's disease or Lewy body dementia).

- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Sedation: Moderate to highly sedating, use with caution in disorders where CNS depression is a feature; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Sexual dysfunction: May cause or exacerbate sexual dysfunction.

- SIADH and hyponatremia: SSRIs and SNRIs have been associated with the development of SIADH; hyponatremia has been reported rarely (including severe cases with serum sodium <110 mmol/L), predominately in the elderly. Volume depletion and/or concurrent use of diuretics likely increases risk.

- Temperature regulation: Impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.

- Weight gain: Significant weight gain (>7% of baseline weight) has been observed with antipsychotic therapy; incidence varies with product. Monitor waist circumference and BMI.

Disease-related concerns:

- Dementia: **[U.S. Boxed Warning]: Elderly patients with dementia-related behavioral disorders treated with atypical antipsychotics are at an increased risk of death compared to placebo.** An increased incidence of cerebrovascular adverse events (including fatalities) has been reported in elderly patients with dementia-related psychosis. Olanzapine is not approved for this indication.

- Glaucoma: Use with caution in patients with narrow-angle glaucoma; condition may be exacerbated by cholinergic blockade. Screening is recommended. Relative to other neuroleptics, olanzapine has a moderate potency of cholinergic blockade.

- Hepatic impairment: Use with caution in patients with hepatic disease or impairment; lowest starting dose recommended.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; condition may be exacerbated by cholinergic blockade. Relative to other neuroleptics, olanzapine has a moderate potency of cholinergic blockade.

- Parkinson's disease: Use with caution in patients with Parkinson's disease; they may be more sensitive to adverse effects.

- Prolactin-dependent tumors: Use with caution in breast cancer or other prolactin-dependent tumors; elevates prolactin levels.

- Renal impairment: Use with caution in patients with renal disease; a lower dosage may be needed.

- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold. Elderly patients may be at increased risk of seizures due to an increased prevalence of predisposing factors.

Concurrent drug therapy issues:

- Anticoagulants/Antiplatelets: Use caution with concomitant use of NSAIDs, ASA, or other drugs that affect coagulation; the risk of bleeding may be potentiated.

- MAO inhibitors: Potential for severe reaction when used with MAO inhibitors; autonomic instability, coma, death, delirium, diaphoresis, hyperthermia, mental status changes/agitation, muscular rigidity, myoclonus, neuroleptic malignant syndrome features, and seizures may occur. MAO inhibitor therapy must be stopped for 14 days before olanzapine/fluoxetine is initiated. Treatment with MAO inhibitors, thioridazine, or mesoridazine should not be initiated until 5 weeks after the discontinuation of olanzapine/fluoxetine.

- Pimozide and thioridazine: Fluoxetine may elevate plasma levels of these agents; increasing risk of QTc interval prolongation; this may lead to serious ventricular arrhythmias such as torsade de pointes-type arrhythmias and sudden death. **Use is contraindicated.**

- Serotonin syndrome: Symptoms of agitation, confusion, hallucinations, hyper-reflexia, myoclonus, shivering, and tachycardia may occur with concomitant proserotonergic drugs (ie, SSRIs/SNRIs or triptans) or agents which reduce fluoxetine's metabolism. Concurrent use of serotonin precursors (eg, tryptophan) is not recommended.

Special populations:

- Elderly: Use caution in elderly patients; risk of hyponatremia and other adverse events may be increased. Safety and efficacy have not been established in patients >65 years of age.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Duration of therapy: Antidepressant efficacy with treatment >8 weeks duration has not been established.

- Electroconvulsive therapy: May increase the risks associated with electroconvulsive therapy; consider discontinuing, when possible, prior to ECT treatment.

- Long half-life: Due to the long half-life of fluoxetine and its metabolites, the effects and interactions noted may persist for prolonged periods following discontinuation.

- Withdrawal syndrome: May cause dysphoric mood, irritability, agitation, dizziness, sensory disturbances, anxiety, confusion, headache, lethargy, emotional lability, insomnia, hypomania, tinnitus, and seizures. Upon discontinuation of therapy, gradually taper dose. If intolerable symptoms occur following a decrease in dosage or upon discontinuation of therapy, then resuming the previous dose with a more gradual taper should be considered.

Pregnancy Risk FactorC
Pregnancy ConsiderationsA decrease in fetal weight, testicular degeneration and atrophy, depletion of epididymal sperm, and infertility in males was reported in some animal reproduction studies using this combination. Use during pregnancy is not recommended. Refer to individual agents for additional information.
LactationEnters breast milk/not recommended
Breast-Feeding ConsiderationsFluoxetine enters breast milk. AAP rates use during breast-feeding as “of concern.”
Adverse ReactionsAs reported with combination product (also see individual agents):

>10%:

Central nervous system: Somnolence (21% to 22%)

Gastrointestinal: Weight gain (17% to 21%), diarrhea (8% to 19%), appetite increased (13% to 16%), xerostomia (11% to 16%)

Neuromuscular & skeletal: Weakness (13% to 15%)

1% to 10%:

Cardiovascular: Peripheral edema (4% to 8%), edema (up to 5%), hypertension (2%), tachycardia (2%), vasodilation

Central nervous system: Thinking abnormal (6%), fever (3% to 4%), amnesia (1% to 3%), personality disorder (1% to 2%), sleep disorder (1% to 2%), speech disorder (up to 2%), chills, migraine

Dermatologic: Photosensitivity

Endocrine & metabolic: Ejaculation abnormal (2% to 7%), impotence (2% to 4%), libido decreased (2% to 4%), anorgasmia (1% to 3%), breast pain, menorrhagia

Gastrointestinal: Tooth disorder (1% to 2%), salivation increased, taste perversion, thirst, weight loss

Genitourinary: Urinary frequency, urinary incontinence, urinary tract infection

Neuromuscular & skeletal: Tremor (8% to 9%), twitching (2% to 6%), arthralgia (3% to 5%), hyperkinesias (1% to 2%), joint disorder (1% to 2%), bruising, neck pain/rigidity

Ocular: Amblyopia (4% to 5%), vision abnormal

Otic: Ear pain (1% to 2%), otitis media (up to 2%), tinnitus

Respiratory: Pharyngitis (4% to 6%), dyspnea (1% to 2%), bronchitis, lung disorder

Frequency not defined: Alkaline phosphate increased, cholesterol increased, GGT increased, hemoglobin decreased, prolactin increased, uric acid increased

Postmarketing (limited to significant or life-threatening): Acidosis, acute brain syndrome, anemia, angina pectoris, apnea, arrhythmia (various), asthma, ataxia, behavioral/personality changes (eg, hostility, emotional lability), bilirubinemia, bradycardia, breast carcinoma, bundle branch block, cellulitis, cerebral ischemia, cholelithiasis, coagulation disorder, colitis, coma, confusion, congestive heart failure, conjunctivitis, creatinine increased, deafness, dehydration, dystonia, emphysema, exfoliative dermatitis, extrapyramidal syndrome, eye hemorrhage, fatty liver, gastrointestinal hemorrhage, hematuria, hemoptysis, hepatomegaly, hyperkalemia, hyperlipemia, hyperprolactinemia, hyperventilation, hypoesthesia, hypoglycemia, hypokalemia, hyponatremia, hypokinesia, hypotension, hypothyroidism, incontinence, intestinal obstruction, jaundice, kidney calculus, leukocytosis, leukopenia, liver damage (cholestatic or mixed), lymphadenopathy, maculopapular rash, menopause, menstrual disorders, myasthenia, myocardial infarct, myoclonus, myopathy, neoplasm, neuralgia, osteoporosis, ovarian disorder, pancreatitis, pelvic pain, peptic ulcer, periodontal abscess, peripheral vascular disorder, pneumonia, purpura, QT interval increased, rheumatoid arthritis, seizure, subarachnoid hemorrhage, suicide attempt, tendinous contracture, tenosynovitis, thrombocythemia, transaminases increased, T-wave inverted, urination impaired, uterine fibroids enlarged, vesiculobullous rash, withdrawal syndrome

Drug Interactions

Acetylcholinesterase Inhibitors (Central): May enhance the neurotoxic (central) effect of Antipsychotics. Severe extrapyramidal symptoms have occurred in some patients. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Alpha-/Beta-Blockers: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Alpha-/Beta-Blockers. *Risk C: Monitor therapy*

Amphetamines: Antipsychotics may diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Analgesics (Opioid): May enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Anticoagulants: Antiplatelet Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Serotonin Reuptake Inhibitor/Antagonist): Selective Serotonin Reuptake Inhibitors may enhance the serotonergic effect of Antidepressants (Serotonin Reuptake Inhibitor/Antagonist). This may cause serotonin syndrome. *Risk C: Monitor therapy*

Anti-Parkinson's Agents (Dopamine Agonist): Antipsychotics (Atypical) may diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Antiplatelet Agents: May enhance the anticoagulant effect of other Antiplatelet Agents. *Risk C: Monitor therapy*

Aspirin: Selective Serotonin Reuptake Inhibitors may enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Beta-Blockers: Selective Serotonin Reuptake Inhibitors may enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Acebutolol; Atenolol;

Carteolol; Esmolol; Levobunolol; Metipranolol; Nadolol; Penbutolol. *Risk C: Monitor therapy*

BusPIRone: May enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. Selective Serotonin Reuptake Inhibitors may decrease the metabolism of BusPIRone. *Risk C: Monitor therapy*

CarBAMazepine: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of CarBAMazepine. Specifically those SSRIs that inhibit CYP3A4 isoenzymes. CarBAMazepine may increase the metabolism of Selective Serotonin Reuptake Inhibitors. Specifically those agents metabolized via CYP1A2, 2C, and/or 3A4 isoenzymes. *Risk D: Consider therapy modification*

Cimetidine: May decrease the metabolism of Selective Serotonin Reuptake Inhibitors. *Risk D: Consider therapy modification*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Clozapine: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Clozapine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP1A2 Substrates: CYP1A2 Inhibitors (Moderate) may decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP2C19 Substrates: CYP2C19 Inhibitors (Moderate) may decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Substrates: CYP2D6 Inhibitors (Strong) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk D: Consider therapy modification*

Cyproheptadine: May diminish the therapeutic effect of Selective Serotonin Reuptake Inhibitors. *Risk C: Monitor therapy*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Desmopressin: Selective Serotonin Reuptake Inhibitors may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Dextromethorphan: Selective Serotonin Reuptake Inhibitors may enhance the adverse/toxic effect of Dextromethorphan. *Risk D: Consider therapy modification*

Drotrecogin Alfa: Antiplatelet Agents may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Fluvoxamine: May decrease the metabolism of OLANZapine. *Risk D: Consider therapy modification*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Galantamine: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Galantamine. *Risk C: Monitor therapy*

Haloperidol: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Haloperidol. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Antiplatelet Agents. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Iobenguane I 123: Selective Serotonin Reuptake Inhibitors may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

LamoTRIgine: May enhance the sedative effect of OLANZapine. *Risk C: Monitor therapy*

Lithium: Selective Serotonin Reuptake Inhibitors may enhance the adverse/toxic effect of Lithium. *Risk C: Monitor therapy*

Lithium formulations: May enhance the neurotoxic effect of Antipsychotics. Lithium formulations may decrease the serum concentration of Antipsychotics. Specifically noted with chlorpromazine. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Selective Serotonin Reuptake Inhibitors. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk X: Avoid combination*

Methadone: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Methadone. Fluvoxamine appears to be the only interacting SSRI. *Risk D: Consider therapy modification*

Mexiletine: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Mexiletine. *Risk D: Consider therapy modification*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

NSAID (COX-2 Inhibitor): Selective Serotonin Reuptake Inhibitors may enhance the antiplatelet effect of NSAID (COX-2 Inhibitor). *Risk D: Consider therapy modification*

NSAID (Nonselective): Selective Serotonin Reuptake Inhibitors may enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Omega-3-Acid Ethyl Esters: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

Phenytoin: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Pimozide: Selective Serotonin Reuptake Inhibitors may enhance the adverse/toxic effect of Pimozide. *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Propafenone: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Propafenone. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

QuiNIDine: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of QuiNIDine. Fluvoxamine appears to be the only SSRI of concern. *Risk D: Consider therapy modification*

Risperidone: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Risperidone. *Risk C: Monitor therapy*

Salicylates: Antiplatelet Agents may enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Tamoxifen: CYP2D6 Inhibitors (Strong) may decrease the metabolism of Tamoxifen. Specifically, strong CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk X: Avoid combination*

Tetrabenazine: May enhance the adverse/toxic effect of Antipsychotics. *Risk C: Monitor therapy*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

Thrombolytic Agents: Antiplatelet Agents may enhance the anticoagulant effect of Thrombolytic Agents. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

TraMADol: Selective Serotonin Reuptake Inhibitors may enhance the neuroexcitatory and/or seizure-potentiating effect of TraMADol. TraMADol may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Tryptophan: May enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Selective Serotonin Reuptake Inhibitors may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsSee individual agents.

Monitoring ParametersVital signs; lipid profile, fasting blood glucose/Hgb A_{1c}; BMI; mental status; abnormal involuntary movement scale (AIMS), extrapyramidal symptoms (EPS); signs and symptoms of depression, anxiety, suicidal ideation (especially at the beginning of therapy or when doses are increased or decreased), sleep; liver function tests in patients with hepatic disease

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsLipid profile, fasting blood glucose/Hgb A_{1c}; BMI

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

- Symbyax® 3/25: Olanzapine 3 mg and fluoxetine 25 mg
- Symbyax® 6/25: Olanzapine 6 mg and fluoxetine 25 mg
- Symbyax® 6/50: Olanzapine 6 mg and fluoxetine 50 mg
- Symbyax® 12/25: Olanzapine 12 mg and fluoxetine 25 mg
- Symbyax® 12/50: Olanzapine 12 mg and fluoxetine 50 mg

Generic AvailableNo

- 6-50 mg (30): $389.68
- 12-25 mg (30): $496.76
- 12-50 mg (30): $470.72

Mechanism of ActionOlanzapine is a second generation thienobenzodiazepine antipsychotic which displays potent antagonism of serotonin 5-HT$_{2A}$ and 5-HT$_{2C}$, dopamine D$_{1-4}$, histamine H$_1$ and alpha$_1$-adrenergic receptors. Olanzapine shows moderate antagonism of 5-HT$_3$ and muscarinic M$_{1-5}$ receptors, and weak binding to GABA-A, BZD, and beta-adrenergic receptors. Fluoxetine inhibits CNS neuron serotonin reuptake; minimal or no effect on reuptake of norepinephrine or dopamine; does not significantly bind to alpha-adrenergic, histamine, or cholinergic receptors. The enhanced antidepressant effect of the combination may be due to synergistic increases in serotonin, norepinephrine, and dopamine.

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Agents Approved for Bipolar Disorder
- FLUoxetine
- OLANZapine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia or salivation increased (normal salivary flow resumes upon discontinuation), tooth disorder, and taste perversion.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health CommentA small trial has demonstrated the olanzapine and fluoxetine combination formulation to be efficacious for the treatment of bipolar depression. However, in the clinical setting, this fixed-drug combination is uncommonly used due to inability to titrate individual components.

In 2008, the FDA issued a warning regarding increased mortality risk with typical **and** atypical antipsychotic drugs when used in elderly patients with dementia-related psychosis.

Index TermsFluoxetine and Olanzapine; Olanzapine and Fluoxetine Hydrochloride

Special Alerts

Antipsychotics (Conventional and Atypical): Association With an Increased Risk of Mortality in Elderly Patients Treated for Dementia-Related Psychosis - June 2008

The Food and Drug Administration (FDA) is notifying healthcare professionals that conventional antipsychotics (eg, haloperidol, fluphenazine) will now carry a similar boxed warning as atypical antipsychotics (eg, risperidone, aripiprazole) concerning an increased risk of mortality in elderly patients treated for dementia-related psychosis. Atypical antipsychotics received the boxed warning in April 2005 after study data from seven placebo-controlled trials indicated an increased risk of death in patients treated with certain atypicals for dementia-related behavioral disorders.

The FDA requirement to extend the warning to conventional antipsychotics was prompted by two recently published observational studies. Both studies revealed an increased risk of mortality in elderly patients treated with these medications. One of the two studies was a retrospective cohort study which examined 37,241 patients, ≥65 years of age, treated with antipsychotics. Of these patients, 12,882 received a conventional antipsychotic compared to 24,359 patients who received an atypical antipsychotic. All-cause mortality within the first 180 days of use was compared between the two groups. The results showed that the risk of death in patients who received a conventional-type antipsychotic was comparable to (and may be greater than) the risk of death in patients receiving an atypical. The second study was also a retrospective cohort study; it involved 27,259 matched pairs of patients, ≥66 years of age, diagnosed with dementia. Risk of death was compared in patients who received an atypical antipsychotic versus no antipsychotic, and in patients who received a conventional antipsychotic versus an atypical antipsychotic. An increased risk of death was observed in the groups receiving an atypical antipsychotic compared to no antipsychotic and also in patients receiving a conventional antipsychotic compared to patients receiving an atypical antipsychotic. This effect was seen at 30 days and persisted at 180 days, and was seen in both community-dwelling and long-term care facility patients.

The FDA believes that considering all the available evidence, conventional antipsychotics at least share a similar increased risk of death that has been observed with the use of atypical antipsychotics in elderly patients with dementia-related psychosis. The FDA is reminding practitioners that antipsychotic medications are not approved for the treatment of dementia-related psychosis. Elderly patients treated with antipsychotics, conventional or atypical, are at an increased risk of death. Practitioners prescribing antipsychotics to elderly patients for this purpose should inform the patient and their caregivers of this risk prior to prescribing.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antipsychotics

Medication Safety Issues

Sound-alike/look-alike issues:

OLANZapine may be confused with olsalazine, QUEtiapine

Zyprexa® may be confused with Celexa™, Zyrtec®

Pronunciation(oh LAN za peen)

U.S. Brand NamesZyprexa®; Zyprexa® Zydis®

Canadian Brand NamesNovo-Olanzapine; Zyprexa®; Zyprexa® Zydis®

Pharmacologic CategoryAntimanic Agent; Antipsychotic Agent, Atypical

Use: Labeled IndicationsTreatment of the manifestations of schizophrenia; treatment of acute or mixed mania episodes associated with Bipolar I Disorder (as monotherapy or in combination with lithium or valproate); maintenance treatment of bipolar disorder; acute agitation (patients with schizophrenia or bipolar mania)

Use: Unlabeled/InvestigationalTreatment of psychosis/schizophrenia in children or adolescents; chronic pain; prevention of chemotherapy-associated delayed nausea or vomiting; psychosis/agitation related to Alzheimer's dementia

Dosing: Adults

Schizophrenia: Initial: 5-10 mg once daily (increase to 10 mg once daily within 5-7 days); thereafter, adjust by 5 mg/day at 1-week intervals, up to a recommended maximum of 20 mg/day. Maintenance: 10-20 mg once daily. **Note:** Doses of 30-50 mg/day have been used; however, doses >10 mg/day have not demonstrated better efficacy, and safety and efficacy of doses >20 mg/day have not been evaluated.

Acute mania associated with bipolar disorder: Oral:

Monotherapy: Initial: 10-15 mg once daily; increase by 5 mg/day at intervals of not less than 24 hours. Maintenance: 5-20 mg/day; recommended maximum dose: 20 mg/day.

Combination therapy (with lithium or valproate): Initial: 10 mg once daily; dosing range: 5-20 mg/day

Agitation (acute, associated with bipolar disorder or schizophrenia): I.M.: Initial dose: 5-10 mg (a lower dose of 2.5 mg may be considered when clinical factors warrant); additional doses (2.5-10 mg) may be considered; however, 2-4 hours should be allowed between doses to evaluate response (maximum total daily dose: 30 mg, per manufacturer's recommendation)

Prevention of chemotherapy-associated delayed nausea or vomiting (unlabeled use; in combination with a corticosteroid and serotonin [$5HT_3$] antagonist): Oral: 10 mg once daily for 3-5 days, beginning on day 1 of chemotherapy **or** 5 mg once daily for 2 days before chemotherapy, followed by 10 mg once daily (beginning on the day of chemotherapy) for 3-8 days

Dosing: ElderlyRefer to adult dosing. Consider lower starting dose of 2.5-5 mg/day for elderly or debilitated patients; may increase as clinically indicated and tolerated with close monitoring of orthostatic blood pressure.

Psychosis/agitation related to Alzheimer's dementia (unlabeled use): Initial: 1.25-5 mg/day; if necessary, gradually increase as tolerated not to exceed 10 mg/day

Dosing: Pediatric**Schizophrenia/bipolar disorder (unlabeled use):** Oral: Initial: 2.5 mg/day; titrate as necessary to 20 mg/day (0.12-0.29 mg/kg/day)

Dosing: Renal ImpairmentNo dosage adjustment required. Not removed by dialysis.

Dosing: Hepatic ImpairmentDosage adjustment may be necessary, however, there are no specific recommendations. Monitor closely.

Administration: I.M.Injection: For I.M. administration only; inject slowly, deep into muscle. If dizziness and/or drowsiness are noted, patient should remain recumbent until examination indicates postural hypotension and/or bradycardia are not a problem. Concurrent use of I.M./I.V. benzodiazepines is not recommended (fatalities have been reported, though causality not determined).

Administration: I.V.Do not administer injection intravenously.

Administration: Oral

Tablet: May be administered with or without food.

Orally-disintegrating tablet: Remove from foil blister by peeling back (do not push tablet through the foil). Place tablet in mouth immediately upon removal. Tablet dissolves rapidly in saliva and may be swallowed with or without liquid. May be administered with or without food/meals.

Dietary ConsiderationsTablets may be taken with or without food. Zyprexa® Zydis®: 5 mg tablet contains phenylalanine 0.34 mg; 10 mg tablet contains phenylalanine 0.45 mg; 15 mg tablet contains phenylalanine 0.67 mg; 20 mg tablet contains phenylalanine 0.9 mg.

Storage

Injection, powder for reconstitution: Store at room temperature 15°C to 30°C (59°F to 86°F); do not freeze. Protect from light.

Tablet and orally-disintegrating tablet: Store at room temperature of 15°C to 30°C (59°F to 86°F). Protect from light and moisture.

ReconstitutionInjection, powder for reconstitution: Reconstitute 10 mg vial with 2.1 mL SWFI. Resulting solution is ~5 mg/mL. Use immediately (within 1 hour) following reconstitution. Discard any unused portion.

ContraindicationsHypersensitivity to olanzapine or any component of the formulation

Allergy Considerations

- OLANZapine Allergy

Warnings/Precautions

Boxed warnings:

- Dementia: See "Disease-related concerns" below.

Concerns related to adverse effects:

- Altered cardiac conduction: May alter cardiac conduction; life-threatening arrhythmias have occurred with therapeutic doses of antipsychotics.

- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems. Relative to other neuroleptics, olanzapine has a moderate potency of cholinergic blockade.

- Esophageal dysmotility/aspiration: Antipsychotic use has been associated with esophageal dysmotility and aspiration; use with caution in patients at risk of pneumonia (ie, Alzheimer's disease).

- Extrapyramidal symptoms (EPS): May cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia (risk of these reactions is generally much lower relative to typical/conventional antipsychotics). Risk of dystonia (and probably other EPS) may be greater with increased doses, use of conventional antipsychotics, males, and younger patients.

- Hyperglycemia: Atypical antipsychotics have been associated with development of hyperglycemia; in some cases, may be extreme and associated with ketoacidosis, hyperosmolar coma, or death. Olanzapine may have a greater association with hyperglycemia than other atypical antipsychotics. Use with caution in patients with diabetes or other disorders of glucose regulation; monitor for worsening of glucose control. Patients with risk factors for diabetes (eg, obesity or family history) should have a baseline fasting blood sugar (FBS) and periodic assessment of glucose regulation.

- Neuroleptic malignant syndrome (NMS): Use may be associated with NMS; monitor for mental status changes, fever, muscle rigidity, and/or autonomic instability (risk may be increased in patients with Parkinson's disease or Lewy body dementia).
- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).
- Sedation: May be moderate to highly sedating, use with caution in disorders where CNS depression is a feature; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Suicidal ideation: The possibility of a suicide attempt is inherent in psychotic illness or bipolar disorder; use with caution in high-risk patients during initiation of therapy. Prescriptions should be written for the smallest quantity consistent with good patient care.
- Temperature regulation: Impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.
- Weight gain: Significant weight gain (>7% of baseline weight) has been observed with antipsychotic therapy; incidence varies with product. Monitor waist circumference and BMI.

Disease-related concerns:

- Dementia: **[U.S. Boxed Warning]: Elderly patients with dementia-related psychosis treated with atypical antipsychotics are at an increased risk of death compared to placebo.** An increased incidence of cerebrovascular adverse events (including fatalities) has been reported in elderly patients with dementia-related psychosis. Olanzapine is not approved for this indication.
- Glaucoma: Use with caution in patients with narrow-angle glaucoma; condition may be exacerbated by cholinergic blockade. Screening is recommended.
- Hepatic impairment: Use with caution in patients with hepatic disease or impairment.
- Myasthenia gravis: Use with caution in patients with myasthenia gravis; condition may be exacerbated by cholinergic blockade.
- Parkinson's disease: Use with caution in patients with Parkinson's disease; they may be more sensitive to adverse effects.
- Prolactin-dependent tumors: Use with caution in patients with breast cancer or other prolactin-dependent tumors; elevates prolactin levels.
- Renal impairment: Use with caution in patients with renal disease.
- Seizures: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold. Elderly patients may be at increased risk of seizures due to an increased prevalence of predisposing factors.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.
- Smokers: Olanzapine levels may be lower in patients who smoke, requiring dosage adjustment.

Dosage form-specific concerns:

- Intramuscular administration: Patients should remain recumbent if drowsy/dizzy until hypotension, bradycardia, and/or hypoventilation has been ruled out. Concurrent use of I.M./I.V. benzodiazepines is not recommended (fatalities have been reported, though causality not determined).

Geriatric ConsiderationsElderly patients have an increased risk of adverse response to side effects or adverse reactions to antipsychotics. A higher incidence of falls has been reported in elderly patients, particularly in debilitated patients. Olanzapine half-life that was 1.5 times that of younger (<65 years of age) adults; therefore, lower initial doses are recommended. Olanzapine is not indicated in dementia-related psychosis.

Studies with patients ≥65 years of age with schizophrenia showed no difference in tolerability compared to younger adults. Studies in the elderly with dementia-related psychosis suggested a different tolerability compared to younger patients with schizophrenia. In light of significant risks and adverse effects in the elderly population (compared with limited data demonstrating efficacy in the treatment of dementia-related psychosis, aggression, and agitation), an extensive risk:benefit analysis should be performed prior to use. Therefore, use with caution and at lower recommended doses.

Pregnancy Risk FactorC

Pregnancy ConsiderationsNo evidence of teratogenicity reported in animal studies. However, fetal toxicity and prolonged gestation have been observed. There are no adequate and well-controlled studies in pregnant women. Healthcare providers are encouraged to enroll women 18-45 years of age exposed to olanzapine during pregnancy in the Atypical Antipsychotics Pregnancy Registry (1-866-961-2388).

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsAt steady-state concentrations, it is estimated that a breast-fed infant may be exposed to ~2% of the maternal dose.

Adverse Reactions

>10%:

Central nervous system: Somnolence (6% to 39% dose dependent), extrapyramidal symptoms (15% to 32% dose dependent), insomnia (up to 12%), dizziness (4% to 18%)

Gastrointestinal: Dyspepsia (7% to 11%), constipation (9% to 11%), weight gain (5% to 6%, has been reported as high as 40%), xerostomia (9% to 22% dose dependent)

Neuromuscular & skeletal: Weakness (2% to 20% dose dependent)

Miscellaneous: Accidental injury (12%)

1% to 10%:

Cardiovascular: Postural hypotension (1% to 5%), tachycardia (up to 3%), peripheral edema (up to 3%), chest pain (up to 3%), hyper-/hypotension (up to 2%)

Central nervous system: Personality changes (8%), speech disorder (7%), fever (up to 6%), abnormal dreams, euphoria, amnesia, delusions, emotional lability, mania, schizophrenia

Dermatologic: Bruising (up to 5%)

Endocrine & metabolic: Cholesterol increased (4%), prolactin increased

Gastrointestinal: Nausea (up to 9% dose dependent), appetite increased (3% to 6%), vomiting (up to 4%), flatulence, salivation increased, thirst

Genitourinary: Incontinence (up to 2%), UTI (up to 2%), vaginitis

Hepatic: ALT increased (2%)

Local: Injection site pain (I.M. administration)

Neuromuscular & skeletal: Tremor (1% to 7% dose dependent), abnormal gait (6%), back pain (up to 5%), joint/extremity pain (up to 5%), akathisia (3% to 5% dose dependent), hypertonia (up to 3%), articulation impairment (up to 2%), falling (particularly in older patients), joint stiffness, paresthesia, twitching

Ocular: Amblyopia (up to 3%), conjunctivitis

Respiratory: Rhinitis (up to 7%), cough (up to 6%), pharyngitis (up to 4%), dyspnea

Miscellaneous: Dental pain, diaphoresis, flu-like syndrome

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Acidosis, akinesia, albuminuria, anaphylactoid reaction, anemia, angioedema, apnea, arteritis, asthma, ataxia, atelectasis, atrial fibrillation, AV block, cerebrovascular accident, coma, confusion, congestive heart failure, deafness, diabetes mellitus, diabetic acidosis, diabetic coma, dyskinesia, dysphagia, dystonia, dysuria, encephalopathy, facial paralysis, glaucoma, gynecomastia, heart arrest, heart block, heart failure, hematuria, hemoptysis, hemorrhage (eye, rectal, subarachnoid, vaginal), hepatitis, hyper-/hypoglycemia, hyper-/hypokalemia, hyperlipemia, hyper-/hyponatremia, hyperuricemia, hyper-/hypoventilation, hypoesthesia, hypokinesia, hypoproteinemia, hypoxia, jaundice, ileus, ketosis, leukocytosis (eosinophilia), leukopenia, liver damage (cholestatic or mixed), liver fatty deposit, lung edema, lymphadenopathy, menstrual irregularities, migraine, myasthenia, myopathy, neuralgia, neuroleptic malignant syndrome, neuropathy, neutropenia, osteoporosis, pancreatitis, paralysis, priapism, pulmonary embolus, rhabdomyolysis, seizure, stridor, sudden death, suicide attempt, syncope, tardive dyskinesia, thrombocythemia, thrombocytopenia, tongue edema, venous thrombotic events, vomiting, withdrawal syndrome

Metabolism/Transport Effects **Substrate** of CYP1A2 (major), 2D6 (minor); **Inhibits** CYP1A2 (weak), 2C9 (weak), 2C19 (weak), 2D6 (weak), 3A4 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): May enhance the neurotoxic (central) effect of Antipsychotics. Severe extrapyramidal symptoms have occurred in some patients. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: Antipsychotics may diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Anti-Parkinson's Agents (Dopamine Agonist): Antipsychotics (Atypical) may diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

Fluvoxamine: May decrease the metabolism of OLANZapine. *Risk D: Consider therapy modification*

LamoTRIgine: May enhance the sedative effect of OLANZapine. *Risk C: Monitor therapy*

Lithium formulations: May enhance the neurotoxic effect of Antipsychotics. Lithium formulations may decrease the serum concentration of Antipsychotics. Specifically noted with chlorpromazine. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Tetrabenazine: May enhance the adverse/toxic effect of Antipsychotics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid dong quai, St John's wort (may also cause photosensitization). Avoid kava kava, gotu kola, valerian, St John's wort (may increase CNS depression).

Monitoring ParametersVital signs; fasting lipid profile and fasting blood glucose/Hgb A_{1c} (prior to treatment, at 3 months, then annually); periodic assessment of hepatic transaminases (in patients with hepatic disease); BMI, personal/family history of obesity, waist circumference; orthostatic blood pressure; mental status, abnormal involuntary movement scale (AIMS), extrapyramidal symptoms (EPS). Weight should be assessed prior to treatment, at 4 weeks, 8 weeks, 12 weeks, and then at quarterly intervals. Consider titrating to a different antipsychotic agent for a weight gain ≥5% of the initial weight.

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Initiate at lower doses. Taper dosage slowly when discontinuing. Instruct patients with diabetes to monitor blood glucose levels closely (may cause hyperglycemia). Monitor therapeutic effectiveness, and adverse reactions at beginning of therapy and periodically with long-term use. Monitor weight prior to initiating therapy and at least monthly. Consider titrating to a different antipsychotic agent for a weight gain ≥ 5% of initial weight. Teach patient appropriate administration, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsFasting lipid profile and fasting blood glucose/Hgb A_{1c} (prior to treatment, at 3 months, then annually); periodic assessment of hepatic transaminases (in patients with hepatic disease)

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Use exactly as directed; do not increase dose or frequency. It may take 2-3 weeks to achieve desired results; do not discontinue without consulting prescriber. Avoid alcohol or caffeine and other prescription or OTC medications not approved by prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. If you have diabetes, you may experience increased blood sugars. Monitor blood sugars closely. If you have glaucoma, periodic ophthalmic exams are recommended. You may experience excess drowsiness, restlessness, weakness, dizziness, or blurred vision (use caution driving or when engaging in tasks requiring alertness until response to drug is known); postural hypotension (use caution when rising from lying or sitting position or climbing stairs); constipation (increased exercise, fluids, fruit, or fiber may help); heartburn; dry mouth; or weight gain. Report persistent CNS effects (eg, trembling fingers, altered gait or balance, excessive sedation, seizures, unusual movements, anxiety, abnormal thoughts, confusion, personality changes); suicidal ideation; unresolved constipation or GI effects; vision changes; respiratory difficulty; unusual cough or flu-like symptoms; or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Orally-disintegrating tablet: Remove from foil blister by peeling back (do not push tablet through the foil). Place tablet in mouth immediately upon removal. Tablet dissolves rapidly in saliva and may be swallowed with or without liquid.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution (Zyprexa® IntraMuscular): 10 mg [contains lactose 50 mg]

Tablet (Zyprexa®): 2.5 mg, 5 mg, 7.5 mg, 10 mg, 15 mg, 20 mg

Tablet, orally disintegrating (Zyprexa® Zydis®): 5 mg [contains phenylalanine 0.34 mg/tablet], 10 mg [contains phenylalanine 0.45 mg/tablet], 15 mg [contains phenylalanine 0.67 mg/tablet], 20 mg [contains phenylalanine 0.9 mg/tablet]

Mechanism of ActionOlanzapine is a second generation thienobenzodiazepine antipsychotic which displays potent antagonism of serotonin 5-HT_{2A} and 5-HT_{2C}, dopamine D_{1-4}, histamine H_1 and alpha$_1$-adrenergic receptors. Olanzapine shows moderate antagonism of 5-HT_3 and muscarinic M_{1-5} receptors, and weak binding to GABA-A, BZD, and beta-adrenergic receptors. Although the precise mechanism of action in schizophrenia and bipolar disorder is not known, the efficacy of olanzapine is thought to be mediated through combined antagonism of dopamine and serotonin type 2 receptor sites.

Pharmacodynamics/Kinetics

Absorption:

I.M.: Rapidly absorbed

Oral: Well absorbed; not affected by food; tablets and orally-disintegrating tablets are bioequivalent

Distribution: V_d: Extensive, 1000 L

Protein binding, plasma: 93% bound to albumin and alpha$_1$-glycoprotein

Metabolism: Highly metabolized via direct glucuronidation and cytochrome P450 mediated oxidation (CYP1A2, CYP2D6); 40% removed via first pass metabolism

Bioavailability: >57%

Half-life elimination: 21-54 hours; ~1.5 times greater in elderly

Time to peak, plasma: Maximum plasma concentrations after I.M. administration are 5 times higher than maximum plasma concentrations produced by an oral dose.

I.M.: 15-45 minutes

Oral: ~6 hours

Excretion: Urine (57%, 7% as unchanged drug); feces (30%)

Clearance: 40% increase in olanzapine clearance in smokers; 30% decrease in females

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Child/Adolescent ConsiderationsFive hospitalized children 6-11 years of age with varying diagnoses were treated with a mean daily dose of 7.5 mg/day (2.5-10 mg/day) or 0.22 mg/kg/day (0.12-0.29 mg/kg/day) for a mean of 32 days (Krishnamoorthy, 1998). Seven adolescents 12-17 years of age with DSM-IV bipolar disorder, manic episode were treated with a mean dose of 11 mg/day or 0.146 ± 0.086 mg/kg/day (Soutullo, 1999).

Soutullo CA, Sorter MT, Foster KD, et al, "Olanzapine in the Treatment of Adolescent Acute Mania: A Report of Seven Cases," *J Affect Disord*, 1999, 53(3):279-83.

Schizophrenia: Olanzapine has shown modest efficacy in pediatric schizophrenia, although treatment effects appear inferior to clozapine. However, the more favorable safety profile (compared to clozapine) may justify its continued use in this patient population.

In an open-label, single-arm pilot study, 8 children/adolescents (mean age: 15.3 years) diagnosed with childhood-onset schizophrenia (DSM-III-R) that was refractory to two prior typical neuroleptic regimens were evaluated for efficacy on olanzapine therapy for 8 weeks (Kumra, 1998). Rating instruments included the CGI, SANS, SAPS, and BPRS scales. In a separate study, a cohort of 15 children who received clozapine for 6 weeks was used as a comparative control group. Overall, olanzapine was well tolerated and did not cause any hematologic, EEG, or epileptogenic adverse effects, whereas 4 patients on clozapine required prophylactic anticonvulsant treatment. Body weight increases did not differ significantly between groups. Olanzapine dosing was initiated at 2.5 mg every other day (<40 kg) or every day (>40 kg), and titrated every 5-9 days by 2.5-5 mg up to a maximum of 20 mg/day. By the 6th week of treatment, the mean daily olanzapine dose was 17.5 mg (range: 12.5-20 mg) or 0.27 mg/kg. After 8 weeks of treatment, improvements relative to baseline were noted in each of the rating scales, ranging from 6% to 33%. However, the magnitude of response as measured by these scales was approximately threefold lower than the improvements seen with clozapine (using the same instruments) at the 6-week mark. Further, none of the olanzapine treated patients were rated as responders (based on standard criteria) at 6 weeks of therapy, and only 3 (38%) were responsive or partially responsive at 8 weeks. In comparison, 8 (53%) of clozapine-receiving patients were considered responders at the 6-week time point.

A double-blind, randomized, 8 week trial of olanzapine compared to clozapine was conducted in children/adolescents aged 7-16 years who met DSM-IV criteria for treatment-refractory schizophrenia (Shaw, 2006). The primary outcome measures were the CGI-S and SANS/SAPS scales. Patients randomized to olanzapine (n=13) were 12.8 years of age on average and received an average daily dose of 18.1 mg (20 mg/day maximum). Clozapine patients (n=12) were 11.7 years of age and received a mean daily dose of 387 mg (900 mg/day maximum). Side effects were reported more frequently in the clozapine arm (55 events) compared to the olanzapine arm (28 events, $p<0.001$), including significantly more cardiovascular events noted. Body weight increases and incidence of neutropenia did not differ significantly between groups. Relative to baseline antipsychotic-free scores, patients receiving clozapine showed improvements in the assessment scales of 23% to 48%, compared to 15% to 29% for olanzapine treated patients. Based on differential treatment effects, this equated to a 2.5-fold greater treatment effect in the clozapine arm.

Kumra S, Jacobsen LK, Lenane M, et al, "Childhood-Onset Schizophrenia: An Open-Label Study of Olanzapine in Adolescents," *J Am Acad Child Adolesc Psychiatry*, 1998, 37(4):377-85.

Mental Health Comment Olanzapine is an antipsychotic agent of a class often referred to as atypical. It should be noted that the definition of the term “atypical” is not universally agreed upon. Some prefer to describe antipsychotics based on their pharmacological properties. A common feature of all definitions used to describe “atypical” antipsychotics is the lack of significant acute or subacute EPS, at dosages generally associated with antipsychotic actions. Other experts have included definitions of atypicality that include a) failure to increase serum prolactin levels; b) superior efficacy for positive, negative, and cognitive symptoms; and c) lack of evidence of tardive dyskinesia or dystonia following chronic administration. Olanzapine meets most of these criteria, but is associated with dose-dependent EPS. Fortunately, if doses are kept within the approved dosage range (5-20 mg/day), EPS is low.

Tardive dyskinesia (TD) secondary to **typical** antipsychotics has an estimated incidence of 3% to 5% per year for the first 5 years of treatment. The incidence of TD associated with the atypical antipsychotics is estimated to be 0.5% to 1%. It is not clear if this estimate represents a risk associated with mental illness or to what extent drug therapy can be implicated. Atypical antipsychotics appear less likely to cause tardive dyskinesia than typical antipsychotics (fluphenazine, haloperidol).

Coadministration of two or more antipsychotics does not generally improve clinical response and may increase the potential for adverse effects.

In 2008, the FDA issued a warning regarding increased mortality risk with typical **and** atypical antipsychotic drugs when used in elderly patients with dementia-related psychosis.

Pronunciation(ole me SAR tan & hye droe klor oh THYE a zide)

U.S. Brand NamesBenicar HCT®

Canadian Brand NamesOlmetec Plus®

Pharmacologic CategoryAngiotensin II Receptor Blocker; Diuretic, Thiazide

Use: Labeled IndicationsTreatment of hypertension (not recommended for initial treatment)

Dosing: Adults

Hypertension: Oral: Dosage must be individualized; may be titrated at 2- to 4-week intervals.

Replacement therapy: May be substituted for titrated components.

Patients not controlled with single-agent therapy: Initiate by adding the lowest available dose of the alternative component (hydrochlorothiazide 12.5 mg or olmesartan 20 mg). Titrate to effect (maximum hydrochlorothiazide dose: 25 mg, maximum olmesartan dose: 40 mg).

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNot recommended in patients with Cl_{cr} <30 mL/minute.

Calculations

- Creatinine Clearance: Adults

StorageStore at 20°C to 25°C (68°F to 77°F).

ContraindicationsHypersensitivity to olmesartan, hydrochlorothiazide, or any component of the formulation; sulfonamide-derived drugs; anuria

Allergy Considerations

- Angiotensin Receptor Antagonist Allergy/Hypersensitivity
- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Electrolyte disturbances: Hyperkalemia may occur with angiotensin II receptor antagonists; risk factors include renal dysfunction, diabetes mellitus, and concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely. Thiazide diuretics may cause hypokalemia, hypochloremic alkalosis, hypomagnesemia, and hyponatremia.

- Photosensitivity: Photosensitization may occur.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Aortic/mitral stenosis: Use with caution in patients with significant aortic/mitral stenosis.

- Diabetes: Use hydrochlorothiazide with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.

- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated by hydrochlorothiazide.

- Hepatic impairment: Use caution in patients with severe hepatic impairment; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.

- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations; increased cholesterol and triglyceride levels have been reported with thiazides.

- Hypovolemia: Avoid use or use a smaller dose in patients who are volume depleted; correct depletion first.

- Renal artery stenosis: Use olmesartan with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use olmesartan with caution with pre-existing renal insufficiency and severe renal impairment. Avoid hydrochlorothiazide in severe renal disease (ineffective); may precipitate azotemia; discontinue or consider withholding if renal impairment occurs.

- Systemic lupus erythematosus (SLE): Hydrochlorothiazide can cause SLE exacerbation or activation.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, drugs that act on the angiotensin system can cause injury and death to the developing fetus when used in the second and third trimesters. Angiotensin receptor blockers should be discontinued as soon as possible once pregnancy is detected.**

Pregnancy Risk FactorC/D (2nd and 3rd trimesters)

Pregnancy ConsiderationsThe drug should be discontinued as soon as possible when pregnancy is detected. Drugs which act directly on renin-angiotensin can cause fetal and neonatal morbidity and death.

LactationExcretion in breast milk unknown/contraindicated

Adverse ReactionsFrequencies reported with combination product. See individual monographs for additional adverse effects reported with each agent.

Cardiovascular: Chest pain, peripheral edema

Central nervous system: Dizziness (9%), vertigo

Dermatologic: Rash

Endocrine & metabolic: Hyperuricemia (4%), hyperglycemia

Gastrointestinal: Nausea (3%), abdominal pain, dyspepsia, gastroenteritis, diarrhea

Genitourinary: Hematuria

Hepatic: Transaminases increased

Neuromuscular & skeletal: Back pain, arthritis, arthralgia, myalgia

Respiratory: Upper respiratory infection (7%), cough

Miscellaneous: CPK increased

Angioedema and rhabdomyolysis have been reported with angiotensin-receptor blockers. Severe dermatologic reactions, hypokalemia, and pancreatitis have been reported with hydrochlorothiazide.

Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

ACE Inhibitors: Angiotensin II Receptor Blockers may enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Eltrombopag: May increase the serum concentration of OATP1B1/SLCO1B1 Substrates. Management: According to eltrombopag prescribing information, consideration of a preventative dose reduction may be warranted. *Risk D: Consider therapy modification*

Eplerenone: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Lithium: Angiotensin II Receptor Blockers may increase the serum concentration of Lithium. Management: Lithium dosage reductions will likely be needed following the addition of an angiotensin II receptor antagonist. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: Angiotensin II Receptor Blockers may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Trimethoprim: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Monitoring ParametersBlood pressure; serum potassium
Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

20/12.5: Olmesartan medoxomil 20 mg and hydrochlorothiazide 12.5 mg

40/12.5: Olmesartan medoxomil 40 mg and hydrochlorothiazide 12.5 mg

40/25: Olmesartan medoxomil 40 mg and hydrochlorothiazide 25 mg

Generic AvailableNo
ManufacturerSankyo
Pricing: U.S. (www.drugstore.com)

Tablets (Benicar HCT)

20-12.5 mg (30): $78.51

40-12.5 mg (30): $86.71

40-25 mg (30): $96.34

Mechanism of ActionOlmesartan blocks the vasoconstrictor and aldosterone-secreting effects of angiotensin II. Hydrochlorothiazide inhibits sodium reabsorption in the distal tubules causing increased excretion of sodium and water as well as potassium and hydrogen ions.
Pharmacodynamics/KineticsSee individual agents.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness
Mental Health: Effects on Psychiatric TreatmentMay cause hyperglycemia and hypertriglyceridemia; combined use with psychotropics (atypical antipsychotics and mirtazapine) may produce additive effects. May cause diarrhea, these effects may be additive with concurrent use of SSRIs, lithium, or valproate. May cause flu-like symptoms, take this into consideration if also concerned about SSRI discontinuation syndrome. Combined use with lithium may produce lithium toxicity; monitor lithium levels.
Cardiovascular Considerations

Hypertension: According to the 2003 JNC 7 guidelines for the treatment of hypertension, most patients with hypertension will require treatment with at least 2 antihypertensives. First-line therapy for hypertension is a diuretic (eg, hydrochlorothiazide or chlorthalidone). When a diuretic cannot be used or when a compelling indication exists for another drug, other types of antihypertensives may be used (eg, ACEIs, ARBs, beta-blockers, CCBs). Angiotensin II receptor blockers are among the multiple choices of agents that have shown benefit in a number of different patient subtypes. Compelling indications for an ARB include patients with heart failure, diabetes, or chronic kidney disease. The *LIFE trial* (Dahlof, 2002) confirmed that ARB (losartan 50-100 mg daily) was better tolerated than a beta-blocker (atenolol), and resulted in significant reduction in mortality, angina, or HF hospitalization (primary endpoint). Stroke and new-onset diabetes were significantly reduced in the losartan treatment group.

Treatment should be targeted to a goal blood pressure of <140/90 mm Hg. If diabetes or renal disease coexists, the blood pressure goal should be <130/80 mm Hg.

Cautions: Similar to ACE inhibitors, pre-existing volume depletion caused by diuretic therapy may potentiate hypotension in response to angiotensin II antagonists. Concomitant NSAID therapy may attenuate blood pressure control; use of NSAIDs should be avoided or limited, with monitoring of blood pressure control. In the setting of heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema. Because of the lack of effect on the response to bradykinin, angiotensin receptor blockers are less likely to be associated with nonrenin-angiotensin effects such as cough and angioedema. The angiotensin II antagonists do not cause increases in levels of bradykinin as the ACEIs do.

Index TermsHydrochlorothiazide and Olmesartan Medoxomil; Olmesartan Medoxomil and Hydrochlorothiazide

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(ole me SAR tan)

U.S. Brand NamesBenicar®

Canadian Brand NamesOlmetec®

Pharmacologic CategoryAngiotensin II Receptor Blocker

Use: Labeled IndicationsTreatment of hypertension with or without concurrent use of other antihypertensive agents

Dosing: Adults**Antihypertensive:** Oral: Initial: Usual starting dose is 20 mg once daily; if initial response is inadequate, may be increased to 40 mg once daily after 2 weeks. May administer with other antihypertensive agents if blood pressure inadequately controlled with olmesartan. Consider lower starting dose in patients with possible depletion of intravascular volume (eg, patients receiving diuretics).

Dosing: ElderlyInitial: May start at 5-10 mg/day (due to concomitant disease or age changes).

Dosing: Renal ImpairmentNo specific guidelines for dosage adjustment; patients undergoing hemodialysis have not been studied.

Dosing: Hepatic ImpairmentNo adjustment necessary.

Administration: OralMay be administered with or without food.

Dietary ConsiderationsMay be taken with or without food.

StorageStore at 20°C to 25°C (68°F to 77°F).

ContraindicationsHypersensitivity to olmesartan or any component of the formulation

Allergy Considerations

- Angiotensin Receptor Antagonist Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Hyperkalemia: May occur; risk factors include renal dysfunction, diabetes mellitus, concomitant use of potassium-sparing diuretics, potassium supplements and/or potassium containing salts. Use cautiously, if at all, with these agents and monitor potassium closely.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

Disease-related concerns:

- Aortic/mitral stenosis: Use caution in patients with significant aortic/mitral stenosis.

- Hypovolemia: Avoid use or use a smaller dose in patients who are volume depleted; correct depletion first.

- Renal artery stenosis: Use olmesartan with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use with caution with pre-existing renal insufficiency and severe renal impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, drugs that act on the angiotensin system can cause injury and death to the developing fetus when used in the second and third trimesters. Angiotensin receptor blockers should be discontinued as soon as possible once pregnancy is detected.**

Geriatric ConsiderationsNo dosage adjustment is necessary when initiating angiotensin II receptor antagonists in the elderly. In clinical studies, no differences between younger adults and the elderly were demonstrated.

For age alone, consider hydration status to avoid hypotension; many elderly are volume depleted due to age-related blunting of the thirst reflex and diuretic use. May consider starting this medication at 5-10 mg once daily.

Pregnancy Risk FactorC (1st trimester); D (2nd and 3rd trimesters)

Pregnancy ConsiderationsMedications which act on the renin-angiotensin system are reported to have the following fetal/neonatal effects:

Hypotension, neonatal skull hypoplasia, anuria, renal failure, and death; oligohydramnios is also reported. These effects are reported to occur with exposure during the second and third trimesters. There are no adequate and well-controlled studies in pregnant women. **[U.S. Boxed Warning]: Based on human data, drugs that act on the angiotensin system can cause injury and death to the developing fetus when used in the second and third trimesters. Angiotensin receptor blockers should be discontinued as soon as possible once pregnancy is detected.**

LactationExcretion in breast milk unknown/contraindicated

Adverse Reactions

1% to 10%:

Central nervous system: Dizziness (3%), headache

Endocrine & metabolic: Hyperglycemia, hypertriglyceridemia

Gastrointestinal: Diarrhea

Neuromuscular & skeletal: Back pain, CPK increased

Renal: Hematuria

Respiratory: Bronchitis, pharyngitis, rhinitis, sinusitis

Miscellaneous: Flu-like syndrome

<1%: Abdominal pain, arthralgia, arthritis, bilirubin increased, chest pain, dyspepsia, facial edema, fatigue, gastroenteritis, hypercholesterolemia, hyperlipidemia, hyperuricemia, insomnia, liver enzymes increased, myalgia, nausea, pain, peripheral edema, rash, skeletal pain, tachycardia, urinary tract infection, vertigo

Postmarketing and/or case reports: Acute renal failure, alopecia, angioedema, hyperkalemia, pruritus, rhabdomyolysis, serum creatinine increased, urticaria, vomiting, weakness

Drug Interactions

ACE Inhibitors: Angiotensin II Receptor Blockers may enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Eltrombopag: May increase the serum concentration of OATP1B1/SLCO1B1 Substrates. Management: According to eltrombopag prescribing information, consideration of a preventative dose reduction may be warranted. *Risk D: Consider therapy modification*

Eplerenone: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Angiotensin II Receptor Blockers may increase the serum concentration of Lithium. Management: Lithium dosage reductions will likely be needed following the addition of an angiotensin II receptor antagonist. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: Angiotensin II Receptor Blockers may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Trimethoprim: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Does not affect olmesartan bioavailability.

Herb/Nutraceutical: Avoid bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (American), kola, licorice (may worsen hypertension). Avoid black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse (may have increased antihypertensive effect).

Monitoring ParametersBlood pressure, serum potassium

Nursing: Physical Assessment/MonitoringUse caution in presence of volume depletion, renal insufficiency, aortic/mitral stenosis. Assess potential for interactions with other pharmacological agents and herbal products patient may be taking. Evaluate therapeutic effectiveness (blood pressure) and adverse response (eg, tachycardia, hypotension, diarrhea, bronchitis) on a regular basis throughout therapy. Instruct patients with diabetes to monitor glucose levels closely (may cause hyperglycemia). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsSerum potassium

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Do not use potassium supplement or salt substitutes without consulting prescriber. Take exactly as directed. Do not alter dose or discontinue without consulting prescriber. May be taken with or without food. This drug does not eliminate the need for diet or exercise regimen as recommended by prescriber. If you have diabetes, check glucose levels closely (drug may alter glucose levels). May cause headache or dizziness (use caution when driving or engaging in tasks that require alertness until response to drug is known); diarrhea (boiled milk, buttermilk, or yogurt may help); or back or joint pain (consult prescriber for approved analgesic). Report chest pain or palpitations; unrelieved headache; flu-like symptoms or upper respiratory infection; or other persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Consult prescriber for appropriate contraceptive measures if necessary or if you suspect you might be pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as medoxomil:

Benicar®: 5 mg, 20 mg, 40 mg

Generic AvailableNo

ManufacturerSankyo Pharma Inc

Pricing: U.S. (www.drugstore.com)

Tablets (Benicar)

5 mg (30): $61.64

20 mg (30): $67.06

40 mg (30): $75.34

Mechanism of ActionAs a selective and competitive, nonpeptide angiotensin II receptor antagonist, olmesartan blocks the vasoconstrictor and aldosterone-secreting effects of angiotensin II; olmesartan interacts reversibly at the AT1 and AT2 receptors of many tissues and has slow dissociation kinetics; its affinity for the AT1 receptor is 12,500 times greater than the AT2 receptor. Angiotensin II receptor antagonists may induce a more complete inhibition of the renin-angiotensin system than ACE inhibitors, they do not affect the response to bradykinin, and are less likely to be associated with nonrenin-angiotensin effects (eg, cough and angioedema). Olmesartan increases urinary flow rate and, in addition to being natriuretic and kaliuretic, increases excretion of chloride, magnesium, uric acid, calcium, and phosphate.

Pharmacodynamics/Kinetics

Distribution: 17 L; does not cross the blood-brain barrier (animal studies)

Protein binding: 99%

Metabolism: Olmesartan medoxomil is hydrolyzed in the GI tract to active olmesartan. No further metabolism occurs.

Bioavailability: 26%

Half-life elimination: Terminal: 13 hours

Time to peak: 1-2 hours

Excretion: All as unchanged drug: Feces (50% to 65%); urine (35% to 50%)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentMay cause hyperglycemia and hypertriglyceridemia; combined use with psychotropics (atypical antipsychotics and mirtazapine) may produce additive effects; may cause diarrhea, these effects may be additive with concurrent use of SSRIs, lithium, or valproate. May cause flu-like symptoms, take this into consideration if also concerned about SSRI discontinuation syndrome. Combined use with lithium may produce lithium toxicity; monitor lithium levels.

Cardiovascular Considerations

Hypertension: According to the 2003 JNC 7 guidelines for the treatment of hypertension, most patients with hypertension will require treatment with at least 2 antihypertensives. First-line therapy for hypertension is a diuretic (eg, hydrochlorothiazide or chlorthalidone). When a diuretic cannot be used or when a compelling indication exists for another drug, other types of antihypertensives may be used (eg, ACEIs, ARBs, beta-blockers, CCBs). Angiotensin II receptor blockers are among the multiple choices of agents that have shown benefit in a number of different patient subtypes. Compelling indications for an ARB include patients with heart failure, diabetes, or chronic kidney disease. The *LIFE trial* (Dahlof, 2002) confirmed that ARB (losartan 50-100 mg daily) was better tolerated than a beta-blocker (atenolol), and resulted in significant reduction in mortality, angina, or HF hospitalization (primary endpoint). Stroke and new-onset diabetes were significantly reduced in the losartan treatment group.

Treatment should be targeted to a goal blood pressure of <140/90 mm Hg. If diabetes or renal disease coexists, the blood pressure goal should be <130/80 mm Hg.

Cautions: Similar to ACE inhibitors, pre-existing volume depletion caused by diuretic therapy may potentiate hypotension in response to angiotensin II antagonists. Concomitant NSAID therapy may attenuate blood pressure control; use of NSAIDs should be avoided or limited, with monitoring of blood pressure control. In the setting of heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema. Because of the lack of effect on the response to bradykinin, angiotensin receptor blockers are less likely to be associated with nonrenin-angiotensin effects such as cough and angioedema. The angiotensin II antagonists do not cause increases in levels of bradykinin as the ACEIs do.

Anesthesia and Critical Care Concerns/Other Considerations The angiotensin II receptor antagonists appear to have similar indications as the ACE inhibitors. In heart failure, the angiotensin II antagonists are especially useful in providing an alternative therapy in those patients who have intractable cough in response to ACE inhibitor therapy. Candesartan has been studied as an alternative therapy in chronic heart failure patients who cannot tolerate an ACE-I (CHARM-Alternative) and as an added therapy in heart failure patients who are maintained on an ACE-I (CHARM-Added). In both studies, the combined endpoint of cardiovascular death or heart failure hospitalizations was significantly improved over the placebo-treated group. Similar to ACE inhibitors, pre-existing volume depletion caused by diuretic therapy may potentiate hypotension in response to angiotensin II antagonists. Concomitant NSAID therapy may attenuate blood pressure control; use of NSAIDs should be avoided or limited, with monitoring of blood pressure control. In the setting of heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema.

Index Terms Olmesartan Medoxomil

Medication Safety Issues

Sound-alike/look-alike issues:

Patanol® may be confused with Platinol®

International issues:

Patanol® may be confused with Betanol® which is a brand name for metipranolol in Monaco and a brand name for atenolol in Bangladesh

Pronunciation(oh la PAT a deen)
U.S. Brand NamesPataday™; Patanase®; Patanol®
Canadian Brand NamesPatanol®
Pharmacologic CategoryHistamine H_1 Antagonist; Histamine H_1 Antagonist, Second Generation
Use: Labeled Indications

Nasal spray: Treatment of the symptoms of seasonal allergic rhinitis

Ophthalmic: Treatment of the signs and symptoms of allergic conjunctivitis

Dosing: Adults**Allergic conjunctivitis:** Ophthalmic:

Patanol®: Instill 1drop into affected eye(s) twice daily (allowing 6-8 hours between doses); results from an environmental study demonstrated that olopatadine was effective when dosed twice daily for up to 6 weeks

Pataday™: Instill 1 drop into affected eye(s) once daily

Seasonal allergic rhinitis: Intranasal (Patanase®): 2 sprays into each nostril twice daily

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Allergic conjunctivitis: Ophthalmic: Children ≥3 years: Refer to adult dosing.

Seasonal allergic rhinitis: Intranasal: Children ≥12 years: Refer to adult dosing.

Administration: InhalationInhalation (Patanase®): For intranasal use only. Before initial use of the nasal spray, the delivery system should be primed with 5 sprays or until a fine mist appears. If 7 or more days have elapsed since last use, the delivery system should be reprimed with 2 sprays or until a fine mist appears. Blow nose to clear nostrils. Keep head tilted downward when spraying. Insert applicator into nostril, keeping bottle upright, and close off the other nostril. Breathe in through nose. While inhaling, press pump to release spray. Alternate sprays between nostrils. After each use, wipe the spray tip with a clean tissue or cloth.
Administration: OtherOphthalmic (Patanol®, Pataday™): For topical ophthalmic use only. After instilling drops, wait at least 10 minutes before inserting contact lenses. Do not insert contacts if eyes are red.
Storage

Nasal spray: Store at 4°C to 25°C (39°F to 77°F).

Ophthalmic solution: Store at 2°C to 25°C (36°F to 77°F).

ContraindicationsHypersensitivity to olopatadine hydrochloride or any component of the formulation
Warnings/Precautions

Dosage form specific issues:

- Nasal spray: May cause drowsiness in some patients; instruct patient to use caution when driving or operating machinery. Effects may be additive with CNS depressants and/or ethanol. Periodically examine nasal mucosa for ulceration and consider discontinuing if ulceration occurs. Safety and efficacy have not been established in children <12 years of age.

- Ophthalmic: Not for use to treat contact lens-related irritation. Solution contains benzalkonium chloride; remove lens prior to administration and wait at least 10 minutes before reinserting. Do not use contact lenses if eyes are red. Safety and efficacy have not been established in children <3 years of age.

Geriatric ConsiderationsNo specific information in the elderly.
Pregnancy Risk FactorC
Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies; however, a decrease in fetal weight and a decrease in

live births were observed. There are no adequate and well-controlled studies in pregnant women.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

Nasal spray:

>10%: Gastrointestinal: Bitter taste (13%)

1% to 10%:

Central nervous system: Somnolence (1%)

Gastrointestinal: Xerostomia (1%)

Genitourinary: Urinary tract infection (1%)

Neuromuscular & skeletal: CPK increased (1%)

Respiratory: Nasal ulceration (9%), epistaxis (3%), pharyngolaryngeal pain (2%), postnasal drip (2%), cough (1%), throat irritation (1%)

Miscellaneous: Influenza (1%)

<1%: Weight gain

Ophthalmic:

>5%:

Central nervous system: Cold syndrome (up to 10%), headache (up to 7%)

Respiratory: Pharyngitis (up to 10%)

≤5%:

Gastrointestinal: Nausea, taste perversion

Neuromuscular & skeletal: Back pain, weakness

Ocular: Blurred vision, burning, conjunctivitis, dry eyes, eye pain, eyelid edema, foreign body sensation, hyperemia, itching, keratitis, ocular pruritus, stinging

Respiratory: Cough, rhinitis, sinusitis

Miscellaneous: Flu-like syndrome, hypersensitivity, infection

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may cause increased somnolence or fatigue).

Monitoring ParametersObserve patients periodically for adverse nasal effects (eg, ulceration, perforation)

Nursing: Physical Assessment/MonitoringAssess therapeutic response and adverse effects. Assess nasal mucosa periodically for ulceration. Teach patient proper use, side effects/appropriate interventions, and symptoms to report.

Patient Education**Pregnancy precaution:** Inform prescriber if you are pregnant.

Ophthalmic: For use in eyes only. Do not let tip of applicator touch eye; do not contaminate tip of applicator (may cause eye infection, eye damage, or vision loss). Do not wear contact lenses if eyes are red. Can cause cold-like symptoms and headache.

Inhalation: May cause drowsiness. Do not operate machinery or participate in activities requiring alertness until response to medication is known. May cause bitter taste. Avoid alcohol use. Report ulcers or discomfort in nose.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, intranasal [spray]:

Patanase®: 0.6% (30.5 g) [contains benzalkonium chloride; equivalent to olopatadine hydrochloride 665 mcg/100 microliters; 240 metered sprays]

Solution, ophthalmic:

Patanol®: 0.1% (5 mL) [contains benzalkonium chloride]

Pataday™: 0.2% (2.5 mL) [contains benzalkonium chloride]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Solution (Pataday)

0.2% (2.5): $90.49

Solution (Patanase)

0.6% (30.5): $89.99

Solution (Patanol)

0.1% (5): $89.99

Mechanism of Action

Selective histamine H_1-antagonist; inhibits release of histamine from mast cells. Inhibits histamine induced effects on conjunctival epithelial cells and the respiratory tract. Has no effect on alpha-adrenergic, dopaminergic, and muscarinic type 1 and 2 receptors.

Pharmacodynamics/Kinetics

Onset of action: Intranasal: 30 minutes in seasonal allergy patients

Absorption: Ophthalmic: Low systemic absorption

Protein binding: ~55% (primarily albumin)

Metabolism: Not extensively metabolized

Bioavailability: Intranasal: 57%

Half-life elimination: Ophthalmic: ~3 hours ; Intranasal: 8-12 hours

Time to peak, serum: Intranasal: 15 minutes to 2 hours

Excretion: Urine (60% to 70%, mostly as unchanged drug); feces (17%)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Taste perversion.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsOlopatadine Hydrochloride

International Brand NamesAllelock (KP); Opatanol (AT, BE, BG, CH, CZ, DE, DK, ES, FI, FR, GB, GR, HN, IE, IT, NL, NO, PL, PT, RU, SE, TR); Patanol (AR, AU, BO, BR, CL, CN, CO, CR, DO, EC, GT, HK, HN, ID, IL, MX, MY, NI, PA, PE, PH, PR, PY, SG, SV, TH, TW, UY, VE, ZA)

Olsalazine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Olsalazine may be confused with OLANZapine

Dipentum® may be confused with Dilantin®

Pronunciation(ole SAL a zeen)
U.S. Brand NamesDipentum®
Canadian Brand NamesDipentum®
Pharmacologic Category5-Aminosalicylic Acid Derivative
Use: Labeled IndicationsMaintenance of remission of ulcerative colitis in patients intolerant to sulfasalazine
Dosing: Adults**Ulcerative colitis:** Oral: 1 g/day in 2 divided doses
Dosing: ElderlyRefer to adult dosing.
Administration: OralAdminister with food in evenly divided doses.
Dietary ConsiderationsTake with food, increases residence of drug in body.
ContraindicationsHypersensitivity to olsalazine, salicylates, or any component of the formulation
Allergy Considerations

- 5-Aminosalicylic Acid Derivative Allergy

Warnings/Precautions

Concerns related to adverse effects:

• Colitis: May exacerbate symptoms of colitis.

• Diarrhea: A common adverse effect is diarrhea.

Disease-related concerns:

• Asthma: Use with caution in patients with severe allergies or asthma.

• Hepatic impairment: Use with caution in patients with hepatic impairment.

• Renal impairment: Use with caution in patients with renal impairment.

Special populations:

• Elderly: Use with caution.

• Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsNo specific data is available on elderly to suggest the drug needs alterations in dose. Since so little is absorbed, dosing should not be changed for reasons of age. Diarrhea may pose a serious problem for elderly in that it may cause dehydration, electrolyte imbalance, hypotension, and confusion.
Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal studies have demonstrated fetal developmental toxicities. There are no well-controlled studies in pregnant women. Use during pregnancy only if clearly necessary.
LactationEnters breast milk/not recommended
Breast-Feeding ConsiderationsThe active metabolite, 5-aminosalicylic acid may pass into breast milk. Diarrhea has been reported in breast-fed infants whose mothers took olsalazine.
Adverse Reactions

>10%: Gastrointestinal: Diarrhea (11% to 17%; dose related)

1% to 10%:

Central nervous system: Headache (5%), depression (2%). fatigue (2%), vertigo (1%)

Dermatologic: Rash (2%), pruritus (1%)

Gastrointestinal: Abdominal pain/cramps (10%), heartburn (2%), nausea (5%), stomatitis (1%), vomiting (1%)

Neuromuscular & skeletal: Arthralgia (4%)

Respiratory: Upper respiratory infection (2%)

Postmarketing and/or case reports: Alopecia, angioedema, anorexia, aplastic anemia, bilirubin increase, blood dyscrasias, blood in stool, blurred vision, bronchospasm, cholestatic jaundice, chills, cirrhosis, dehydration, dry eyes, dyspnea, dysuria, eosinophilia, erythema, erythema nodosum, fever, flare of symptoms, flatulence, heart block (second degree), hematuria, hemolytic anemia, hepatitis, hepatic failure, hepatic necrosis, hot flashes, hypertension, impotence, insomnia, interstitial nephritis, interstitial pneumonia, irritability, jaundice, Kawasaki-like syndrome, leukopenia, lymphopenia, menorrhagia, muscle cramps, myalgia, myocarditis, nephritic syndrome, neutropenia, orthostatic hypotension, palpitation, pancreatitis, pancytopenia, paresthesia, pericarditis, peripheral edema, photosensitivity, proteinuria, rectal bleeding, rectal discomfort, rigors, tachycardia, thrombocytopenia, tinnitus, transaminase increase, tremor, urinary frequency, watery eyes, xerostomia

Drug Interactions

Cardiac Glycosides: 5-ASA Derivatives may decrease the absorption of Cardiac Glycosides. *Risk C: Monitor therapy*

Thiopurine Analogs: 5-ASA Derivatives may decrease the metabolism of Thiopurine Analogs. *Risk C: Monitor therapy*

Varicella Virus-Containing Vaccines: 5-ASA Derivatives may enhance the adverse/toxic effect of Varicella Virus-Containing Vaccines. The primary concern is the potential development of Reye's Syndrome, a condition that has been associated with the use of salicylates in children with varicella infections. *Risk D: Consider therapy modification*

Test InteractionsIncreased ALT, AST (S), GGT, LDH, alkaline phosphatase, bilirubin

Monitoring ParametersCBC, hepatic function, renal function; stool frequency

Nursing: Physical Assessment/MonitoringAssess allergy history before initiating therapy (salicylates, sulfasalazine, or mesalamine). Assess effectiveness (reduction of clinical signs of ulcerative colitis) and adverse effects (eg, diarrhea). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report

Monitoring: Lab TestsCBC, hepatic function, renal function

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed, with meals, in evenly divided doses. May cause flu-like symptoms or muscle pain (consult prescriber for approved analgesic); diarrhea (buttermilk, boiled milk, or yogurt may help); or nausea or loss of appetite (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report persistent diarrhea or abdominal cramping, skin rash or itching, or other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as sodium: 250 mg

Generic AvailableNo

ManufacturerUCB, Inc

Pricing: U.S. (www.drugstore.com)

Capsules (Dipentum)

250 mg (100): $179.99

Mechanism of ActionMesalamine (5-aminosalicylic acid) is the active component of olsalazine; the specific mechanism of action of mesalamine is unknown; however, it is thought that it modulates local chemical mediators of the inflammatory response, especially leukotrienes, and is also postulated to be a free radical scavenger or an inhibitor of tumor necrosis factor (TNF); action appears topical rather than systemic.

Pharmacodynamics/Kinetics

Absorption: <3%; very little intact olsalazine is systemically absorbed

Protein binding, plasma: >99%

Metabolism: Primarily via colonic bacteria to active drug, 5-aminosalicylic acid

Half-life elimination: 56 minutes

Time to peak: ~1 hour

Excretion: Primarily feces

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness or depression

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsOlsalazine Sodium

International Brand NamesDipentum (AE, AR, AT, AU, BH, CH, CY, DE, DK, EG, FI, FR, GB, GR, HN, HU, IE, IL, IQ, IR, IT, JO, KW, LB, LY, NL, NO, OM, QA, SA, SE, SY, YE, ZA); Rasal (ES)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(oh mah lye ZOO mab)

U.S. Brand NamesXolair®

Canadian Brand NamesXolair®

Pharmacologic CategoryMonoclonal Antibody, Anti-Asthmatic

Use: Labeled IndicationsTreatment of moderate-to-severe, persistent allergic asthma not adequately controlled with inhaled corticosteroids

Dosing: Adults**Asthma:** SubQ: Dose is based on pretreatment IgE serum levels and body weight. Dosing should not be adjusted based on IgE levels taken during treatment or <1 year following discontinuation of therapy; doses should be adjusted during treatment for significant changes in body weight.

IgE ≥30-100 int. units/mL:

  30-90 kg: 150 mg every 4 weeks

  >90-150 kg: 300 mg every 4 weeks

IgE >100-200 int. units/mL:

  30-90 kg: 300 mg every 4 weeks

  >90-150 kg: 225 mg every 2 weeks

IgE >200-300 int. units/mL:

  30-60 kg: 300 mg every 4 weeks

  >60-90 kg: 225 mg every 2 weeks

  >90-150 kg: 300 mg every 2 weeks

IgE >300-400 int. units/mL:

  30-70 kg: 225 mg every 2 weeks

  >70-90 kg: 300 mg every 2 weeks

  >90 kg: Do not administer dose

IgE >400-500 int. units/mL:

  30-70 kg: 300 mg every 2 weeks

  >70-90 kg: 375 mg every 2 weeks

  >90 kg: Do not administer dose

IgE >500-600 int. units/mL:

  30-60 kg: 300 mg every 2 weeks

  >60-70 kg: 375 mg every 2 weeks

  >70 kg: Do not administer dose

IgE >600-700 int. units/mL:

  30-60 kg: 375 mg every 2 weeks

  >60 kg: Do not administer dose

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Asthma:** Children ≥12 years: SubQ: Refer to adult dosing.

Administration: OtherFor SubQ injection only; doses >150 mg should divided over more than one site. Injections may take 5-10 seconds to administer. Administer only under direct medical supervision and observe patient for a minimum of 2 hours following administration of any dose given.

StoragePrior to reconstitution, store under refrigeration at 2°C to 8°C (36°F to 46°F); product may be shipped at room temperature. Following reconstitution, protect from direct sunlight. May be stored for up to 8 hours if refrigerated or 4 hours if stored at room temperature.

ReconstitutionPrepare using SWFI, USP only; add SWFI 1.4 mL to upright vial and swirl gently for 5-10 seconds every 5 minutes until dissolved; may take >20 minutes to dissolve completely. Resulting solution is 150 mg/1.2 mL. Do not use if powder takes >40 minutes to dissolve.

RestrictionsAn FDA-approved medication guide is available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm; distribute to each patient to whom this medication is dispensed.

ContraindicationsHypersensitivity to omalizumab or any component of the formulation; acute bronchospasm, status asthmaticus

Warnings/Precautions

Boxed warnings:

- Anaphylaxis: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: **[U.S. Boxed Warning]: Anaphylaxis, including delayed-onset anaphylaxis, has been reported following administration; reactions usually occur within 2 hours of administration, but may occur up to 24 hours and in some cases >1 year after initiation of regular treatment.** Patients should receive treatment only under direct medical supervision and be observed for a minimum of 2 hours following administration; appropriate medications for the treatment of anaphylactic reactions should be available. Hypersensitivity reactions may occur following any dose, even during chronic therapy; discontinue therapy following any severe reaction.

- Malignant neoplasms: Have been reported with use in short-term studies; impact of long-term use is not known.

Disease-related concerns:

- Patients at risk for parasitic infections: Use with caution and monitor patients at risk for parasitic (helminth) infections; risk of infection may be increased.

Concurrent drug therapy issues:

- Corticosteroid therapy: Gradually taper corticosteroid therapy, do not discontinue abruptly.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Other warnings/precautions:

- Appropriate use: For use in patients with a documented reactivity to a perennial aeroallergen and with symptoms uncontrolled using inhaled corticosteroids; not used to control acute asthma symptoms.

- Dosing/IgE levels: Dosing is based on pretreatment IgE serum levels and body weight. IgE levels remain elevated up to 1 year following treatment, therefore, levels taken during treatment cannot be used as a dosage guide.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women. IgG molecules are known to cross the placenta; use during pregnancy only if clearly needed. A registry has been established to monitor outcomes of women exposed to omalizumab during pregnancy or within 8 weeks prior to pregnancy (866-496-5247).

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsIgG is excreted in human milk and excretion of omalizumab is expected. Effects to nursing infant are not known; use with caution.

Adverse Reactions

>10%:

Central nervous system: Headache (15%)

Local: Injection site reaction (45%; placebo 43%; severe 12%). Most reactions occurred within 1 hour, lasted <8 days, and decreased in frequency with additional dosing.

Respiratory: Upper respiratory tract infection (20%), sinusitis (16%), pharyngitis (11%)

Miscellaneous: Viral infection (23%)

1% to 10%:

Central nervous system: Pain (7%), fatigue (3%), dizziness (3%)

Dermatologic: Dermatitis (2%), pruritus (2%)

Neuromuscular & skeletal: Arthralgia (8%), leg pain (4%), arm pain (2%), fracture (2%)

Otic: Earache (2%)

<1%, postmarketing, and/or case reports: Alopecia; anaphylaxis (angioedema of the throat or tongue, bronchospasm, chest tightness, cough, cutaneous angioedema, dyspnea, hypotension, generalized pruritus, syncope, and urticaria); antibody formation to omalizumab, hot flushes, malignancy (0.5%; placebo 0.2%), throat edema, thrombocytopenia, tongue edema, urticaria, wheezing

Drug InteractionsThere are no known significant interactions.

Test InteractionsTotal IgE levels are elevated for up to 1 year following treatment. Total serum IgE may be retested after interruption of therapy for 1 year or more.

Monitoring ParametersAnaphylactic/hypersensitivity reactions, baseline IgE; FEV_1, peak flow, and/or other pulmonary function tests;

monitor for signs of infection

Nursing: Physical Assessment/MonitoringFor SubQ use only. Evaluate results of laboratory tests and pulmonary function tests at baseline and as necessary with treatment. Anaphylactic reactions have been reported within 2 -24 hours (or longer) of initial dose; patient should be monitored for a minimum of 2 hours following injection and appropriate medications for the treatment of hypersensitivity reactions should be available. Evaluate patient response (relief of asthmatic symptoms) and adverse reactions (eg, hypersensitivity reaction, upper respiratory tract infection, viral infection, dermatitis, arthralgia) at beginning and periodically during therapy. Caution patient to read the FDA-approved medication guide distributed when medication is dispensed. Teach patient possible side effects/interventions and adverse symptoms to report (eg, signs of hypersensitivity reaction).

Monitoring: Lab TestsAnaphylactic/hypersensitivity reactions, baseline IgE; FEV$_1$, peak flow, and/or other pulmonary function tests

Patient EducationThis medication is administered by injection and you will be closely monitored for some time following injection. Report immediately any sign of allergic response (redness, swelling, pain or itching at injection site; chest pain or tightness; difficulty breathing or swallowing; swelling of mouth or tongue; skin rash). If allergic response occurs after you leave, follow prescriber's directions for contacting emergency treatment immediately. May cause headache or dizziness (use caution when driving or engaging in hazardous tasks until response to drug is known); joint, bone, or ear pain (consult prescriber for analgesic). Report unusual or increased respiratory difficulty, signs of infection, skin rash, or other persistent reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if you are breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [preservative free]:

Xolair®: 150 mg [contains sucrose 145.5 g]

Generic AvailableNo

ManufacturerGenentech, Inc

Pricing: U.S. (www.drugstore.com)

Solution (reconstituted) (Xolair)

150 mg (1): $671.91

Mechanism of ActionOmalizumab is an IgG monoclonal antibody (recombinant DNA derived) which inhibits IgE binding to the high-affinity IgE receptor on mast cells and basophils. By decreasing bound IgE, the activation and release of mediators in the allergic response (early and late phase) is limited. Serum-free IgE levels and the number of high-affinity IgE receptors are decreased. Long-term treatment in patients with allergic asthma showed a decrease in asthma exacerbations and corticosteroid usage.

Pharmacodynamics/Kinetics

Absorption: Slow following SubQ injection

Distribution: V$_d$: 78 ± 32 mL/kg

Metabolism: Hepatic; IgG degradation by reticuloendothelial system and endothelial cells

Bioavailability: 62%

Half-life elimination: 26 days

Time to peak: 7-8 days

Excretion: Primarily via hepatic degradation; intact IgG may be secreted in bile

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness and fatigue

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsrhuMAb-E25

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Omacor® may be confused with Amicar®

Pronunciation(oh MEG a three AS id ETH il ES ters)

U.S. Brand NamesLovaza®; Omacor® [DSC]

Pharmacologic CategoryAntilipemic Agent, Miscellaneous

Use: Labeled IndicationsLovaza®: Adjunct to diet therapy in the treatment of hypertriglyceridemia (≥500 mg/dL)

Note: A number of OTC formulations containing omega-3 fatty acids are marketed as nutritional supplements; these do not have FDA-approved indications and may not contain the same amounts of the active ingredient.

Use: Unlabeled/InvestigationalLovaza®: Treatment of IgA nephropathy

Dosing: Adults

Hypertriglyceridemia: Oral: 4 g/day as a single daily dose or in 2 divided doses.

Treatment of IgA nephropathy (unlabeled use): Oral: 4 g/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo dosage adjustment required.

Administration: OralMay be administered with or without food.

Dietary ConsiderationsMay be taken with or without food. Dietary modification is important in the control of severe hypertriglyceridemia. Maintain standard cholesterol-lowering diet during therapy..

StorageStore at controlled room temperature of 25°C (77°F); do not freeze.

ContraindicationsHypersensitivity to omega-3-acid ethyl esters or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Fish allergy: Use with caution in patients with known allergy or sensitivity to fish.
- Hepatic effects: ALT may increase without concurrent AST increase; periodically monitor hepatic transaminases.
- Lipid effects: May increase LDL levels; periodically monitor LDL levels.
- Prolongation of bleeding time: Prolongation of bleeding time has been observed in some clinical studies; use with caution in patients with coagulopathy or in those receiving therapeutic anticoagulation. Monitor for changes in INR following initiation and dosage changes of omega-2-acid ethyl esters in patients receiving warfarin.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: Should be used as an adjunct to diet therapy and exercise and only in those with very high triglyceride levels (≥500 mg/dL). Secondary causes of hyperlipidemia should be ruled out prior to therapy.
- Inadequate response: If triglyceride levels do not adequately respond after 2 months of treatment with omega-3-acid ethyl esters, discontinue treatment.

Geriatric ConsiderationsSpecific information about the safety and efficacy of omega-3-acid ethyl esters is limited. The manufacturer states there were no apparent differences between persons <60 and >60 years of age.

Pregnancy Risk FactorC

Pregnancy ConsiderationsIn some animal studies, embryocidal and maternal effects have been observed at high doses. There are no adequate or well-controlled studies in pregnant women. Use during pregnancy only if potential benefit outweighs possible risk.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

Cardiovascular: Angina (1%)

Central nervous system: Pain (2%)

Dermatologic: Rash (2%)

Gastrointestinal: Eructation (5%), dyspepsia (3%), taste perversion (3%)

Neuromuscular & skeletal: Back pain (2%)

Miscellaneous: Flu-like syndrome (4%), infection (4%)

<1%, postmarketing, and/or case reports: Abdominal distention, alopecia, anorexia, appetite increased, arrhythmia, arthralgia, arthritis, asthma, body odor, bronchitis, cardiac arrest, cataract, chest pain, chills, colitis, constipation, cough, depression, diaphoresis, dizziness, dysphagia, dyspnea, eczema, edema, emotional lability, epididymitis, epistaxis, facial paralysis, fecal incontinence, fever, fracture, fungal infection, gastritis, gastroenteritis, GI disorder, hyperglycemia, hyperlipemia, hypertension, impotence, insomnia, intestinal obstruction, laryngitis, LDL increased, liver transaminases increased, lymphadenopathy, malaise, melena, MI, migraine, myalgia, myocardial ischemia, neck pain, neoplasm, pancreatitis, peripheral vascular disorder, pharyngitis, pneumonia, pruritus, rheumatoid arthritis, rhinitis, sinusitis, sudden death, suicide, syncope, tachycardia, tendon disorder, tenesmus, vasodilatation, vertigo, viral infection, vomiting, weakness, xerostomia

Drug Interactions

Antiplatelet Agents: Omega-3-Acid Ethyl Esters may enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Warfarin: Omega-3-Acid Ethyl Esters may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Monitor ethanol use (alcohol use may increase triglycerides).

Monitoring ParametersTriglycerides and other lipids (LDL-C) should be monitored at baseline and periodically. Hepatic transaminase levels, particularly ALT, should be monitored periodically.

Nursing: Physical Assessment/MonitoringDo not use if allergic to fish. Encourage diet and exercise along with use of this medication.

Monitoring: Lab TestsTriglycerides and other lipids (LDL-C) should be monitored at baseline and periodically. Hepatic transaminase levels, particularly ALT, should be monitored periodically.

Patient EducationDo not use if allergic to fish. This medication should be used in addition to diet and exercise. Avoid alcohol use. You may experience flu-like syndrome, fever, burping, or an "upset stomach." Report any significant or continued problems to prescriber. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber before breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule:

Lovaza®, Omacor® [DSC]: 1 g [contains EPA ~465 mg and DHA ~375 mg]

ManufacturerGlaxoSmithKline

Pricing: U.S. (www.drugstore.com)

Capsules (Lovaza)

1 g (120): $162.36

Mechanism of ActionMechanism has not been completely defined. Possible mechanisms include inhibition of acyl CoA:1,2 diacylglycerol acyltransferase, increased hepatic beta-oxidation, a reduction in the hepatic synthesis of triglycerides, or an increase in plasma lipoprotein lipase activity.

Pharmacotherapy Pearls

Due to reports of prescribing errors associated with the similarity between Omacor® and Amicar,® (aminocaproic acid) the name Omacor® has been changed to Lovaza®. The size, strength, ingredients, and dose all remain the same

Mental Health: Effects on Mental StatusMay cause flu-like syndrome; rule out antidepressant withdrawal syndrome

Mental Health: Effects on Psychiatric TreatmentMay prolong bleeding time; concomitant use with SSRIs may produce additive effects; monitor. Beta-blockers may decrease the effects of omega-3-acid ethyl esters; monitor.

Special Alerts

Clopidogrel (Plavix®) and Proton Pump Inhibitors (PPIs): Ongoing Safety Review - January 2009

The U.S. Food and Drug Administration (FDA) is communicating important information regarding an ongoing safety review of clopidogrel and its effectiveness when used with proton pump inhibitors (PPIs).

Clopidogrel is a prodrug requiring hepatic conversion via CYP3A4 and/or CYP2C19 to its active metabolite. Impaired clopidogrel conversion to its active metabolite may be due to either CYP450 polymorphisms or drug-drug interactions resulting in suboptimal antiplatelet activity.

A PPI is often prescribed with the combination of aspirin and clopidogrel to prevent gastrointestinal bleeding. A number of PPIs are available and include esomeprazole, lansoprazole, omeprazole, pantoprazole, and rabeprazole. Several studies have reported greater clinical event rates (eg, myocardial infarction, death) or greater platelet reactivity associated with concurrent use of clopidogrel and a PPI (Ho, 2008; Pezella, 2008; Gilard, 2006). Similarly, a prospective, randomized, double-blind trial demonstrated a reduction in antiplatelet activity when omeprazole and clopidogrel are used concurrently (Gilard, 2008). Another controlled trial with the PPI lansoprazole also found evidence of a possible interaction resulting in less antiplatelet activity (Small, 2008). This interaction is thought to result from competitive inhibition of the CYP2C19-mediated activation of clopidogrel by omeprazole and other PPIs, which are all metabolized to at least some degree by CYP2C19. In contrast, one study with esomeprazole and pantoprazole did not find evidence of reduced antiplatelet activity when administered with clopidogrel (Siller-Matula, 2009), highlighting the need for additional studies to determine the degree to which individual PPIs may differ in their potential for interacting with clopidogrel.

The manufacturer of Plavix® has agreed to conduct further studies to better understand the effect of other drugs (including PPIs) and genetic factors on the effectiveness of clopidogrel. The FDA is recommending that healthcare providers continue to prescribe clopidogrel while reevaluating the need for prescription or over-the-counter (OTC) PPIs in patients taking clopidogrel. Patients should continue taking clopidogrel as directed. If taking a PPI with clopidogrel, patients should consult with their healthcare provider.

Pronunciation(oh MEP ra zole & SOW dee um bye KAR bun ate)

U.S. Brand NamesZegerid®

Pharmacologic CategoryProton Pump Inhibitor; Substituted Benzimidazole

Use: Labeled IndicationsShort-term (4-8 weeks) treatment of active duodenal ulcer disease or active benign gastric ulcer; treatment of heartburn and other symptoms associated with gastroesophageal reflux disease (GERD); short-term (4-8 weeks) treatment of endoscopically-diagnosed erosive esophagitis; maintenance healing of erosive esophagitis; reduction of risk of upper gastrointestinal bleeding in critically-ill patients

Dosing: Adults

Active duodenal ulcer: Oral: 20 mg/day for 4-8 weeks

Gastric ulcers: Oral: 40 mg/day for 4-8 weeks

Symptomatic GERD: Oral: 20 mg/day for up to 4 weeks

Erosive esophagitis: Oral: 20 mg/day for 4-8 weeks; maintenance of healing: 20 mg/day for up to 12 months total therapy (including treatment period of 4-8 weeks)

Risk reduction of upper GI bleeding in critically-ill patients (Zegerid® powder for oral suspension): Oral:

Loading dose: Day 1: 40 mg every 6-8 hours for two doses

Maintenance dose: 40 mg/day for up to 14 days; therapy >14 days has not been evaluated

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentNo adjustment is necessary.
Dosing: Hepatic ImpairmentSpecific guidelines are not available; bioavailability is increased with chronic liver disease.
Administration: Oral

Capsule: Should be swallowed whole; do not chew or crush. Capsules should **not** be opened, sprinkled on food, or administered via NG. Best if taken before breakfast.

Powder for oral suspension: Administer 1 hour before a meal. Mix with 2 tablespoons of water; stir well and drink immediately. Rinse cup with water and drink.

Administration: OtherNasogastric/orogastric tube: Powder for oral suspension: Mix well with 20 mL of water and administer immediately; flush tube with an additional 20 mL of water. Suspend enteral feeding for 3 hours before and 1 hour after administering.
Dietary ConsiderationsTake 1 hour before a meal. Each 20 mg or 40 mg packet contains sodium bicarbonate 1680 mg (20 mEq), equivalent to sodium 460 mg (20 mEq) per dose; each 20 mg or 40 mg capsule contains sodium bicarbonate 1100 mg equivalent to sodium 300 mg (13 mEq) per dose.
StorageStore at 15°C to 30°C (59°F to 86°F).
ContraindicationsHypersensitivity to omeprazole, substituted benzimidazoles (eg, esomeprazole, lansoprazole, pantoprazole, rabeprazole), or any component of the formulation
Allergy Considerations

- Proton Pump Inhibitor, Benzimidazole Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Atrophic gastritis: Long-term omeprazole therapy has caused atrophic gastritis (by biopsy).
- Carcinoma: In long-term (2-year) studies in rats, omeprazole produced a dose-related increase in gastric carcinoid tumors. While available endoscopic evaluations and histologic examinations of biopsy specimens from human stomachs have not detected a risk from short-term exposure to omeprazole, further human data on the effect of sustained hypochlorhydria and hypergastrinemia are needed to rule out the possibility of an increased risk for the development of tumors in humans receiving long-term therapy.

Disease-related concerns:

- Bartter’s syndrome: Use with caution in patients with Bartter’s syndrome; contains sodium bicarbonate.
- Gastric malignancy: Relief of symptoms does not preclude the presence of a gastric malignancy.
- Gastrointestinal infection (eg, *Salmonella, Campylobacter*): Use of proton pump inhibitors may increase risk of these infections.
- Hepatic impairment: Bioavailability may be increased in patients with hepatic dysfunction.
- Hypocalcemia: Use with caution in patients with hypocalcemia; contains sodium bicarbonate.
- Hypokalemia: Use with caution in patients with hypokalemia; contains sodium bicarbonate.
- Respiratory alkalosis: Use with caution in patients with respiratory alkalosis; contains sodium bicarbonate.

Special populations:

- Asian ethnicity: Bioavailability may be increased in patients of Asian descent.
- Elderly: Bioavailability may be increased in the elderly.
- Pediatrics: Safety and efficacy have not been established in children.
- Sodium-restricted diets: Use with caution in patients on sodium-restricted diets; contains sodium bicarbonate.

Geriatric ConsiderationsThe incidence of side effects in the elderly is no different than that of younger adults (≤65 years of age) despite slight decrease in elimination and increase in bioavailability. Dosage adjustments are not necessary. Use cautiously in patients requiring sodium restriction, hypertension, or congestive heart failure.
Pregnancy Risk FactorC
Pregnancy ConsiderationsCrosses the placenta; congenital abnormalities have been reported sporadically following omeprazole use during pregnancy. Based on data collected by the Teratogen Information System (TERIS), it was concluded that therapeutic doses used during pregnancy would be unlikely to pose a substantial teratogenic risk (quantity/quality of data: fair). Because the possibility of harm still exists, the manufacturer recommends use during pregnancy only if the potential benefit to the mother outweighs the possible risk to the fetus. Chronic use of sodium bicarbonate-containing products may lead to systemic alkalosis, edema, and weight gain; metabolic alkalosis and fluid overload may occur in mother and fetus.

Lactation Enters breast milk/not recommended

Adverse Reactions

Frequency of adverse events reported for 40 mg dose of oral powder for suspension. **Note:** Asterisked (*) percentages indicate frequency reported from a controlled clinical trial of 359 critically-ill patients.

>10%:

Central nervous system: Pyrexia (20%*)

Endocrine & metabolic: Hypokalemia (12%*), hyperglycemia (11%*)

Respiratory: Nosocomial pneumonia (11%*)

1% to 10%:

Cardiovascular: Hypotension (10%*), hypertension (8%*), atrial fibrillation (6%*), ventricular tachycardia (5%*), bradycardia (4%*), tachycardia (3%*), supraventricular tachycardia (3%*), edema (3%*)

Central nervous system: Hyperpyrexia (5%), agitation (3%), headache (2%)

Dermatological: Rash (6%*), decubitus ulcer (3%)

Endocrine & metabolic: Hypomagnesemia (10%*), hypocalcemia (6%*), hypophosphatemia (6%*), fluid overload (5%*), hypoglycemia (3%*), hyponatremia (4%*), hypernatremia (2%*), hyperkalemia (2%*)

Gastrointestinal: Constipation (5%*), diarrhea (4%*), hypomotility (2%*)

Genitourinary: Urinary tract infection (2%*)

Hematological: Thrombocytopenia (10%*), anemia (8%*), anemia increased (2%*)

Hepatic: LFTs increased (2%*)

Respiratory: ARDS (3%*), respiratory failure (2%*), URI (2%), cough (1%)

Miscellaneous: Sepsis (5%*), oral candidiasis (4%*), candidal infection (2%)

<1% (adverse event occurrence may vary based on formulation): Abdominal swelling, abnormal dreams, aggression, agranulocytosis, alkaline phosphatase increased, allergic reactions, alopecia, anaphylaxis, anemia, angina, angioedema, anorexia, anxiety, apathy, atrophic gastritis, benign gastric polyps, blurred vision, confusion, creatinine increased, depression, diaphoresis, double vision, dry mouth, dry skin, epistaxis, erythema multiforme, esophageal candidiasis, fatigue, fecal discoloration, flatulence, glycosuria, gynecomastia, hallucinations, hematuria, hemifacial dysesthesia, hemolytic anemia, hepatic encephalopathy, hepatic failure, hepatic necrosis, hyperhidrosis, hypertension, hypoglycemia, hyponatremia, insomnia, interstitial nephritis, irritable colon, jaundice, joint pain, leg pain, leukocytosis, leukopenia, liver disease (hepatocellular, cholestatic, mixed), malaise, microscopic pyuria, mucosal atrophy (tongue), muscle cramps, muscle weakness, myalgia, nausea, nervousness, neutropenia, ocular irritation, optic neuropathy, pain, palpitation, pancreatitis, pancytopenia, paresthesia, peripheral edema, petechiae, pharyngeal pain, photosensitivity, pneumothorax, proteinuria, pruritus, psychic disturbance, purpura, rash, skin inflammation, somnolence, Stevens-Johnson syndrome, stomatitis, tachycardia, taste perversion, testicular pain, thrombocytopenia, tinnitus, toxic epidermal necrolysis, tremor, urinary frequency, urinary tract infection, urticaria, vertigo, weight gain

Metabolism/Transport Effects **Substrate** of CYP2A6 (minor), 2C9 (minor), 2C19 (major), 2D6 (minor), 3A4 (minor); **Inhibits** CYP1A2 (weak), 2C9 (moderate), 2C19 (strong), 2D6 (weak), 3A4 (weak); **Induces** CYP1A2 (weak)

Drug Interactions

ACE Inhibitors: Antacids may decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists: Antacids may decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Dipivefrin. *Risk C: Monitor therapy*

Amphetamines: Alkalinizing Agents may decrease the excretion of Amphetamines. *Risk D: Consider therapy modification*

Amphetamines: Antacids may decrease the excretion of Amphetamines. *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): Antacids may decrease the serum concentration of Anticonvulsants (Hydantoin). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): Antacids may decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Antipsychotic Agents (Phenothiazines): Antacids may decrease the absorption of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Atazanavir: Antacids may decrease the absorption of Atazanavir. *Risk D: Consider therapy modification*

Atazanavir: Proton Pump Inhibitors may decrease the absorption of Atazanavir. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Proton Pump Inhibitors may increase the serum concentration of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Bisacodyl: Antacids may diminish the therapeutic effect of Bisacodyl. Antacids may cause the delayed-release bisacodyl tablets to release drug prior to reaching the large intestine. Gastric irritation and/or cramps may occur. *Risk D: Consider therapy modification*

Cefpodoxime: Antacids may decrease the serum concentration of Cefpodoxime. *Risk C: Monitor therapy*

Cefuroxime: Antacids may decrease the serum concentration of Cefuroxime. *Risk C: Monitor therapy*

Cilostazol: Omeprazole may enhance the adverse/toxic effect of Cilostazol. *Risk D: Consider therapy modification*

Clopidogrel: Proton Pump Inhibitors may diminish the therapeutic effect of Clopidogrel. This appears to be due to reduced formation of the active clopidogrel metabolite. *Risk C: Monitor therapy*

Clozapine: Omeprazole may decrease the serum concentration of Clozapine. Omeprazole may increase the serum concentration of Clozapine. *Risk C: Monitor therapy*

Corticosteroids (Oral): Antacids may decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

CycloSPORINE: Antacids may decrease the serum concentration of CycloSPORINE. Specifically when cyclosporine is administered orally. *Risk C: Monitor therapy*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Substrates: CYP2C19 Inhibitors (Strong) may decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Moderate) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

Dabigatran Etexilate: Antacids may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Dabigatran Etexilate: Proton Pump Inhibitors may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Dasatinib: Antacids may decrease the absorption of Dasatinib. *Risk D: Consider therapy modification*

Dasatinib: Proton Pump Inhibitors may decrease the absorption of Dasatinib. *Risk D: Consider therapy modification*

Delavirdine: Antacids may decrease the absorption of Delavirdine. *Risk D: Consider therapy modification*

Erlotinib: Proton Pump Inhibitors may decrease the serum concentration of Erlotinib. *Risk X: Avoid combination*

Erlotinib: Antacids may decrease the serum concentration of Erlotinib. Management: Separate the administration of erlotinib and any antacid by several hours in order to minimize the risk of a significant interaction. *Risk D: Consider therapy modification*

Fluconazole: May increase the serum concentration of Proton Pump Inhibitors. *Risk C: Monitor therapy*

Indinavir: Proton Pump Inhibitors may decrease the serum concentration of Indinavir. *Risk C: Monitor therapy*

Iron Salts: Antacids may decrease the absorption of Iron Salts. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Iron Salts: Proton Pump Inhibitors may decrease the absorption of Iron Salts. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk C: Monitor therapy*

Isoniazid: Antacids may decrease the absorption of Isoniazid. *Risk D: Consider therapy modification*

Itraconazole: Proton Pump Inhibitors may decrease the serum concentration of Itraconazole. *Risk D: Consider therapy modification*

Ketoconazole: Proton Pump Inhibitors may decrease the serum concentration of Ketoconazole. Ketoconazole may increase the serum concentration of Proton Pump Inhibitors. *Risk D: Consider therapy modification*

Lithium: Sodium Bicarbonate may increase the excretion of Lithium. *Risk C: Monitor therapy*

Memantine: Sodium Bicarbonate may decrease the excretion of Memantine. *Risk C: Monitor therapy*

Mesalamine: Antacids may diminish the therapeutic effect of Mesalamine. This appears to be formulation-related and specific to the Apriso brand of mesalamine. Management: One specific formulation of mesalamine (i.e., Apriso-brand capsules containing coated granules) should not be administered with antacids. *Risk X: Avoid combination*

Mesalamine: Proton Pump Inhibitors may diminish the therapeutic effect of Mesalamine. This appears to be formulation-related and specific to the Apriso brand of mesalamine. Management: One specific formulation of mesalamine (i.e., Apriso-brand capsules containing coated granules) should not be administered with antacids; proton pump inhibitors would be expected to interact in a similar manner. *Risk X: Avoid combination*

Methenamine: Antacids may diminish the therapeutic effect of Methenamine. *Risk D: Consider therapy modification*

Methotrexate: Proton Pump Inhibitors may decrease the excretion of Methotrexate. Antirheumatic doses of methotrexate probably hold minimal risk. *Risk C: Monitor therapy*

Mycophenolate: Proton Pump Inhibitors may decrease the serum concentration of Mycophenolate. Specifically, concentrations of the active mycophenolic acid may be reduced. *Risk C: Monitor therapy*

Nelfinavir: Proton Pump Inhibitors may decrease serum concentrations of the active metabolite(s) of Nelfinavir. Proton Pump Inhibitors may decrease the serum concentration of Nelfinavir. *Risk X: Avoid combination*

Penicillamine: Antacids may decrease the serum concentration of Penicillamine. *Risk D: Consider therapy modification*

Phenytoin: Proton Pump Inhibitors may increase the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Phosphate Supplements: Antacids may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Protease Inhibitors: Antacids may decrease the absorption of Protease Inhibitors. **Exceptions:** Darunavir. *Risk C: Monitor therapy*

QuiNIDine: Antacids may decrease the excretion of QuiNIDine. *Risk C: Monitor therapy*

Saquinavir: Proton Pump Inhibitors may increase the serum concentration of Saquinavir. *Risk C: Monitor therapy*

Tetracycline Derivatives: Antacids may decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Tipranavir: May decrease the serum concentration of Proton Pump Inhibitors. These data are derived from studies with Ritonavir-boosted Tipranavir. *Risk C: Monitor therapy*

Tocainide: Antacids may increase the serum concentration of Tocainide. *Risk C: Monitor therapy*

Trientine: Antacids may decrease the absorption of Trientine. *Risk D: Consider therapy modification*

Voriconazole: Proton Pump Inhibitors may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Warfarin: Proton Pump Inhibitors may increase the serum concentration of Warfarin. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may cause gastric mucosal irritation).

Food: Food delays absorption. When given 1 hour after a meal, absorption is reduced.

Herb/Nutraceutical: St John's wort may decrease omeprazole levels.

Nursing: Physical Assessment/MonitoringSee individual agents.

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, immediate release:

Zegerid®: 20 mg, 40 mg [both strengths contain sodium bicarbonate 1100 mg, equivalent to sodium 300 mg (13 mEq) per capsule]

Powder for oral suspension:

Zegerid®: 20 mg/packet (30s), 40 mg/packet (30s) [both strengths contain sodium bicarbonate 1680 mg, equivalent to sodium 460 mg per packet]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Capsules (Zegerid)

40-1100 mg (30): $150.84

Pack (Zegerid)

20-1680 mg (30): $157.43

40-1680 mg (30): $166.97

Mechanism of ActionSuppresses gastric basal and stimulated acid secretion by inhibiting the parietal cell H+/K+ ATP pump

Pharmacodynamics/Kinetics

Onset of action: Antisecretory: ~1 hour

Peak effect: 2 hours

Duration: 72 hours

Protein binding: 95%

Metabolism: Extensively hepatic to inactive metabolites

Bioavailability: Oral: 30% to 40%; increased in Asian patients and patients with hepatic dysfunction

Half-life elimination: 0.4-3.2 hours

Excretion: Urine (77% as metabolites, very small amount as unchanged drug); feces

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Oral candidiasis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, agitation, aggression, depression, confusion, insomnia, nervousness, anxiety, or hallucinations; may rarely cause sedation

Mental Health: Effects on Psychiatric TreatmentMay inhibit the metabolism of diazepam; monitor for increased sedation

Clopidogrel (Plavix®) and Proton Pump Inhibitors (PPIs): Ongoing Safety Review - January 2009

The U.S. Food and Drug Administration (FDA) is communicating important information regarding an ongoing safety review of clopidogrel and its effectiveness when used with proton pump inhibitors (PPIs).

Clopidogrel is a prodrug requiring hepatic conversion via CYP3A4 and/or CYP2C19 to its active metabolite. Impaired clopidogrel conversion to its active metabolite may be due to either CYP450 polymorphisms or drug-drug interactions resulting in suboptimal antiplatelet activity.

A PPI is often prescribed with the combination of aspirin and clopidogrel to prevent gastrointestinal bleeding. A number of PPIs are available and include esomeprazole, lansoprazole, omeprazole, pantoprazole, and rabeprazole. Several studies have reported greater clinical event rates (eg, myocardial infarction, death) or greater platelet reactivity associated with concurrent use of clopidogrel and a PPI (Ho, 2008; Pezella, 2008; Gilard, 2006). Similarly, a prospective, randomized, double-blind trial demonstrated a reduction in antiplatelet activity when omeprazole and clopidogrel are used concurrently (Gilard, 2008). Another controlled trial with the PPI lansoprazole also found evidence of a possible interaction resulting in less antiplatelet activity (Small, 2008). This interaction is thought to result from competitive inhibition of the CYP2C19-mediated activation of clopidogrel by omeprazole and other PPIs, which are all metabolized to at least some degree by CYP2C19. In contrast, one study with esomeprazole and pantoprazole did not find evidence of reduced antiplatelet activity when administered with clopidogrel (Siller-Matula, 2009), highlighting the need for additional studies to determine the degree to which individual PPIs may differ in their potential for interacting with clopidogrel.

The manufacturer of Plavix® has agreed to conduct further studies to better understand the effect of other drugs (including PPIs) and genetic factors on the effectiveness of clopidogrel. The FDA is recommending that healthcare providers continue to prescribe clopidogrel while reevaluating the need for prescription or over-the-counter (OTC) PPIs in patients taking clopidogrel. Patients should continue taking clopidogrel as directed. If taking a PPI with clopidogrel, patients should consult with their healthcare provider.

For more information, healthcare professionals may refer to the following FDA website:
http://www.fda.gov/cder/drug/early_comm/clopidogrel_bisulfate.htm

Medication Safety Issues

Sound-alike/look-alike issues:

Prilosec® may be confused with Plendil®, Prevacid®, predniSONE, prilocaine, Prinivil®, Proventil®, Prozac®

International issues:

Norpramin®: Brand name for desipramine in the U.S.

Pronunciation(oh MEP ra zole)

U.S. Brand NamesPrilosec OTC™ [OTC]; Prilosec®

Canadian Brand NamesApo-Omeprazole®; Losec MUPS®; Losec®; PMS-Omeprazole DR; ratio-Omeprazole; Sandoz Omeprazole

Pharmacologic CategoryProton Pump Inhibitor; Substituted Benzimidazole

Use: Labeled IndicationsShort-term (4-8 weeks) treatment of active duodenal ulcer disease or active benign gastric ulcer; treatment of heartburn and other symptoms associated with gastroesophageal reflux disease (GERD); short-term (4-8 weeks) treatment of endoscopically-diagnosed erosive esophagitis; maintenance healing of erosive esophagitis; long-term treatment of pathological hypersecretory conditions; as part of a multidrug regimen for *H. pylori* eradication to reduce the risk of duodenal ulcer recurrence

OTC labeling: Short-term treatment of frequent, uncomplicated heartburn occurring ≥2 days/week

Use: Unlabeled/InvestigationalHealing NSAID-induced ulcers; prevention of NSAID-induced ulcer; stress-ulcer prophylaxis in the critically-ill

Dosing: Adults

Active duodenal ulcer: Oral: 20 mg/day for 4-8 weeks

Gastric ulcers: Oral: 40 mg/day for 4-8 weeks

Symptomatic GERD (without esophageal lesions): Oral: 20 mg/day for up to 4 weeks

Erosive esophagitis: Oral: 20 mg/day for 4-8 weeks; maintenance of healing: 20 mg/day for up to 12 months total therapy (including treatment period of 4-8 weeks)

Peptic ulcer disease:*Helicobacter pylori* eradication: Oral: Dose varies with regimen: 40 mg/day as single dose or in 2 divided doses; requires combination therapy with antibiotics for 10-14 days; may require an additional 14-18 days of Prilosec® 20 mg/day (monotherapy) after combination treatment complete if ulcer is present

Pathological hypersecretory conditions: Oral: Initial: 60 mg once daily; doses up to 120 mg 3 times/day have been administered; administer daily doses >80 mg in divided doses

Stress-ulcer prophylaxis (ICU patients; unlabeled use): Oral: 40 mg once daily; periodically evaluate patient for continued need.

Frequent heartburn (OTC labeling): Oral: 20 mg/day for 14 days; treatment may be repeated after 4 months if needed

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

GERD or other acid-related disorders: Oral: Children 1-16 years:

5 kg to <10 kg: 5 mg once daily

10 kg to <20 kg: 10 mg once daily

≥20 kg: 20 mg once daily

Dosing: Renal ImpairmentNo adjustment is necessary.

Dosing: Hepatic ImpairmentBioavailability is increased with chronic liver disease. Consider dosage adjustment for maintenance of erosive esophagitis ulcer healing. Specific guidelines are not available.

Administration: OralBest if taken before breakfast.

Capsule: Should be swallowed whole; do not chew or crush. Delayed release capsule may be opened and contents added to 1 tablespoon of applesauce (use immediately after adding to applesauce). Administration via NG tube should be in an acidic juice.

Tablet: Should be swallowed whole; do not crush or chew.

Dietary ConsiderationsShould be taken on an empty stomach; best if taken before breakfast.

StorageStore at 15°C to 30°C (59°F to 86°F). Protect from light and moisture.

Extemporaneously PreparedA 2 mg/mL oral omeprazole solution (Simplified Omeprazole Solution) can be prepared with five omeprazole 20 mg delayed release capsules and 50 mL 8.4% sodium bicarbonate. Empty capsules into beaker. Add sodium bicarbonate solution. Gently stir (about 15 minutes) until a white suspension is formed. Transfer to amber-colored syringe or bottle. Stable for 14 days at room temperature or for 30 days under refrigeration.

DiGiancinto JL, Olsen KM, Bergman KL, et al, “Stability of Suspension Formulations of Lansoprazole and Omeprazole Stored in Amber-Colored Plastic Oral Syringes,” *Ann Pharmacother*, 2000, 34:600-5.

Quercia R, Fan C, Liu X, et al, “Stability of Omeprazole in an Extemporaneously Prepared Oral Liquid,” *Am J Health Syst Pharm*, 1997, 54:1833-6.

Sharma V, “Comparison of 24-hour Intragastric pH Using Four Liquid Formulations of Lansoprazole and Omeprazole,” *Am J Health Syst Pharm*, 1999, 56(Suppl 4):S18-21.

Extemporaneous preparation for NG administration (Prilosec®): The manufacturer recommends the use of an acidic juice for preparation to administer via nasogastric (NG) tube. Alternative methods have been described as follows. NG tube administration for the prevention of stress-related mucosal damage in ventilated, critically-ill patients. The manufacturer makes no judgment regarding the safety or efficacy of these practices.

The contents of one or two 20 mg omeprazole delayed release capsules were poured into a syringe; 10-20 mL of an 8.4% sodium bicarbonate solution was withdrawn in the syringe; 30 minutes were allowed for the enteric-coated omeprazole granules to break down. The resulting milky substance was shaken prior to administration. The NG tube was then flushed with 5-10 mL of water and then clamped for at least 1 hour. Patients received omeprazole 40 mg once, then 40 mg 6-8 hours later, then 20 mg once daily using this technique.

Another study used a different technique. The omeprazole delayed release capsule (20 mg or 40 mg) was opened; then the intact granules were poured into a container holding 30 mL of water. With the plunger removed, $^1/_3$ to $^1/_2$ of the granules were then poured into a 30 mL syringe which was attached to a nasogastric tube (NG). The plunger was replaced with 1 cm of air between the granules and the plunger top while the plunger was depressed. This process was repeated until all the granules were flushed, then a final 15 mL of water was flushed through the tube. Patients who received omeprazole 40 mg in this manner had a more predictable increase in intragastric pH than patients who received omeprazole 20 mg.

ContraindicationsHypersensitivity to omeprazole, substituted benzimidazoles (ie, esomeprazole, lansoprazole, pantoprazole, rabeprazole), or any component of the formulation

Allergy Considerations

- Proton Pump Inhibitor, Benzimidazole Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Atrophic gastritis: Long-term omeprazole therapy has caused atrophic gastritis (by biopsy).
- Carcinoma: In long-term (2-year) studies in rats, omeprazole produced a dose-related increase in gastric carcinoid tumors. While available endoscopic evaluations and histologic examinations of biopsy specimens from human stomachs have not detected a risk from short-term exposure to omeprazole, further human data on the effect of sustained hypochlorhydria and hypergastrinemia are needed to rule out the possibility of an increased risk for the development of tumors in humans receiving long-term therapy.

Disease-related concerns:

- Gastric malignancy: Relief of symptoms does not preclude the presence of a gastric malignancy.
- Gastrointestinal infection (eg, *Salmonella, Campylobacter*): Use of proton pump inhibitors may increase risk of these infections.
- Hepatic impairment: Bioavailability may be increased in patients with hepatic dysfunction; consider dosage reductions.

Special populations:

- Asian ethnicity: Bioavailability may be increased in patients of Asian descent; consider dosage reductions.
- Elderly: Bioavailability may be increased in the elderly.
- Pediatrics: Safety and efficacy have not been established in children <1 year of age. OTC use is not approved for children <18 years of age.

Other warnings/precautions:

- Self-medication (OTC use): When used for self-medication (OTC), do not use for >14 days; treatment should not be repeated more often than every 4 months.

Geriatric ConsiderationsIn clinical trials, the incidence of side effects in the elderly is no different than that of younger adults (≤65 years) despite slight decrease in elimination and increase in bioavailability. Bioavailability may be increased in the elderly (≥65 years of age), however, dosage adjustments are not necessary.

Pregnancy Risk FactorC

Pregnancy ConsiderationsCrosses the placenta; congenital abnormalities have been reported sporadically following omeprazole use during pregnancy. Based on data collected by the Teratogen Information System (TERIS), it was concluded that therapeutic doses used during pregnancy would be unlikely to pose a substantial teratogenic risk (quantity/quality of data: fair). Because the possibility of harm still exists, the manufacturer recommends use during pregnancy only if the potential benefit to the mother outweighs the possible risk to the fetus.

LactationEnters breast milk/not recommended

Adverse Reactions

1% to 10%:

Central nervous system: Headache (3% to 7%), dizziness (2%)

Dermatologic: Rash (2%)

Gastrointestinal: Diarrhea (3% to 4%), abdominal pain (2% to 5%), nausea (2% to 4%), vomiting (2% to 3%), flatulence (≤3%), acid regurgitation (2%), constipation (1% to 2%), taste perversion

Neuromuscular & skeletal: Back pain (1%), weakness (1%)

Respiratory: Upper respiratory infection (2%), cough (1%)

1%, postmarketing, and/or case reports (adverse event occurrence may vary based on formulation): Abdominal swelling, abnormal dreams, aggression, agitation, agranulocytosis, alkaline phosphatase increased, allergic reactions, alopecia, ALT increased, AST increased, anaphylaxis, anemia, angina, angioedema, anorexia, anxiety, apathy, atrophic gastritis, benign gastric polyps, bilirubin increased, blurred vision, bradycardia, bronchospasm, chest pain, cholestatic hepatitis, confusion, creatinine increased, depression, diaphoresis, double vision, dry skin, epistaxis, erythema multiforme, esophageal candidiasis, fatigue, fecal discoloration, fever, gastroduodenal carcinoids, GGT increased, glycosuria, gynecomastia, hallucinations, hematuria, hemifacial dysesthesia, hemolytic anemia, hepatic encephalopathy, hepatic failure, hepatic necrosis, hepatitis, hepatocellular hepatitis, hyperhidrosis, hypersensitivity, hypertension, hypoglycemia, hyponatremia, insomnia, interstitial nephritis, irritable colon, jaundice, joint pain, leg pain, leukocytosis, leukopenia, liver disease (hepatocellular, cholestatic, mixed), malaise, microscopic pyuria, mucosal atrophy (tongue), muscle cramps, muscle weakness, myalgia, nervousness, neutropenia, ocular irritation, optic atrophy, optic neuritis, optic neuropathy (anterior ischemic), pain, palpitation, pancreatitis, pancytopenia, paresthesia, peripheral edema, petechiae, pharyngeal pain, photosensitivity, pneumothorax, proteinuria, pruritus, psychic disturbance, purpura, skin inflammation, sleep disturbance, somnolence, Stevens-Johnson syndrome, stomatitis, tachycardia, testicular pain, thrombocytopenia, tinnitus, toxic epidermal necrolysis, tremor, urinary frequency, urinary tract infection, urticaria, vertigo, weight gain, xerophthalmia, xerostomia

Metabolism/Transport Effects **Substrate** of CYP2A6 (minor), 2C9 (minor), 2C19 (major), 2D6 (minor), 3A4 (major); **Inhibits** CYP1A2 (weak), 2C9 (moderate), 2C19 (strong), 2D6 (weak), 3A4 (weak); **Induces** CYP1A2 (weak)

Drug Interactions

Atazanavir: Proton Pump Inhibitors may decrease the absorption of Atazanavir. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Proton Pump Inhibitors may increase the serum concentration of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Cilostazol: Omeprazole may enhance the adverse/toxic effect of Cilostazol. *Risk D: Consider therapy modification*

Clopidogrel: Proton Pump Inhibitors may diminish the therapeutic effect of Clopidogrel. This appears to be due to reduced formation of the active clopidogrel metabolite. *Risk C: Monitor therapy*

Clozapine: Omeprazole may decrease the serum concentration of Clozapine. Omeprazole may increase the serum concentration of Clozapine. *Risk C: Monitor therapy*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Substrates: CYP2C19 Inhibitors (Strong) may decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Moderate) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

Dabigatran Etexilate: Proton Pump Inhibitors may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Dasatinib: Proton Pump Inhibitors may decrease the absorption of Dasatinib. *Risk D: Consider therapy modification*

Erlotinib: Proton Pump Inhibitors may decrease the serum concentration of Erlotinib. *Risk X: Avoid combination*

Fluconazole: May increase the serum concentration of Proton Pump Inhibitors. *Risk C: Monitor therapy*

Indinavir: Proton Pump Inhibitors may decrease the serum concentration of Indinavir. *Risk C: Monitor therapy*

Iron Salts: Proton Pump Inhibitors may decrease the absorption of Iron Salts. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk C: Monitor therapy*

Itraconazole: Proton Pump Inhibitors may decrease the serum concentration of Itraconazole. *Risk D: Consider therapy modification*

Ketoconazole: Proton Pump Inhibitors may decrease the serum concentration of Ketoconazole. Ketoconazole may increase the serum concentration of Proton Pump Inhibitors. *Risk D: Consider therapy modification*

Mesalamine: Proton Pump Inhibitors may diminish the therapeutic effect of Mesalamine. This appears to be formulation-related and specific to the Apriso brand of mesalamine. Management: One specific formulation of mesalamine (i.e., Apriso-brand capsules containing coated granules) should not be administered with antacids; proton pump inhibitors would be expected to interact in a similar manner. *Risk X: Avoid combination*

Methotrexate: Proton Pump Inhibitors may decrease the excretion of Methotrexate. Antirheumatic doses of methotrexate probably hold minimal risk. *Risk C: Monitor therapy*

Mycophenolate: Proton Pump Inhibitors may decrease the serum concentration of Mycophenolate. Specifically, concentrations of the active mycophenolic acid may be reduced. *Risk C: Monitor therapy*

Nelfinavir: Proton Pump Inhibitors may decrease serum concentrations of the active metabolite(s) of Nelfinavir. Proton Pump Inhibitors may decrease the serum concentration of Nelfinavir. *Risk X: Avoid combination*

Phenytoin: Proton Pump Inhibitors may increase the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Saquinavir: Proton Pump Inhibitors may increase the serum concentration of Saquinavir. *Risk C: Monitor therapy*

Tipranavir: May decrease the serum concentration of Proton Pump Inhibitors. These data are derived from studies with Ritonavir-boosted Tipranavir. *Risk C: Monitor therapy*

Voriconazole: Proton Pump Inhibitors may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Warfarin: Proton Pump Inhibitors may increase the serum concentration of Warfarin. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may cause gastric mucosal irritation).

Food: Food delays absorption.

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions (especially those dependent on cytochrome P450 metabolism or those dependent on a acid environment for absorption). Monitor therapeutic effectiveness and adverse reactions at beginning of therapy and periodically throughout therapy. Assess knowledge/teach appropriate use of this medication, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake as directed, before eating. Do not crush or chew capsules. Delayed release capsule may be opened and contents added to applesauce. Avoid alcohol. You may experience anorexia; small frequent meals may help to maintain adequate nutrition. Report severe headache or unresolved severe diarrhea. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, delayed release: 10 mg, 20 mg, 40 mg

Prilosec®: 10 mg, 20 mg, 40 mg

Tablet, delayed release: 20 mg

Prilosec OTC™: 20 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsule, delayed release (Omeprazole)

10 mg (30): $32.99

20 mg (90): $63.97

40 mg (30): $169.99

Capsule, delayed release (Prilosec)

20 mg (30): $148.70

40 mg (30): $224.95

Tablet, EC (Prilosec OTC)

20 mg (14): $19.99

Mechanism of ActionProton pump inhibitor; suppresses gastric basal and stimulated acid secretion by inhibiting the parietal cell H+/K+ ATP pump

Pharmacodynamics/Kinetics

Onset of action: Antisecretory: ~1 hour

Peak effect: Within 2 hours

Duration: Up to 72 hours; 50% of maximum effect at 24 hours

Absorption: Rapid

Protein binding: ~95%

Metabolism: Extensively hepatic by cytochrome P450 system to inactive metabolites

Bioavailability: Oral: ~30% to 40%; increased in Asian patients and patients with hepatic dysfunction

Half-life elimination: Delayed release capsule: 0.5-1 hour; hepatic impairment: ~3 hours

Time to peak, plasma: 0.5-3.5 hours

Excretion: Urine (77% as metabolites, very small amount as unchanged drug); feces

Related Information

- ***Helicobacter pylori*** Treatment

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Taste perversion, dry mouth, esophageal candidiasis, and mucosal atrophy (tongue).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, agitation, aggression, depression, confusion, insomnia, nervousness, anxiety, or hallucinations; may rarely cause sedation

Mental Health: Effects on Psychiatric TreatmentMay inhibit the metabolism of diazepam; monitor for increased sedation

Anesthesia and Critical Care Concerns/Other Considerations

Clinical Pearls/Comments: A 2 mg/mL oral omeprazole solution (Simplified Omeprazole Solution) can be prepared with five omeprazole 20 mg delayed release capsules and 50 mL 8.4% sodium bicarbonate. Empty capsules into beaker. Add sodium bicarbonate solution. Gently stir (about 15 minutes) until a white suspension is formed. Transfer to amber-colored syringe or bottle. Stable for 14 days at room temperature or for 30 days under refrigeration.

Evidence-Based Information: The 2008 Surviving Sepsis Campaign guidelines recommend that stress ulcer prophylaxis using an H_2 blocker (Grade 1A) or proton pump inhibitor (Grade 1B) be given to patients with severe sepsis to prevent upper GI bleed. Benefit of prevention of upper GI bleed must be weighed against potential effect of increased stomach pH on development of ventilator-associated pneumonia.

Ondansetron

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Ondansetron may be confused with dolasetron, granisetron, palonosetron

Zofran® may be confused with Zantac®, Zosyn®

Pronunciation(on DAN se tron)

U.S. Brand NamesZofran®; Zofran® ODT

Canadian Brand NamesApo-Ondansetron®; DOM-Ondansetron; Gen-Ondansetron; JAMP-Ondansetron; MINT-Ondansetron; Novo-Ondansetron; Ondansetron Injection; Ondansetron-Omega; PHL-Ondansetron; PMS-Ondansetron; RAN-Ondansetron; RATIO-Ondansetron; Sandoz-Ondansetron; Zofran®; Zofran® ODT

Pharmacologic CategoryAntiemetic; Selective 5-HT$_3$ Receptor Antagonist

Use: Labeled IndicationsPrevention of nausea and vomiting associated with moderately- to highly-emetogenic cancer chemotherapy; radiotherapy in patients receiving total body irradiation or fractions to the abdomen; prevention of postoperative nausea and vomiting (PONV); treatment of PONV if no prophylactic dose received

Use: Unlabeled/InvestigationalTreatment of early-onset alcoholism; hyperemesis gravidarum

Dosing: Adults **Note:** Studies in adults have shown a single daily dose of 8-12 mg I.V. or 8-24 mg orally to be as effective as mg/kg dosing, and should be considered for **all** patients whose mg/kg dose exceeds 8-12 mg I.V.; oral solution and ODT formulations are bioequivalent to corresponding doses of tablet formulation.

Prevention of chemotherapy-induced emesis:

I.V.:

0.15 mg/kg 3 times/day beginning 30 minutes prior to chemotherapy **or**

0.45 mg/kg once daily **or**

8-10 mg 1-2 times/day **or**

24 mg or 32 mg once daily

Highly-emetogenic agents/single-day therapy: Oral: 24 mg given 30 minutes prior to the start of therapy

Moderately-emetogenic agents: Oral: 8 mg every 12 hours beginning 30 minutes before chemotherapy, continuously for 1-2 days after chemotherapy completed

Total body irradiation: Oral: 8 mg 1-2 hours before each daily fraction of radiotherapy

Single high-dose fraction radiotherapy to abdomen: Oral: 8 mg 1-2 hours before irradiation, then 8 mg every 8 hours after first dose for 1-2 days after completion of radiotherapy

Daily fractionated radiotherapy to abdomen: 8 mg 1-2 hours before irradiation, then 8 mg 8 hours after first dose for each day of radiotherapy

Postoperative nausea and vomiting (PONV):

Oral: 16 mg given one hour prior to induction of anesthesia

I.M., I.V.: 4 mg as a single dose immediately before induction of anesthesia, or shortly following procedure if vomiting occurs

Note: Repeat doses given in response to inadequate control of nausea/vomiting from preoperative doses are generally ineffective.

Treatment of hyperemesis gravidum (unlabeled use):

Oral: 8 mg every 12 hours

I.V.: 8 mg administered over 15 minutes every 12 hours or 1 mg/hour infused continuously for up to 24 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric **Note:** Studies in adults have shown a single daily dose of 8-12 mg I.V. or 8-24 mg orally to be as effective as mg/kg dosing, and should be considered for **all** patients whose mg/kg dose exceeds 8-12 mg I.V.; oral solution and ODT formulations are bioequivalent to corresponding doses of tablet formulation.

Prevention of chemotherapy-induced emesis:

I.V.: Children 6 months to 18 years: 0.15 mg/kg/dose administered 30 minutes prior to chemotherapy, 4 and 8 hours after the first dose **or** 0.45 mg/kg/day as a single dose

Oral:

4-11 years: 4 mg 30 minutes before chemotherapy; repeat 4 and 8 hours after initial dose, then 4 mg every 8 hours for 1-2 days after chemotherapy completed

≥12 years: Refer to adult dosing.

Prevention of postoperative nausea and vomiting (PONV): I.V.: Children 1 month to 12 years:

≤40 kg: 0.1 mg/kg as a single dose

>40 kg: 4 mg as a single dose

Dosing: Renal ImpairmentNo adjustment is necessary.

Dosing: Hepatic ImpairmentSevere liver disease (Child-Pugh C): Maximum daily dose: 8 mg

Administration: I.M.Should be given undiluted.

Administration: I.V.

IVPB: Dilute in 50 mL D_5W or NS. Infuse over 15-30 minutes; 24-hour continuous infusions have been reported, but are rarely used.

Chemotherapy-induced nausea and vomiting: Give first dose 30 minutes prior to beginning chemotherapy.

I.V. push: Prevention of postoperative nausea and vomiting: Single doses may be administered I.V. injection over 2-5 minutes as undiluted solution.

Administration: I.V. DetailpH: 3-4

Administration: OralOral dosage forms should be given 30 minutes prior to chemotherapy; 1-2 hours before radiotherapy; 1 hour prior to the induction of anesthesia.

Orally-disintegrating tablets: Do not remove from blister until needed. Peel backing off the blister, do not push tablet through. Using dry hands, place tablet on tongue and allow to dissolve. Swallow with saliva.

The I.V. preparation has been successful when administered orally.

Dietary ConsiderationsTake without regard to meals.

Orally-disintegrating tablet contains <0.03 mg phenylalanine

Storage

Oral solution: Store between 15°C and 30°C (59°F and 86°F). Protect from light.

Premixed bag: Store between 2°C and 30°C (36°F and 86°F). Protect from light.

Tablet: Store between 2°C and 30°C (36°F and 86°F).

Vial: Store between 2°C and 30°C (36°F and 86°F). Protect from light. Stable when mixed in D_5W or NS for 48 hours at room temperature.

ReconstitutionPrior to I.V. infusion, dilute in 50 mL D_5W or NS.

CompatibilityStable in $D_5{}^1/_2$NS, D_5NS, D_5W, mannitol 10%, LR, NS, sodium chloride 3%; do not mix injection with alkaline solutions.

Y-site administration: Compatible: Alatrofloxacin, aldesleukin, amifostine, amikacin, aztreonam, bleomycin, carboplatin, carmustine, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, cefuroxime, chlorpromazine, cimetidine, cisatracurium, cisplatin, cladribine, clindamycin, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daunorubicin, dexamethasone sodium phosphate, diphenhydramine, docetaxel, dopamine, doxorubicin, doxorubicin liposome, doxycycline, droperidol, etoposide, etoposide phosphate, famotidine, filgrastim, floxuridine, fluconazole, fludarabine, gatifloxacin, gemcitabine, gentamicin, haloperidol, heparin, hydrocortisone sodium phosphate, hydrocortisone sodium succinate, hydromorphone, hydroxyzine, ifosfamide, imipenem/cilastatin, linezolid, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, mesna, methotrexate, metoclopramide, mitomycin, mitoxantrone, morphine, paclitaxel, paclitaxel with ranitidine, pentostatin, piperacillin/tazobactam, potassium chloride, prochlorperazine edisylate, promethazine, ranitidine, remifentanil, sodium acetate, streptozocin, teniposide, thiotepa, ticarcillin, ticarcillin/clavulanate, topotecan, vancomycin, vinblastine, vincristine, vinorelbine, zidovudine. **Incompatible:** Acyclovir, allopurinol, aminophylline, amphotericin B, amphotericin B cholesteryl sulfate complex, ampicillin, ampicillin/sulbactam, amsacrine, cefepime, cefoperazone, furosemide, ganciclovir, lorazepam, methylprednisolone sodium succinate, piperacillin, sargramostim, sodium bicarbonate. **Variable (consult detailed reference):** Fluorouracil, meropenem.

Extemporaneously PreparedA 0.8 mg/mL syrup may be made by crushing ten 8 mg tablets; flaking of the tablet coating occurs. Mix thoroughly with 50 mL of the suspending vehicle, Ora-Plus® (Paddock), in 5 mL increments. Add sufficient volume of any of the following syrups: Cherry syrup USP, Syrpalta® (Humco), Ora-Sweet® (Paddock), or Ora-Sweet® Sugar-Free (Paddock) to make a final volume of 100 mL. Stability is 42 days refrigerated.

Trissel LA, “Trissel's Stability of Compounded Formulations,” American Pharmaceutical Association, 1996.

Rectal suppositories: Calibrate a suppository mold for the base being used. Determine the displacement factor (DF) for ondansetron for the base being used (Fattibase® = 1.1; Polybase® = 0.6). Weigh the ondansetron tablet. Divide the tablet weight by the DF. Subtract the weight of base displaced from the calculated weight of base required for each suppository. Grind the ondansetron tablets to a fine powder in a mortar. Weigh out the appropriate weight of suppository base. Melt the base over a water bath (<55°C). Add the ondansetron powder to the suppository base and mix well. Pour the mixture into the suppository mold and cool. Stable for at least 30 days under refrigeration.

Allen LV, “Ondansetron Suppositories,” *US Pharm*, 20(7):84-6.

ContraindicationsHypersensitivity to ondansetron, other selective 5-HT$_3$ antagonists, or any component of the formulation

Allergy Considerations

- Serotonin 5-HT$_3$ Antagonist Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Allergic reactions: Use with caution in patients allergic to other 5-HT$_3$ receptor antagonists; cross-reactivity has been reported.
- ECG effects: Selective 5-HT$_3$ antagonists, including ondansetron, have been associated with a number of dose-dependent increases in ECG intervals (eg, PR, QRS duration, QT/QT$_c$, JT), usually occurring 1-2 hours after I.V. administration. In general, these changes are not clinically relevant, however, when used in conjunction with other agents that prolong these intervals, arrhythmia may occur. When used with agents that prolong the QT interval (eg, Class I and III antiarrhythmics), clinically relevant QT interval prolongation may occur resulting in torsade de pointes. A number of trials have shown that 5-HT$_3$ antagonists produce QT interval prolongation to variable degrees. Use with caution in patients at risk of QT prolongation and/or ventricular arrhythmia. Reduction in heart rate may also occur with the 5-HT$_3$ antagonists. I.V. formulations of 5-HT$_3$ antagonists have more association with ECG interval changes, compared to oral formulations.

Disease-related concerns:

- Long QT syndrome: Use with caution in patients with congenital long QT syndrome or other risk factors for QT prolongation (eg, medications known to prolong QT interval, electrolyte abnormalities [hypokalemia or hypomagnesemia], and cumulative high-dose anthracycline therapy).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <1 month of age.

Dosage form specific issues:

- Phenylalanine: Orally-disintegrating tablets contain phenylalanine.

Other warnings/precautions:

- Chemotherapy-related emesis: **For chemotherapy, should be used on a scheduled basis, not on an "as needed" (PRN) basis,** since data support the use of this drug only in the prevention of nausea and vomiting (due to antineoplastic therapy) and not in the rescue of nausea and vomiting. Should only be used in the first 24-48 hours of chemotherapy. Data does not support any increased efficacy in delayed nausea and vomiting.
- Ileus or gastric distention: Does not stimulate gastric or intestinal peristalsis; may mask progressive ileus and/or gastric distension.

Geriatric ConsiderationsElderly have a slightly decreased hepatic clearance rate. This does not, however, require a dose adjustment.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies; however, there are no adequate and well-controlled studies in pregnant women. Use of ondansetron for the treatment of nausea and vomiting of pregnancy (NVP) has been evaluated. Additional studies are needed to determine safety to the fetus, particularly during the first trimester. Based on preliminary data, use is generally reserved for severe NVP (hyperemesis gravidarum) or when conventional treatments are not effective.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions**Note:** Percentages reported in adult patients.

>10%:

Central nervous system: Headache (9% to 27%), malaise/fatigue (9% to 13%)

Gastrointestinal: Constipation (6% to 11%)

1% to 10%:

Central nervous system: Drowsiness (8%), fever (2% to 8%), dizziness (4% to 7%), anxiety (6%), cold sensation (2%)

Dermatologic: Pruritus (2% to 5%), rash (1%)

Gastrointestinal: Diarrhea (2% to 7%)

Genitourinary: Gynecological disorder (7%), urinary retention (5%)

Hepatic: ALT increased (1% to 5%), AST increased (1% to 5%)

Local: Injection site reaction (4%; pain, redness, burning)

Neuromuscular & skeletal: Paresthesia (2%)

Respiratory: Hypoxia (9%)

<1%: Anaphylaxis, angina, bronchospasm, ECG changes, extrapyramidal symptoms, grand mal seizure, hypokalemia, tachycardia, vascular occlusive events

Postmarketing and/or case reports: Anaphylactoid reactions, angioedema, arrhythmia, blindness (transient/following infusion; lasting ≤48 hours), blurred vision (transient/following infusion), bradycardia, cardiopulmonary arrest, dyspnea, dystonic reaction, electrocardiographic alterations (second-degree heart block and ST-segment depression), flushing, hiccups, hypersensitivity reaction, hypotension, laryngeal edema, laryngospasm, oculogyric crisis, palpitation, premature ventricular contractions (PVC), QT interval increased, shock, stridor, supraventricular tachycardia, syncope, urticaria, ventricular arrhythmia

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Metabolism/Transport Effects**Substrate** of CYP1A2 (minor), 2C9 (minor), 2D6 (minor), 2E1 (minor), 3A4 (major); **Inhibits** CYP1A2 (weak), 2C9 (weak), 2D6 (weak)

Drug Interactions

Apomorphine: Antiemetics (5HT3 Antagonists) may enhance the hypotensive effect of Apomorphine. *Risk X: Avoid combination*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Antiemetics (5HT3 Antagonists). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Food increases the extent of absorption. The C_{max} and T_{max} do not change much.

Herb/Nutraceutical: St John's wort may decrease ondansetron levels.

Monitoring ParametersClosely monitor patients <4 months of age

Nursing: Physical Assessment/MonitoringAssess allergy history (selective 5-HT_3 receptor antagonists) prior to administering. Use with caution in presence of, or potential for, cardiac conduction abnormalities (eg, QT prolongation, medication known to prolong QT interval, electrolyte abnormalities). Follow specific administration specifics according to formulation. **Note:** Oral and I.V. doses have different schedules and should not be administered on "PRN" basis. Assess therapeutic effectiveness and adverse reactions on a regular basis. Teach patient possible side effects and adverse symptoms to report.

Patient EducationThis drug is given to reduce the incidence of nausea and vomiting. Do not take any other medication for nausea and vomiting with this medication unless approved by prescriber. If this medication is given by intravenous infusion you will be monitored during infusion. Report immediately any chest pain, respiratory difficulty, pain or itching at infusion site. Self-administered oral doses must be taken exactly as directed. If self-administered, take as directed. May cause headache, drowsiness, or dizziness (request assistance when getting up or changing position and do not perform activities requiring alertness [including driving] until response to drug is known). Report chest pain or palpitations; persistent headache; excessive drowsiness; fever; or changes in elimination patterns (constipation or diarrhea) or other adverse effects. **Breast-feeding precaution:** Consult prescriber if you are or intend to breast-feed.

Orally-disintegrating tablets: Do not remove from blister until needed. Peel backing off the blister, do not push tablet through. Using dry hands, place tablet on tongue and allow to dissolve. Swallow with saliva.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Infusion, premixed in D_5 [preservative free]: 32 mg (50 mL)

Zofran®: 32 mg (50 mL) [DSC]

Injection, solution: 2 mg/mL (2 mL, 20 mL)

Zofran®: 2 mg/mL (2 mL, 20 mL)

Injection, solution [preservative free]: 2 mg/mL (2 mL)

Solution, oral: 4 mg/5 mL (50 mL)

Zofran®: 4 mg/5 mL (50 mL) [contains sodium benzoate; strawberry flavor]

Tablet: 4 mg; 8 mg

Zofran®: 4 mg; 8 mg

Tablet, orally disintegrating: 4 mg; 8 mg

Zofran® ODT: 4 mg, 8 mg [each strength contains phenylalanine <0.03 mg/tablet; strawberry flavor]

Generic AvailableYes

ManufacturerGlaxoSmithKline

Pricing: U.S. (www.drugstore.com)

Tablet, orally-disintegrating (Ondansetron)

4 mg (30): $549.00

Tablet, orally-disintegrating (Zofran ODT)

4 mg (30): $659.95

Tablets (Ondansetron HCl)

4 mg (30): $569.96

8 mg (30): $1048.95

Tablets (Zofran)

4 mg (10): $244.63

8 mg (30): $1169.97

24 mg (10): $1008.41

Mechanism of ActionSelective 5-HT$_3$-receptor antagonist, blocking serotonin, both peripherally on vagal nerve terminals and centrally in the chemoreceptor trigger zone

Pharmacodynamics/Kinetics

Onset of action: ~30 minutes

Distribution: V$_d$: Children: 1.7-3.7 L/kg; Adults: 2.2-2.5 L/kg

Protein binding, plasma: 70% to 76%

Metabolism: Extensively hepatic via hydroxylation, followed by glucuronide or sulfate conjugation; CYP1A2, CYP2D6, and CYP3A4 substrate; some demethylation occurs

Bioavailability: Oral: 56% to 71%; Rectal: 58% to 74%

Half-life elimination: Children <15 years: 2-7 hours; Adults: 3-6 hours

Mild-to-moderate hepatic impairment: Adults: 12 hours

Severe hepatic impairment (Child-Pugh C): Adults: 20 hours

Time to peak: Oral: ~2 hours

Excretion: Urine (44% to 60% as metabolites, 5% to 10% as unchanged drug); feces (~25%)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentBarbiturates and carbamazepine may increase the metabolism of ondansetron; monitor for diminished effects

Index TermsGR38032R; Ondansetron Hydrochloride

Opium Tincture

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Opium tincture may be confused with camphorated tincture of opium (paregoric)

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Use care when prescribing opium tincture; each mL contains the equivalent of morphine 10 mg; paregoric contains the equivalent of morphine 0.4 mg/mL

DTO is an error-prone abbreviation (mistaken as Diluted Tincture of Opium; dose equivalency of paregoric)

Pronunciation(OH pee um TING chur)

Pharmacologic Category[Analgesic, Opioid](); [Antidiarrheal]()

Use: Labeled IndicationsTreatment of diarrhea or relief of pain

Dosing: Adults**Note:** Opium tincture 10% contains morphine 10 mg/mL. Use caution in ordering, dispensing, and/or administering.

Diarrhea: Oral: 0.3-1 mL/dose every 2-6 hours to maximum of 6 mL/24 hours

Analgesia: Oral: 0.6-1.5 mL/dose every 3-4 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Opium tincture 10% contains morphine 10 mg/mL. Use caution in ordering, dispensing, and/or administering.

Diarrhea: Oral: Children: 0.005-0.01 mL/kg/dose every 3-4 hours for a maximum of 6 doses/24 hours

Analgesia: Oral: Children: 0.01-0.02 mL/kg/dose every 3-4 hours

StorageProtect from light.

RestrictionsC-II

ContraindicationsHypersensitivity to morphine sulfate or any component of the formulation; increased intracranial pressure; severe respiratory depression; severe hepatic or renal insufficiency; pregnancy (prolonged use or high dosages near term)

Allergy Considerations

- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hypotension: May cause hypotension; use with caution in patients with hypovolemia, cardiovascular disease (including acute MI), or with drugs which may exaggerate hypotensive effects (including phenothiazines or general anesthetics).

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.
- Biliary tract impairment: Use with caution in patients with biliary tract dysfunction; acute pancreatitis may cause constriction of sphincter of Oddi.
- CNS depression/coma: Use with caution in patients with CNS depression or coma.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.
- Hepatic impairment: Use with caution in patients with severe hepatic dysfunction.

- Obesity: Use with caution in patients who are morbidly obese.

- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.

- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorders which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.

- Pediatrics: Infants <3 months of age are more susceptible to respiratory depression; use with caution and generally in reduced doses in this age group.

Dosage form specific issues:

- Sulfites: Some preparations contain sulfites which may cause allergic reactions.

Other warnings/precautions:

- Not paregoric: This is **not** paregoric, dose accordingly.

- Withdrawal: Concurrent use of agonist/antagonist analgesics may precipitate withdrawal symptoms and/or reduced analgesic efficacy in patients following prolonged therapy with mu opioid agonists. Abrupt discontinuation following prolonged use may also lead to withdrawal symptoms.

Pregnancy Risk FactorB/D (prolonged use or high doses at term)
LactationEnters breast milk/use caution
Adverse ReactionsFrequency not defined.

Cardiovascular: Palpitation, hypotension, bradycardia, peripheral vasodilation

Central nervous system: Drowsiness, dizziness, restlessness, headache, malaise, CNS depression, intracranial pressure increased, insomnia, mental depression

Gastrointestinal: Nausea, vomiting, constipation, anorexia, stomach cramps, biliary tract spasm

Genitourinary: Urination decreased, urinary tract spasm

Neuromuscular & skeletal: Weakness

Ocular: Miosis

Respiratory: Respiratory depression

Miscellaneous: Histamine release, physical and psychological dependence

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Test InteractionsIncreased aminotransferase [ALT/AST] (S)

Monitoring ParametersObserve patient for excessive sedation, respiratory depression, implement safety measures, assist with ambulation

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for additive or adverse interactions. Monitor vital signs, effectiveness of pain relief, adverse reactions, and signs of overdose at beginning of therapy and at regular intervals with long-term use. May cause physical and/or psychological dependence. For inpatients, implement safety measures. Assess knowledge/teach patient appropriate use (if self-administered). Teach patient to monitor for adverse reactions, adverse reactions to report, and appropriate interventions to reduce side effects. Discontinue slowly after prolonged use.

Patient EducationIf self-administered, use exactly as directed; do not increase dose or frequency. Drug may cause physical and/or psychological dependence. While using this medication, do not use alcohol and other prescription or OTC medications (especially sedatives, tranquilizers, antihistamines, or pain medications) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids). May cause hypotension, dizziness, drowsiness, impaired coordination, or blurred vision (use caution when driving, climbing stairs, or changing position - rising from sitting or lying to standing, or when engaging in tasks requiring alertness until response to drug is known); or dry mouth (frequent mouth care, small frequent meals, chewing gum, or sucking lozenges may help). Report slow or rapid heartbeat, acute dizziness, or persistent headache; changes in mental status; swelling of extremities or unusual weight gain; changes in urinary elimination or pain on urination; acute headache; trembling or muscle spasms; blurred vision; skin rash; or shortness of breath. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Liquid: 10% (120 mL, 480 mL) [0.6 mL equivalent to morphine 6 mg; contains alcohol 19%]

Generic AvailableYes

Mechanism of ActionContains many narcotic alkaloids including morphine; its mechanism for gastric motility inhibition is primarily due to this morphine content; it results in a decrease in digestive secretions, an increase in GI muscle tone, and therefore a reduction in GI propulsion

Pharmacodynamics/Kinetics

Duration: 4-5 hours

Absorption: Variable

Metabolism: Hepatic

Excretion: Urine

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness and drowsiness are common; may cause restlessness; may rarely cause insomnia or depression

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may alter the analgesic effects of opioids; monitor for altered response

Index TermsDTO (error-prone abbreviation); Opium Tincture, Deodorized

Oprelvekin

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Oprelvekin may be confused with aldesleukin, Proleukin®

Neumega® may be confused with Neulasta®, Neupogen®

Pronunciation(oh PREL ve kin)

U.S. Brand NamesNeumega®

Pharmacologic CategoryBiological Response Modulator; Human Growth Factor

Use: Labeled IndicationsPrevention of severe thrombocytopenia; reduce the need for platelet transfusions following myelosuppressive chemotherapy

Dosing: Adults

Prevention of thrombocytopenia: SubQ: 50 mcg/kg once daily for ~10-21 days (until postnadir platelet count ≥50,000 cells/µL)

Administer first dose ~6-24 hours after the end of chemotherapy. Discontinue at least 48 hours before beginning the next cycle of chemotherapy.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Prevention of thrombocytopenia (unlabeled use): SubQ: 75-100 mcg/kg once daily for 10-21 days (until postnadir platelet count ≥50,000 cells/µL). **Note:** A safe and effective dose for use in children has not been established by the manufacturer.

Administer first dose ~6-24 hours after the end of chemotherapy. Discontinue at least 48 hours before beginning the next cycle of chemotherapy.

Administration: I.V. DetailpH: 7

Administration: OtherSubcutaneously in the abdomen, thigh, hip, or upper arm.

StorageStore vials under refrigeration between 2°C to 8°C (36°F to 46°F); do not freeze. Protect from light. Use reconstituted oprelvekin within 3 hours of reconstitution and store in the vial at either 2°C to 8°C (36°F to 46°F) or room temperature of ≤25°C (77°F). Do not freeze or shake reconstituted solution.

ReconstitutionReconstitute to a final concentration of 5 mg/mL with SWFI; swirl gently, do not shake.

ContraindicationsHypersensitivity to oprelvekin or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Anaphylactoid/hypersensitivity reactions: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: **[U.S. Boxed Warning]: Allergic or hypersensitivity reactions, including anaphylaxis have been reported. May occur with the first or with subsequent doses. Permanently discontinue in any patient developing an allergic reaction.**

- Cardiovascular effects: Arrhythmia, pulmonary edema, and cardiac arrest have been reported; use in patients with a history of atrial arrhythmia only if the potential benefit exceeds possible risks. Patients experiencing arrhythmia may be at risk for stroke; use caution in patients with a history of transient ischemic attack or stroke. Ventricular arrhythmia has also been reported, occurring within 2-7 days of treatment initiation; use with caution in patients with conduction defects.

- Fluid retention: May cause serious fluid retention; use cautiously in patients with conditions where expansion of plasma volume should be avoided (eg, left ventricular dysfunction, HF, hypertension).

- Papilledema: Dose limiting papilledema, more frequently associated with use in children, has occurred; use with caution in patients with pre-existing papilledema or with tumors involving the central nervous system. Patients experiencing oprelvekin-related papilledema may be at risk for visual acuity changes, including blurred vision or blindness.

Disease-related concerns:

- Ascites/pericardial effusion: Use with caution in patients with pre-existing pericardial effusions or ascites.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with respiratory disease.
- Thromboembolic disease: Use with caution in patients with a history of stroke or thromboembolic problems.

Concurrent drug therapy issues:

- Chemotherapy regimens: Efficacy has not been established with chemotherapy regimens >5 days duration or with regimens associated with delayed myelosuppression (eg, nitrosoureas, mitomycin C). Not indicated following myeloablative chemotherapy; increased toxicities were reported when used following myeloablative therapy.
- Diuretics: Closely monitor fluid and electrolytes in patient on chronic diuretic therapy; severe hypokalemia contributing to sudden death have been reported in these patients.

Special populations:

- Pediatrics: Although used in children in clinical trials, safety and efficacy have not been established in children.

Other warnings/precautions:

- Chronic administration: Safety and efficacy have not been established with chronic administration.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies have demonstrated adverse fetal effects. There are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if the potential benefits outweigh the potential risk to the fetus.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.

Adverse Reactions

>10%:

Cardiovascular: Tachycardia (children 84%; adults 20%), edema (59%), palpitation (14%), cardiomegaly (children 21%), vasodilation (19%), syncope (13%), atrial arrhythmia (12%)

Central nervous system: Headache (41%), dizziness (38%), fever (36%), insomnia (33%), fatigue (30%)

Dermatologic: Rash (25%)

Endocrine & metabolic: Fluid retention

Gastrointestinal: Nausea/vomiting (77%), diarrhea (43%), oral moniliasis (14%)

Hematologic: Anemia (dilutional); appears within 3 days of initiation of therapy, resolves in about 1 week after cessation of oprelvekin

Neuromuscular & skeletal: Weakness (severe 14%), arthralgia, periostitis (children 11%)

Ocular: Conjunctival injection/redness/swelling (children 57%; adults 19%), papilledema (children 16%; adults 1%)

Respiratory: Dyspnea (48%), rhinitis (42%), cough (29%), pharyngitis (25%)

1% to 10%:

Gastrointestinal: Weight gain (5%)

Respiratory: Pleural effusion (10%)

Postmarketing and/or case reports: Allergic reaction, amblyopia, anaphylaxis/anaphylactoid reactions, blindness, blurred vision, capillary leak syndrome, CHF, dehydration, exfoliative dermatitis, eye hemorrhage, facial edema, fibrinogen increased, fluid overload, hypoalbuminemia, hypocalcemia, hypotension, injection site reactions (dermatitis, pain, discoloration), optic neuropathy, paresthesia, pericardial effusion, pulmonary edema, renal failure, skin discoloration, stroke, ventricular arrhythmia

Oncology: VesicantNo

Oncology: Emetic PotentialModerate (30% to 60%)

Drug InteractionsThere are no known significant interactions.

Test InteractionsDecrease in hemoglobin concentration, serum concentration of albumin and other proteins (result of expansion of plasma volume)

Monitoring ParametersMonitor electrolytes and fluid balance during therapy; obtain a CBC at regular intervals during therapy; monitor platelet counts until adequate recovery has occurred

Monitoring: Lab TestsMonitor electrolytes and fluid balance during therapy; obtain a CBC at regular intervals during therapy; monitor platelet counts until adequate recovery has occurred

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Neumega®: 5 mg [packaged with diluent]

Generic AvailableNo

ManufacturerGenetics Institute

Mechanism of ActionOprelvekin is a growth factor which stimulates multiple stages of megakaryocytopoiesis and thrombopoiesis, resulting in proliferation of megakaryocyte progenitors and megakaryocyte maturation, or increased platelet production.

Pharmacodynamics/Kinetics

Bioavailability: >80%

Half-life elimination: Terminal: 5-9 hours

Time to peak, serum: 1-6 hours

Excretion: Urine (primarily as metabolites)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Oral moniliasis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness, insomnia, and fatigue are common

Mental Health: Effects on Psychiatric TreatmentAnemia is common; use caution with clozapine and carbamazepine

International Brand NamesNeumega (BR, CO, IL, MX)

Orlistat

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Xenical® may be confused with Xeloda®

Pronunciation(OR li stat)

U.S. Brand NamesAlli™ [OTC]; Xenical®

Canadian Brand NamesXenical®

Pharmacologic CategoryLipase Inhibitor

Use: Labeled IndicationsManagement of obesity, including weight loss and weight management, when used in conjunction with a reduced-calorie and low-fat diet; reduce the risk of weight regain after prior weight loss; indicated for obese patients with an initial body mass index (BMI) ≥30 kg/m^2 or ≥27 kg/m^2 in the presence of other risk factors

Dosing: Adults**Obesity:** Oral:

Xenical®: 120 mg 3 times/day with each main meal containing fat (during or up to 1 hour after the meal); omit dose if meal is occasionally missed or contains no fat.

Alli™: OTC labeling: 60 mg 3 times/day with each main meal containing fat

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Obesity (Xenical®):** Children ≥12 years: Refer to adult dosing.

Dietary ConsiderationsMultivitamin supplements that contain fat-soluble vitamins should be taken once daily at least 2 hours before or after the administration of orlistat (ie, bedtime). Distribute the daily intake of fat over 3 main meals. Gastrointestinal effects of orlistat may increase if taken with any 1 meal very high in fat.

StorageStore at 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to orlistat or any component of the formulation; chronic malabsorption syndrome or cholestasis

Warnings/Precautions

Concerns related to adverse effects:

- Increased urinary oxalate: Some patients may develop increased levels of urinary oxalate following treatment; caution should be exercised when prescribing it to patients with a history of hyperoxaluria or calcium oxalate nephrolithiasis.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Other warnings/precautions:

- Dietary guidelines: Patients should be advised to adhere to dietary guidelines; gastrointestinal adverse events may increase if taken with a diet high in fat (>30% total daily calories from fat). The daily intake of fat should be distributed over three main meals. If taken with any one meal very high in fat, the possibility of gastrointestinal effects increases. Patients should be counseled to take a multivitamin supplement that contains fat-soluble vitamins to ensure adequate nutrition because orlistat has been shown to reduce the absorption of some fat-soluble vitamins and beta-carotene.

- OTC labeling: Prior to use, patients should contact their healthcare provider if they have ever had kidney stones, gall bladder disease, or pancreatitis. Patients taking medications for diabetes or thyroid disease, anticoagulants, or other weight-loss products should consult their healthcare provider or pharmacist. Patients who have had an organ transplant should not use orlistat. If severe and/or continuous abdominal pain occurs, use should be discontinued and healthcare provider consulted.

- Long-term therapy: Safety and efficacy have not been established with use >4 years.

- Potential for misuse: As with any weight-loss agent, the potential exists for misuse in appropriate patient populations (eg, patients with anorexia nervosa or bulimia).

Pregnancy Risk FactorB

Pregnancy ConsiderationsThere are no adequate and well-controlled studies of orlistat in pregnant women. Because animal reproductive studies are not always predictive of human response, orlistat is not recommended for use during pregnancy. Teratogenicity studies were conducted in rats and rabbits at doses up to 800 mg/kg/day. Neither study showed embryotoxicity or teratogenicity. This dose is 23 and 47 times the daily human dose calculated on a body surface area basis for rats and rabbits, respectively.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%:

Central nervous system: Headache (31%)

Gastrointestinal: Oily spotting (27%), abdominal pain/discomfort (26%), flatus with discharge (24%), fecal urgency (22%), fatty/oily stool (20%), oily evacuation (12%), defecation increased (11%)

Neuromuscular & skeletal: Back pain (14%)

Respiratory: Upper respiratory infection (38%)

1% to 10%:

Central nervous system: Fatigue (7%), anxiety (5%), sleep disorder (4%)

Dermatologic: Dry skin (2%)

Endocrine & metabolic: Menstrual irregularities (10%)

Gastrointestinal: Fecal incontinence (8%), nausea (8%), infectious diarrhea (5%), rectal pain/discomfort (5%), vomiting (4%)

Neuromuscular & skeletal: Arthritis (5%), myalgia (4%)

Otic: Otitis (4%)

<1%: Abdominal distension, allergic reactions, anaphylaxis, angioedema, bronchitis, bronchospasm, bullous eruption, cholelithiasis (may be caused by weight loss), hepatitis (causal relationship not established), hypoglycemia (in patients with diabetes), pancreatitis, pruritus, rash, transaminases increased, urticaria

Drug Interactions

Amiodarone: Orlistat may decrease the absorption of Amiodarone. *Risk C: Monitor therapy*

Levothyroxine: Orlistat may decrease the serum concentration of Levothyroxine. *Risk C: Monitor therapy*

Warfarin: Orlistat may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Fat-soluble vitamins: Absorption of vitamins A, D, E, and K may be decreased by orlistat. A multivitamin containing the fat-soluble vitamins (A, D, E, and K) should be administered once daily at least 2 hours before or after orlistat.

Nursing: Physical Assessment/MonitoringAssess effectiveness of other medications patient may be taking (especially anticoagulants). Monitor effectiveness of therapy, laboratory results, and adverse reactions at beginning of therapy and periodically during therapy. Assess knowledge/teach patient appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationTake this medication exactly as ordered; do not alter prescribed dose without consulting prescriber. Maintain prescribed diet (ideally, low-fat diet; high-fat meals may result in GI distress), exercise regimen, and vitamin supplements as prescribed. You may experience dizziness or lightheadedness (use caution when driving or engaging in tasks requiring alertness until response to drug is known) or increased flatus and fecal urgency (this may lessen with continued use). Report persistent back, muscle, or joint pain; signs of respiratory tract infection or flu-like symptoms; skin rash or irritation; or other reactions. **Breast-feeding precaution:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Alli™: 60 mg

Xenical®: 120 mg

Generic AvailableNo

ManufacturerRoche Laboratories Inc

Pricing: U.S. (www.drugstore.com)

Capsules (Xenical)

120 mg (90): $258.72

Mechanism of ActionA reversible inhibitor of gastric and pancreatic lipases, thus inhibiting absorption of dietary fats by 30% (at doses of 120 mg 3 times/day).

Pharmacodynamics/Kinetics

Onset of action: 24-48 hours

Duration: 48-72 hours

Absorption: Minimal

Metabolism: Metabolized within the gastrointestinal wall; forms inactive metabolites

Excretion: Feces (97%, 83% as unchanged drug); urine (<2%)

Related Information

- Obesity Treatment Guidelines for Adults

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause anxiety, fatigue, and sleep disorders

Mental Health: Effects on Psychiatric TreatmentNone reported; be vigilant for abuse in patients with anorexia nervosa or bulimia

Cardiovascular ConsiderationsObesity is a modifiable risk factor for cardiovascular disease. When combined with dietary measures, orlistat may decrease weight by 3-4 kg. Orlistat and dietary measures resulted in a greater reduction in the incidence of type 2 diabetes mellitus (noninsulin dependent, NIDDM) over 4 years in obese patients with impaired glucose tolerance (Torgerson, 2004).

Norgesic™ Forte may be confused with Norgesic 40®

Pronunciation(or FEN a dreen, AS pir in, & KAF een)

U.S. Brand NamesNorgesic™ Forte [DSC]; Norgesic™ [DSC]; Orphengesic Forte [DSC]; Orphengesic [DSC]

Canadian Brand NamesNorgesic™; Norgesic™ Forte

Pharmacologic CategorySkeletal Muscle Relaxant

Use: Labeled IndicationsRelief of discomfort associated with skeletal muscular conditions

Dosing: Adults**Muscular pain/spasms:** Oral: 1-2 tablets 3-4 times/day

Dosing: ElderlyNot recommended for use in the elderly; see individual agents

ContraindicationsHypersensitivity to any component of the formulation; glaucoma; pyloric obstruction; duodenal obstruction; achalasia; prostatic hyperplasia; bladder obstruction; myasthenia gravis

Allergy Considerations

- Salicylate Allergy/Sensitivity

Pregnancy Risk FactorD

LactationEnters breast milk/use caution due to aspirin content

Metabolism/Transport Effects

Orphenadrine: **Substrate** (minor) of CYP1A2, 2B6, 2D6, 3A4; **Inhibits** CYP1A2 (weak), 2A6 (weak), 2B6 (weak), 2C9 (weak), 2C19 (weak), 2D6 (weak), 2E1 (weak), 3A4 (weak)

Aspirin: **Substrate** of CYP2C9 (minor)

Caffeine: **Substrate** of CYP1A2 (major), 2C9 (minor), 2D6 (minor), 2E1 (minor), 3A4 (minor); **Inhibits** CYP1A2 (weak), 3A4 (moderate)

Drug Interactions

ACE Inhibitors: Salicylates may diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alendronate: Aspirin may enhance the adverse/toxic effect of Alendronate. Specifically gastrointestinal adverse events. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Anticoagulants: Salicylates may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the anticoagulant effect of Salicylates. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: Salicylates may enhance the adverse/toxic effect of Carbonic Anhydrase Inhibitors. Salicylate toxicity might be enhanced by this same combination. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Corticosteroids (Systemic): Salicylates may enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Drotrecogin Alfa: Salicylates may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Ginkgo Biloba: May enhance the antiplatelet effect of Salicylates. *Risk D: Consider therapy modification*

Heparin: Aspirin may enhance the anticoagulant effect of Heparin. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Ketorolac: May enhance the adverse/toxic effect of Aspirin. *Risk X: Avoid combination*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methotrexate: Salicylates may increase the serum concentration of Methotrexate. Salicylate doses used for prophylaxis of cardiovascular events are not likely to be of concern. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

NSAID (Nonselective): May enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Diclofenac. *Risk D: Consider therapy modification*

Omega-3-Acid Ethyl Esters: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: May decrease the metabolism of Caffeine. **Exceptions:** Gatifloxacin; Gemifloxacin; Levofloxacin; Lomefloxacin; Moxifloxacin; Nalidixic Acid; Ofloxacin; Sparfloxacin; Trovafloxacin. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Regadenoson: Caffeine may diminish the vasodilatory effect of Regadenoson. *Risk D: Consider therapy modification*

Salicylates: May enhance the anticoagulant effect of other Salicylates. *Risk C: Monitor therapy*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Sulfonylureas: Salicylates may enhance the hypoglycemic effect of Sulfonylureas. Of concern with regular, higher doses of salicylates, not sporadic, low doses. *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Thrombolytic Agents: Salicylates may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Tiludronate: Aspirin may decrease the serum concentration of Tiludronate. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk C: Monitor therapy*

Uricosuric Agents: Salicylates may diminish the therapeutic effect of Uricosuric Agents. Specifically, uricosuria. *Risk C: Monitor therapy*

Valproic Acid: Salicylates may increase the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Varicella Virus-Containing Vaccines: Salicylates may enhance the adverse/toxic effect of Varicella Virus-Containing Vaccines. Reye's Syndrome may develop. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Salicylates may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Dental Health Professional ConsiderationsThere is no scientific evidence to warrant discontinuance of aspirin prior to dental surgery. Patients taking one aspirin tablet daily as an antithrombotic and who require dental surgery should be given special consideration in consultation with the physician before removal of the aspirin relative to prevention of postoperative bleeding.

The Food and Drug Administration (FDA), has issued a letter updating information and considerations regarding the use of ibuprofen (400 mg doses) in patients who are taking low dose aspirin (81 mg, immediate release; not enteric coated) for cardioprotection and stroke prevention. Ibuprofen, at these doses, may interfere with aspirin's antiplatelet effect depending upon when it is administered. Patients initiated on aspirin first (for ~1 week) then ibuprofen (400 mg 3 times/day for 10 days) seem to maintain aspirin's platelet effect (Cryer B, 2005). Ibuprofen has the greatest impact on aspirin if administered less than 8 hours before aspirin (Catella-Lawson F, 2001).

Patients may require counseling about the appropriate timing of ibuprofen dosing in relationship to aspirin therapy. With occasional use of ibuprofen, a clinically-significant interaction with aspirin in unlikely. To avoid interference during chronic dosing, a single dose of ibuprofen should be taken 30-120 minutes after aspirin ingestion or at least 8 hours should elapse after ibuprofen dosing before giving aspirin (FDA, 2006; Catella-Lawson F, 2001).

The clinical implications of the interaction are unclear. There have not been any clinical endpoint studies conducted at this time. Avoidance of this interaction is potentially important because aspirin's vascular protection could be decreased or negated.

Other nonselective NSAIDs may have potential for a similar interaction with aspirin. Such has been described with naproxen (Capone ML, 2005). Acetaminophen does not appear to interfere with the antiplatelet effect of aspirin. Other clinical scenarios (use of smaller ibuprofen doses, other aspirin products, other doses of aspirin) have not been evaluated.

Additional information is available at: http://www.fda.gov/cder/drug/infopage/aspirin/default.htm

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: The peripheral anticholinergic effects of orphenadrine may decrease or inhibit salivary flow; normal salivation will return with cessation of drug therapy.

Aspirin: As with all drugs which may affect hemostasis, bleeding is associated with aspirin. Hemorrhage may occur at virtually any site; risk is dependent on multiple variables including dosage, concurrent use of multiple agents which alter hemostasis, and patient susceptibility. Many adverse effects of aspirin are dose related, and are rare at low dosages. Other serious reactions are idiosyncratic, related to allergy or individual sensitivity (see Dental Comment).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness and dizziness are common; may rarely cause hallucinations

Mental Health: Effects on Psychiatric TreatmentMay rarely cause aplastic anemia; use caution with clozapine and carbamazepine; concurrent use with psychotropics may produce additive sedation

Index TermsAspirin, Orphenadrine, and Caffeine; Caffeine, Orphenadrine, and Aspirin

Medication Safety Issues

Sound-alike/look-alike issues:

Norflex™ may be confused with norfloxacin, Noroxin®

International issues:

Flexin® [Israel] may be confused with Floxin® which is a brand name for ofloxacin in the U.S.

Flexin® [Israel]: Brand name for indomethacin in Great Britain

Pronunciation(or FEN a dreen)
U.S. Brand NamesNorflex™
Canadian Brand NamesNorflex™; Orphenace®; Rhoxal-orphendrine
Pharmacologic CategoryAnti-Parkinson's Agent, Anticholinergic; Skeletal Muscle Relaxant
Use: Labeled IndicationsTreatment of muscle spasm associated with acute painful musculoskeletal conditions
Dosing: Adults**Muscle spasms:**

Oral: 100 mg twice daily

I.M., I.V.: 60 mg every 12 hours

Dosing: ElderlyUse caution; generally not recommended for use in the elderly (see Geriatric Considerations).
Administration: OralDo not crush sustained release drug product.
StorageStore at 15°C to 30°C (59°F to 86°F). Protect injection solution from light.
ContraindicationsHypersensitivity to orphenadrine or any component of the formulation; glaucoma; GI obstruction, stenosing peptic ulcer; prostatic hypertrophy, bladder neck obstruction; cardiospasm; myasthenia gravis
Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with HF, cardiac decompensation, coronary insufficiency, tachycardia, or cardiac arrhythmias.

- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for abuse exists.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Sulfites: Injection contains sodium bisulfite which may cause allergic reaction in some individuals.

Other warnings/precautions:

- Long-term use: Has not been evaluated for continuous long-term use; monitor closely.

Geriatric ConsiderationsBecause of its anticholinergic side effects (eg, constipation, urinary retention, confusion), orphenadrine is not a drug of choice in the elderly.
Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. There are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if clearly needed.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Cardiovascular: Palpitation, tachycardia

Central nervous system: Agitation, drowsiness, dizziness, euphoria, hallucination, headache, mental confusion

Dermatologic: Pruritus, urticaria

Gastrointestinal: Constipation, gastric irritation, nausea, vomiting, xerostomia

Genitourinary: Urination hesitancy, urinary retention

Hematologic: Aplastic anemia (rare)

Neuromuscular & skeletal: Tremor, weakness

Ocular: Blurred vision, intraocular pressure increased, nystagmus, pupil dilation

Respiratory: Nasal congestion

Miscellaneous: Anaphylactic reaction (injection, rare), hypersensitivity

Metabolism/Transport Effects**Substrate** (minor) of CYP1A2, 2B6, 2D6, 3A4; **Inhibits** CYP1A2 (weak), 2A6 (weak), 2B6 (weak), 2C9 (weak), 2C19 (weak), 2D6 (weak), 2E1 (weak), 3A4 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Nursing: Physical Assessment/MonitoringMonitor effectiveness of therapy (according to rationale for therapy) and adverse reactions at beginning of therapy and periodically with long-term use. Do not discontinue abruptly; taper dosage slowly. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake exactly as directed. Do not increase dose or discontinue without consulting prescriber. Do not chew or crush sustained release tablets. Do not use alcohol, prescriptive or OTC antidepressants, sedatives, or pain medications without consulting prescriber. You may experience drowsiness, dizziness, lightheadedness (avoid driving or engaging in tasks requiring alertness until response to drug is known); nausea or vomiting (small frequent meals, frequent mouth care, or sucking hard candy may help); constipation (increased exercise, fluids, fruit, or fibers may help); or decreased urination (void before taking medication). Report excessive drowsiness or mental agitation, chest pain, skin rash, swelling of mouth/face, difficulty speaking, or vision changes. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as citrate: 30 mg/mL (2 mL)

Norflex™: 30 mg/mL (2 mL) [contains sodium bisulfite]

Tablet, extended release, as citrate: 100 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablet, 12-hour (Orphenadrine Citrate CR)

100 mg (30): $49.00

Mechanism of ActionIndirect skeletal muscle relaxant thought to work by central atropine-like effects; has some euphorigenic and analgesic properties

Pharmacodynamics/Kinetics

Onset of effect: Peak effect: Oral: 2-4 hours

Duration: 4-6 hours

Protein binding: 20%

Metabolism: Extensively hepatic

Half-life elimination: 14-16 hours

Excretion: Primarily urine (8% as unchanged drug)

Dental Health: Effects on Dental Treatment The peripheral anticholinergic effects of orphenadrine may decrease or inhibit salivary flow; normal salivation will return with cessation of drug therapy.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status Drowsiness and dizziness are common; may rarely cause hallucinations

Mental Health: Effects on Psychiatric Treatment May rarely cause aplastic anemia; use caution with clozapine and carbamazepine; has been used to treat tardive dyskinesia and augment typical antipsychotics; clozapine is a better option; concurrent use with psychotropics may produce additive sedation

Index Terms Orphenadrine Citrate

CDC Interim Recommendations Concerning Use of Antivirals During 2008-09 Influenza Season - December 2008

The Centers for Disease Control (CDC) has issued a Health Advisory with interim recommendations for chemoprophylaxis or influenza treatment with the following antiviral agents: Oseltamivir (Tamiflu®), zanamivir (Relenza®), rimantadine (Flumadine®), amantadine (Symmetrel®).

The recommendations were prompted by preliminary data in a limited number of states indicating a high prevalence of the oseltamivir-resistant influenza A (H1N1) strain. Influenza activity remains low at the present time, but of the 50 H1N1 isolates from 12 states tested between October 1 and December 19, 2008, 49 (98%) were resistant to oseltamivir. The CDC is unable to make any accurate predictions of which influenza virus types (A or B) or subtypes of influenza A (H1N1 or H3N2) will predominate during the 2008-09 season, but based on the current findings, the following recommendations have been made:

- Patients testing positive for influenza type B: If treatment is indicated, patients may receive either oseltamivir or zanamivir (no preference).

- Patients testing positive for influenza type A (or patients testing negative for influenza, but likelihood of influenza infection is high): If treatment is indicated, patient may receive zanamivir. If zanamivir therapy is inappropriate (eg, patients with chronic respiratory disease, patients <7 years of age) or zanamivir is unavailable, combination treatment with oseltamivir and rimantadine is acceptable (if rimantadine is unavailable, amantadine may be substituted). Oseltamivir monotherapy should only be used if local surveillance indicates that influenza A (H3N2) or influenza type B viruses are likely.

- If confirmatory diagnostic testing to distinguish between subtypes of influenza A (H1N1 or H3N2) is available, and treatment is indicated:

    Patients testing positive for influenza A (H3N2): Use oseltamivir or zanamivir (no preference)

    Patients testing positive for influenza A (H1N1): Use zanamivir (or combination treatment with oseltamivir and rimantadine as an alternative)

Patients requiring chemoprophylaxis due to potential exposure with laboratory-confirmed influenza A (H3N2) or influenza B should receive oseltamivir or zanamivir. Patients requiring chemoprophylaxis due to influenza A (H1N1) virus should receive zanamivir (or rimantadine, if zanamivir use contraindicated).

The CDC is reminding clinicians to continue to vaccinate patients using the influenza vaccine, which is expected to be effective against all circulating influenza vaccines, including the oseltamivir-resistant strain.

For additional information, including the CDC Health Advisory, please refer to http://www2a.cdc.gov/HAN/ArchiveSys/ViewMsgV.asp?AlertNum=00279

Neuropsychiatric Events Associated With Tamiflu® (Oseltamivir) - March 4, 2008

Roche Laboratories, in conjunction with the U.S. Food and Drug Administration (FDA), has issued a Dear Healthcare Professional letter concerning postmarketing reports of neuropsychiatric events in patients receiving Tamiflu® (oseltamivir). These events include hallucination, delirium, and abnormal behavior, which in some cases have led to injury (with fatalities). Although the role of oseltamivir in the development of these events has not been established, the prescribing information has been revised to acknowledge their occurrence. The reported events primarily occurred in pediatric patients from Japan and often had a sudden onset with rapid resolution.

Patients with influenza (particularly pediatric patients) may be more susceptible to the development of adverse events (seizures, confusion, abnormal behavior) early in the course of their illness regardless of whether oseltamivir therapy has been initiated. Additionally, adverse events may occur in the presence of encephalitis or encephalopathy, or in the absence of marked disease. Patients receiving oseltamivir should be closely monitored for any unusual behavior and healthcare professionals should be notified immediately if such signs occur.

Additional information can be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Tamiflu.

Medication Safety Issues

Sound-alike/look-alike issues:

Tamiflu® may be confused with Thera-Flu®

Pronunciation(oh sel TAM i vir)

U.S. Brand NamesTamiflu®

Canadian Brand NamesTamiflu®

Pharmacologic CategoryAntiviral Agent; Neuraminidase Inhibitor

Use: Labeled IndicationsTreatment of uncomplicated acute illness due to influenza (A or B) infection in children ≥1 year of age and adults who have been symptomatic for no more than 2 days; prophylaxis against influenza (A or B) infection in children ≥1 year of age and adults

The Advisory Committee on Immunization Practices (ACIP) recommends that **treatment** be considered for the following:

- Persons hospitalized with laboratory confirmed influenza (may also have benefit if started >48 hours after onset of illness).
- Persons with laboratory confirmed influenza pneumonia.
- Persons with laboratory confirmed influenza and bacterial infections.
- Persons with laboratory confirmed influenza and who are at higher risk for influenza complications.
- Persons presenting for care within 48 hours of laboratory confirmed influenza onset and who want to decrease duration and/or severity of their symptoms or decrease the risk of transmission to those at high risk for complications.

The ACIP recommends that **prophylaxis** be considered for the following:

- Persons at high risk for influenza infection during the first 2 weeks following vaccination (eg, children <9 years and not previously vaccinated) if the virus is circulating in the community.
- Persons at high risk for influenza infection, but the vaccination is contraindicated.
- Unvaccinated family members or healthcare providers with prolonged exposure to or close contact with high-risk persons, unvaccinated persons, or infants <6 months of age.
- Persons at high risk for influenza infection, their family members and close contacts, and healthcare workers when the circulating strain of influenza is not matched with the vaccine.
- Persons with immune deficiency or those who may not respond to vaccination.
- Unvaccinated staff and persons during response to an outbreak in a closed institutional setting that has patients at high risk for infection (eg, extended care facilities).

Dosing: Adults

Influenza prophylaxis: Oral: 75 mg once daily; initiate treatment within 2 days of contact with an infected individual; duration of treatment: 10 days. During community outbreaks, dosing is 75 mg once daily. May be used for up to 6 weeks; duration of protection lasts for length of dosing period.

Influenza treatment: Oral: 75 mg twice daily initiated within 2 days of onset of symptoms; duration of treatment: 5 days

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Influenza prophylaxis: Oral: Initiate treatment within 2 days of contact with an infected individual; duration of treatment: 10 days:

Children: 1-12 years:

≤15 kg: 30 mg once daily

>15 kg to ≤23 kg: 45 mg once daily

>23 kg to ≤40 kg: 60 mg once daily

>40 kg: 75 mg once daily

Influenza treatment: Oral: Initiate treatment within 2 days of onset of symptoms; duration of treatment: 5 days:

Children: 1-12 years:

≤15 kg: 30 mg twice daily

>15 kg - ≤23 kg: 45 mg twice daily

>23 kg - ≤40 kg: 60 mg twice daily

>40 kg: 75 mg twice daily

Adolescents ≥13 years: Refer to adult dosing.

Dosing: Renal ImpairmentAdults:

Cl_{cr} 10-30 mL/minute:

Treatment: Reduce dose to 75 mg once daily for 5 days.

Prophylaxis: Administer 75 mg every other day or 30 mg once daily.

CAPD (unlabeled dose): 30 mg once weekly (Robson, 2006)

Hemodialysis (unlabeled dose): 30 mg after every other session (Robson, 2006)

Dosing: Hepatic ImpairmentNo adjustment required in mild-to-moderate hepatic impairment. Safety and kinetics in patients with severe hepatic impairment have not been evaluated.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralCapsules may be opened and mixed with sweetened liquid (eg, chocolate syrup).

Dietary ConsiderationsTake with or without food; take with food to improve tolerance.

Storage

Capsules: Store at 25°C (77°F).

Oral suspension: Store powder for suspension at 25°C (77°F). Once reconstituted, store suspension under refrigeration at 2°C to 8°C (36°F to 46°F); do not freeze. Use within 10 days of preparation.

ReconstitutionOral suspension: Reconstitute with 23 mL of water (to make 25 mL total suspension).

Extemporaneously Prepared

If the commercially prepared oral suspension is not available, the manufacturer provides the following compounding information to prepare a **15 mg/mL** suspension in emergency situations. **Note:** The strength and dosing instructions differ from that of the commercially prepared product (see chart below).

1. Calculate the total volume needed by patient weight (refer to chart below).
2. Calculate the number of capsules and required volume of vehicle (refer to chart below). **Note:** Acceptable vehicles are cherry syrup or Ora-Sweet® SF.
3. Transfer contents of capsules into mortar and triturate granules into a fine powder.
4. Add ~$^{1}/_{3}$ of vehicle and triturate into a uniform suspension.
5. Add another $^{1}/_{3}$ of vehicle and triturate, transfer to amber prescription bottle.
6. Add remaining vehicle to prescription bottle; shake well.

Suspension is stable for 35 days under refrigeration at 2°C to 8°C (36°F to 46°F) or 5 days at room temperature of 25°C (77°F). Shake gently prior to use. Do **not** dispense with dosing device provided with commercially-available product.

Preparation of Oseltamivir 15 mg/mL Suspension

Body Weight	**Total Volume per Patient**[1]	**# of 75 mg Capsules**[2]	**Required Volume of Vehicle**[2,3]	**Treatment Dose (wt based)**[4]	**Prophylactic Dose (wt based)**[4]
≤15 kg	30 mL	6	29 mL	2 mL (30 mg) twice daily for 5 days	2 mL (30 mg) once daily for 10 days
16-23 kg	40 mL	8	38.5 mL	3 mL (45 mg) twice daily for 5 days	3 mL (45 mg) once daily for 10 days
24-40 kg	50 mL	10	48 mL	4 mL (60 mg) twice daily for 5 days	4 mL (60 mg) once daily for 10 days
≥41 kg	60 mL	12	57 mL	5 mL (75 mg) twice daily for 5 days	5 mL (75 mg) once daily for 10 days

[1] Entire course of therapy.

[2] Based on total volume per patient.

[3] Acceptable vehicles are cherry syrup or Ora-Sweet® SF.

[4] Using 15 mg/mL suspension.

ContraindicationsHypersensitivity to oseltamivir or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity: Rare but severe hypersensitivity reactions (anaphylaxis, severe dermatologic reactions) have been associated with use.
- Neuropsychiatric events: Rare occurrences of neuropsychiatric events (including confusion, delirium, hallucinations, and/or self-injury) have been reported from postmarketing surveillance; direct causation is difficult to establish (influenza infection may also be associated with behavioral and neurologic changes).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with chronic cardiac disease; efficacy has not been established.
- Hepatic impairment: Use with caution in patients with severe hepatic impairment; safety and efficacy have not been established.
- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment is required for creatinine clearance <30 mL/minute.
- Respiratory disease: Use with caution in patients with respiratory disease; efficacy has not been established.

Special populations:

- Immunocompromised patients: Use with caution in immunocompromised patients; safety and efficacy for treatment or prophylaxis in immunocompromised patients have not been established.
- Pediatrics: Rare occurrences of neuropsychiatric events (including confusion, delirium, hallucinations, and/or self-injury) have been reported primarily in pediatric patients from postmarketing surveillance; monitor closely for signs of any unusual behavior. Safety and efficacy have not been established in children <1 year of age.

Other warnings/precautions:

- Appropriate use: Oseltamivir is not a substitute for the influenza virus vaccine. Also consider primary or concomitant bacterial infections. Efficacy has not been established if treatment begins >40 hours after the onset of symptoms.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are insufficient human data to determine the risk to a pregnant woman or developing fetus. Studies evaluating the effects on embryo-fetal development in rats and rabbits showed a dose-dependent increase in the rates of minor skeleton abnormalities in exposed offspring. The rate of each abnormality remained within the background rate of occurrence in the species studied.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsOseltamavir and its carboxylate metabolite have been detected in breast milk. Breast milk samples were obtained from a single patient (~9 months post-partum) over the course of 5 days of treatment. The maximum total concentration of oseltamavir (expressed as parent drug and metabolite) was 81.6 ng/mL. Using a milk concentration of 81.6 ng/mL, the estimated exposure to the breastfeeding infant would be ~0.5% of the weight adjusted maternal dose (in a 60 kg woman).

Adverse Reactions

>10%: Gastrointestinal: Vomiting (2% to 15%)

1% to 10%: Gastrointestinal: Nausea (3% to 10%), abdominal pain (2% to 5%)

<1%: Anemia, angina, fracture, peritonsillar abscess, pneumonia, pseudomembranous colitis, pyrexia

Postmarketing and/or case reports: Allergy, anaphylactic/anaphylactoid reaction, arrhythmia, confusion, dermatitis, diabetes aggravation, eczema, erythema multiforme, hepatitis, liver function tests abnormal, neuropsychiatric events (self-injury, confusion, delirium), rash, seizure, Stevens-Johnson syndrome, swelling of face or tongue, toxic epidermal necrolysis, urticaria

Drug Interactions

Influenza Virus Vaccine: Antiviral Agents (Influenza A and B) may diminish the therapeutic effect of Influenza Virus Vaccine. This only pertains to live, attentuated influenza virus vaccine. *Risk D: Consider therapy modification*

Monitoring ParametersSigns or symptoms of unusual behavior, including attempts at self-injury, confusion, and/or delirium

Nursing: Physical Assessment/MonitoringTeach patient appropriate use, interventions to reduce side effects, and adverse reactions to report.

Patient EducationThis is not a substitute for the flu shot. Must be taken within 2 days of contact with an infected individual or onset of flu symptoms (eg, fever, cough, headache, fatigue, muscular weakness, and sore throat). Take as directed; do not increase dose or frequency, and do not miss a dose. You may experience nausea or vomiting (small frequent meals, good mouth care, chewing gum, or sucking hard candy may help). Report hallucinations or unusual behavior or significant adverse effects to your prescriber. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as phosphate:

Tamiflu®: 30 mg, 45 mg, 75 mg

Powder for oral suspension:

Tamiflu®: 12 mg/mL (25 mL) [contains sodium benzoate; tutti-frutti flavor]

Generic AvailableNo

ManufacturerRoche Laboratories Inc

Pricing: U.S. (www.drugstore.com)

Capsules (Tamiflu)

30 mg (10): $92.99

45 mg (10): $92.99

75 mg (10): $92.99

Suspension (reconstituted) (Tamiflu)

12 mg/mL (25): $50.99

Mechanism of ActionOseltamivir, a prodrug, is hydrolyzed to the active form, oseltamivir carboxylate (OC). OC inhibits influenza virus neuraminidase, an enzyme known to cleave the budding viral progeny from its cellular envelope attachment point (neuraminic acid) just prior to release.

Pharmacodynamics/Kinetics

Absorption: Well absorbed

Distribution: V_d: 23-26 L (oseltamivir carboxylate)

Protein binding, plasma: Oseltamivir carboxylate: 3%; Oseltamivir: 42%

Metabolism: Hepatic (90%) to oseltamivir carboxylate; neither the parent drug nor active metabolite has any effect on the cytochrome P450 system

Bioavailability: 75% as oseltamivir carboxylate

Half-life elimination: Oseltamivir: 1-3 hours; Oseltamivir carboxylate: 6-10 hours

Excretion: Urine (>90% as oseltamivir carboxylate); feces

Related Information

- USPHS / IDSA Guidelines for the Prevention of Opportunistic Infections in Persons Infected With HIV

Pharmacotherapy PearlsIn clinical studies of the influenza virus, 1.3% of post-treatment isolates in adults and adolescents and 8.6% of isolates in children had decreased neuraminidase susceptibility *in vitro* to oseltamivir carboxylate.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause insomnia

Mental Health: Effects on Psychiatric TreatmentNone reported

Pronunciation(oks a SIL in)

Pharmacologic Category[Antibiotic, Penicillin]

Use: Labeled IndicationsTreatment of infections such as osteomyelitis, septicemia, endocarditis, and CNS infections caused by susceptible strains of *Staphylococcus*

Dosing: Adults

Endocarditis: I.V.: 2 g every 4 hours with gentamicin

Mild-to-moderate infections: I.M., I.V.: 250-500 mg every 4-6 hours

Prosthetic joint infection: I.V.: 2 g every 4 hours with rifampin

Severe infections: I.M., I.V.: 1-2 g every 4-6 hours

Staphylococcus aureus,**methicillin-susceptible infections, including brain abscess, bursitis, erysipelas, mastitis, mastoiditis, osteomyelitis, perinephric abscess, pneumonia, pyomyositis, scalded skin syndrome, toxic shock syndrome:** I.V.: 2 g every 4 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Arthritis (septic): I.V.: 37 mg/kg every 6 hours

Epiglottitis: I.V.: 150-200 mg/kg/day divided every 6 hours

Mild-to-moderate infections: I.M., I.V.: 100-150 mg/kg/day in divided doses every 6 hours (maximum: 4 g/day)

Severe infections: I.M., I.V.: 150-200 mg/kg/day in divided doses every 6 hours (maximum: 12 g/day)

Staphylococcal scalded-skin syndrome: I.V.: 150 mg/kg/day divided every 6 hours for 5-7 days

Dosing: Renal Impairment

Cl_{cr} <10 mL/minute: Clinical practice varies; some clinicians recommend adjustment to the lower range of the usual dosage as based on severity of infection.

Not dialyzable (0% to 5%)

Administration: I.V.Administer around-the-clock to promote less variation in peak and trough serum levels. Administer IVP over 10 minutes. Administer IVPB over 30 minutes.

Administration: I.V. DetailRapid administration may result in seizures.

Dietary ConsiderationsSodium content of 1 g: 92.4 mg (4.02 mEq)

StorageReconstituted parenteral solution is stable for 3 days at room temperature and 7 days when refrigerated. For I.V. infusion in NS or D_5W, solution is stable for 6 hours at room temperature.

CompatibilityStable in dextran 70 6% in dextrose, dextran 40 10% in dextrose, D_5LR, $D_{10}W$, hetastarch 6%, LR; **variable stability (consult detailed reference)** in D_5NS, D_5W, NS.

Y-site administration: Compatible: Acyclovir, cyclophosphamide, diltiazem, famotidine, fluconazole, foscarnet, heparin, hydrocortisone sodium succinate, hydromorphone, labetalol, levofloxacin, magnesium sulfate, meperidine, methotrexate, morphine, perphenazine, potassium chloride, tacrolimus, vitamin B complex with C, zidovudine. **Incompatible:** Sodium bicarbonate, verapamil.

Compatibility when admixed: Compatible: Chloramphenicol, dopamine, potassium chloride, sodium bicarbonate. **Incompatible:** Cytarabine. **Variable (consult detailed reference):** Amikacin, verapamil.

ContraindicationsHypersensitivity to oxacillin or other penicillins or any component of the formulation

Allergy Considerations

- Penicillin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Serious and occasionally severe or fatal hypersensitivity (anaphylactoid) reactions have been reported in patients on penicillin therapy, especially with a history of beta-lactam hypersensitivity, history of sensitivity to multiple allergens, or previous IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria). Use with caution in asthmatic patients.
- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and

pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment recommended.

Special populations:

- Elderly: Use with caution in the elderly; dosage adjustment recommended.
- Neonates: Use with caution in neonates; elimination of drug is slow.

Geriatric ConsiderationsOxacillin has not been studied in the elderly. Dosing adjustments are not necessary except in renal failure (eg, Cl_{cr} <10 mL/minute). Consider sodium content in patients who may be sensitive to volume expansion (ie, CHF).

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events have not been observed in animal studies; therefore, oxacillin is classified as pregnancy category B. Oxacillin is distributed into the amniotic fluid and is detected in cord blood. There was not an increased risk of teratogenic effects with oxacillin observed in an epidemiologic study.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsLow levels of oxacillin are found in breast milk. The manufacturer recommends that caution be exercised when administering oxacillin to nursing women. Other penicillins distribute into human milk and are considered safe for use during breast-feeding. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Oxacillin in Pregnancy & Lactation

Adverse ReactionsFrequency not defined.

Central nervous system: Fever

Dermatologic: Rash

Gastrointestinal: Diarrhea, nausea, vomiting

Hematologic: Agranulocytosis, eosinophilia, leukopenia, neutropenia, thrombocytopenia

Hepatic: AST increased, hepatotoxicity

Renal: Acute interstitial nephritis, hematuria

Miscellaneous: Serum sickness-like reactions

Drug Interactions

Fusidic Acid: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Methotrexate: Penicillins may decrease the excretion of Methotrexate. *Risk C: Monitor therapy*

Tetracycline Derivatives: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Penicillins. *Risk C: Monitor therapy*

Test InteractionsMay interfere with urinary glucose tests using cupric sulfate (Benedict's solution, Clinitest®); may inactivate aminoglycosides *in vitro*; false-positive urinary and serum proteins

Monitoring ParametersObserve for signs and symptoms of anaphylaxis during first dose; monitor periodic CBC, urinalysis, BUN, serum creatinine, AST and ALT

Nursing: Physical Assessment/MonitoringAssess results of culture and sensitivity tests and patient's allergy history prior to beginning therapy. See Administration for I.V. specifics (rapid administration may result in seizures). Patient should be monitored closely with first infusion/injection (anaphylactic reaction). Evaluate results of laboratory tests, therapeutic effectiveness (resolution of infection; if no response, therapy should be reevaluated), and adverse reactions (hypersensitivity, opportunistic infection, hepatotoxicity, renal toxicity, gastrointestinal upset) at regular intervals during treatment. Caution patients with diabetes about using Clinitest® (may interfere with accuracy). Teach patient possible side effects/appropriate interventions and symptoms to report.

Monitoring: Lab TestsPerform culture and sensitivity studies prior to initiating therapy; monitor periodic CBC, urinalysis, BUN, serum creatinine, AST and ALT

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication can only be administered by infusion or injection. Report immediately any redness, swelling, burning, or pain at injection/infusion site; respiratory difficulty or swallowing; chest pain; or rash. May cause nausea (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report signs of opportunistic infection (eg, fever, chills, sore throat, burning urination, fatigue); changes in urinary elimination; yellowing of skin or sclera, dark urine, or pale stool; persistent diarrhea; rash or other persistent side effects; or if condition does not respond to treatment.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Infusion [premixed iso-osmotic dextrose solution]: 1 g (50 mL); 2 g (50 mL)

Injection, powder for reconstitution: 1 g, 2 g, 10 g

Generic AvailableYes

Mechanism of ActionInhibits bacterial cell wall synthesis by binding to one or more of the penicillin-binding proteins (PBPs); which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.

Pharmacodynamics/Kinetics

Distribution: Into bile, synovial and pleural fluids, bronchial secretions; also distributes to peritoneal and pericardial fluids; penetrates the blood-brain barrier only when meninges are inflamed

Protein binding: ~94%

Metabolism: Hepatic to active metabolites

Half-life elimination: Children 1 week to 2 years: 0.9-1.8 hours; Adults: 23-60 minutes; prolonged in neonates and with renal impairment

Time to peak, serum: I.M.: 30-60 minutes

Excretion: Urine and feces (small amounts as unchanged drug and metabolites)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Oxaliplatin may be confused with Aloxi®, carboplatin

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(ox AL i pla tin)

U.S. Brand NamesEloxatin®

Canadian Brand NamesEloxatin®

Pharmacologic CategoryAntineoplastic Agent, Alkylating Agent; Antineoplastic Agent, Platinum Analog

Use: Labeled IndicationsTreatment of stage III colon cancer and advanced colorectal cancer

Use: Unlabeled/InvestigationalTreatment of esophageal cancer, gastric cancer, head and neck cancer, non-Hodgkin's lymphoma, ovarian cancer, pancreatic cancer

Dosing: AdultsDetails concerning dosing in combination regimens should also be consulted.

Stage III colon cancer and colorectal cancer: I.V.:

85 mg/m^2 every 2 weeks **or**

Unlabeled doses:

20-25 mg/m^2 days 1-5 every 3 weeks **or**

100-130 mg/m^2 every 2-3 weeks

Dosing: ElderlyNo dosing adjustment recommended.

Dosing: Renal ImpairmentThe FDA-approved labeling does not contain renal dosing adjustment guidelines. Oxaliplatin is primarily eliminated renally; in patients with Cl_{cr} <30 mL/minute, the AUC is increased ~190%. Oxaliplatin use has been studied in 25 patients with renal dysfunction; treatment was well-tolerated in patients with mild-to-moderate impairment (Cl_{cr} 20-59 mL/minute), suggesting that dose reduction is not necessary in this patient population (Takimoto, 2003). Patients with severe renal impairment (Cl_{cr} <20 mL/minute) have not been adequately studied; consider omitting dose or changing chemotherapy regimen if Cl_{cr} <20 mL/minute.

Note: Canadian labeling: Use in patients with Cl_{cr} <30 mL/minute is contraindicated in Canadian labeling.

Dosing: Hepatic ImpairmentMild, moderate, or severe hepatic impairment: Dosage adjustment not necessary (Synold, 2007; Doroshow, 2003).

Dosing: Adjustment for Toxicity Acute toxicities: Longer infusion times may mitigate acute toxicities.

Neurosensory events:

Persistent (>7 days) grade 2 neurosensory events: Consider oxaliplatin dose reduction if symptoms do not resolve:

Stage III colon cancer: Reduce dose to 75 mg/m^2

Advanced colorectal cancer: Reduce dose to 65 mg/m^2

Consider withholding oxaliplatin for grade 2 neuropathy lasting >7 days despite dose reduction.

Persistent grade 3 neurosensory events: Consider discontinuing oxaliplatin

Other toxicities (grade 3/4 gastrointestinal toxicity, grade 4 neutropenia, or grade 3/4 thrombocytopenia): After recovery from toxicity, oxaliplatin dose reductions are recommended:

Stage III colon cancer: Reduce dose to 75 mg/m^2 ; delay next dose until neutrophils recover to ≥1500/mm^3 and platelets recover to ≥75,000/mm^3

Advanced colorectal cancer: Reduce dose to 65 mg/m^2; delay next dose until neutrophils recover to ≥1500/mm^3 and platelets recover to ≥75,000/mm^3

Dosing: Combination Regimens

Biliary adenocarcinoma: GEMOX

Colorectal cancer:

- Bevacizumab-Oxaliplatin-Fluorouracil-Leucovorin
- Cetuximab-FOLFOX4
- FLOX (Nordic FLOX)
- FOIL
- FOLFOX 1
- FOLFOX 2
- FOLFOX 3
- FOLFOX 4
- FOLFOX 6
- FOLFOX 7
- XelOx (Colorectal Cancer)

Esophageal cancer:

- Epirubicin-Oxaliplatin-Capecitabine
- Epirubicin-Oxaliplatin-Fluorouracil (Esophageal Cancer) Cancer)

Gastric cancer: Epirubicin-Oxaliplatin-Capecitabine

Lymphoma, non-Hodgkin's: DHAP

Lymphoma, non-Hodgkin's: DHAP

Pancreatic cancer: Gemcitabine-Oxaliplatin

Calculations

- Body Surface Area: Adults
- Creatinine Clearance: Adults

Administration: I.V.Administer as I.V. infusion over 2-6 hours. Flush infusion line with D_5W prior to administration of any concomitant medication. Patients should receive an antiemetic premedication regimen. Avoid mucositis prophylaxis with ice chips during oxaliplatin infusion.

StorageStore intact vials at room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F); do not freeze. Protect concentrated solution from light (store in original outer carton). According to the manufacturer, solutions diluted for infusion are stable up to 6 hours at room temperature of 20°C to 25°C (68°F to 77°F) or up to 24 hours under refrigeration at 2°C to 8°C (36°F to 46°F). Oxaliplatin solution diluted with D_5W to a final concentration of 0.7 mg/mL (polyolefin container) has been shown to retain >90% of it's original concentration for up to 30 days when stored at room temperature or refrigerated; artificial light did not affect the concentration (Andre, 2007). As this study did not examine sterility, refrigeration would be preferred to limit microbial growth.

Reconstitution

Aqueous solution: **Do not prepare using a chloride-containing solution (eg, NaCl).** Dilution with D_5W (250 or 500 mL) is required prior to administration. Infusion solutions do not require protection from light. Use appropriate precautions for handling and disposal.

Lyophilized powder [CAN; not available in U.S.]: **Do not prepare using a chloride-containing solution (eg, NaCl).** Use only water for injection or D_5W to reconstitute powder. To obtain final concentration of 5 mg/mL add 10 mL of diluent to 50 mg vial or 20 mL diluent to 100 mg vial. Gently swirl vial to dissolve powder. Dilution with D_5W (250 or 500 mL) is required prior to administration. Infusion solutions do not require protection from light. Discard unused portion of vial. Use appropriate precautions for handling and disposal.

Compatibility**Incompatible** with alkaline solutions (eg, fluorouracil) and chloride-containing solutions. Flush infusion line with D_5W prior to, and following, administration of concomitant medications via same I.V. line.

Y-site administration: Compatible: Allopurinol, aminophylline, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, chlorpromazine, cimetidine, cyclophosphamide, dexamethasone, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin, droperidol, enalaprilat, epirubicin, etoposide phosphate, famotidine, fentanyl, furosemide, gemcitabine, granisetron, haloperidol lactate, heparin, hydrocortisone sodium succinate, hydromorphone, hydroxyzine, ifosfamide, irinotecan, leucovorin calcium, lorazepam, magnesium sulfate, mannitol, meperidine, mesna, methotrexate, methylprednisolone sodium succinate, metoclopramide, mitoxantrone, morphine, nalbuphine, ondansetron, paclitaxel, palonosetron, potassium chloride, prochlorperazine, promethazine, ranitidine, sodium bicarbonate, theophylline, topotecan, verapamil, vincristine, vinorelbine. **Incompatible:** Diazepam.

ContraindicationsHypersensitivity to oxaliplatin, other platinum-containing compounds, or any component of the formulation

Canadian labeling: Additional contraindications (not in U.S. labeling): Pregnancy, breast-feeding; severe renal impairment (Cl_{cr} <30 mL/minute)

Allergy Considerations

- [Platinum Derivative Allergy]

Warnings/Precautions

Boxed warnings:

- Anaphylaxis: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Anaphylaxis: **[U.S. Boxed Warning]: Anaphylactic/anaphylactoid reactions may occur within minutes of oxaliplatin administration; symptoms may be managed with epinephrine, corticosteroids, and antihistamines.** Allergic reactions may occur with any cycle and may include bronchospasm (rare), erythema, hypotension (rare), pruritus, rash, and/or urticaria.

- Neuropathy: Two different types of peripheral sensory neuropathy may occur: First, an acute (within first 2 days), reversible (resolves within 14 days), with primarily peripheral symptoms that are often exacerbated by cold (may include pharyngolaryngeal dysesthesia); avoid mucositis prophylaxis with ice chips during oxaliplatin infusion; may recur with subsequent doses. Secondly, a more persistent (>14 days) presentation that often interferes with daily activities (eg, writing, buttoning, swallowing), these symptoms may improve upon discontinuing treatment.

- Hepatotoxicity: Hepatotoxicity (including hepatic failure and hepatitis) has been reported. The presence of hepatic vascular disorders (including veno-occlusive disease) should be considered, especially in individuals developing portal hypertension or who present with increased liver function tests.

- Pulmonary fibrosis: May cause pulmonary fibrosis; withhold treatment for unexplained pulmonary symptoms (eg, crackles, dyspnea, nonproductive cough, pulmonary infiltrates) until interstitial lung disease or pulmonary fibrosis are excluded.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; increased toxicity may occur.

Concurrent drug therapy issues:

- Fluorouracil (5-FU): Risk of adverse hematologic effects or adverse GI effects associated with severe diarrhea/emesis (eg, dehydration, hypokalemia, ileus) may be increased with concomitant use of 5-FU.

- Taxane derivatives: When administered as sequential infusions, taxane derivatives (docetaxel, paclitaxel) should be administered before platinum derivatives (carboplatin, cisplatin, oxaliplatin) to limit myelosuppression and enhance efficacy.

Special populations:

- Elderly: Elderly patients are more sensitive to adverse events, particularly diarrhea, dehydration, hypokalemia, leukopenia, fatigue, and syncope.

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorD

Pregnancy ConsiderationsDecreased fetal weight, decreased ossification, and increased fetal deaths were observed in animal studies at one-tenth the equivalent human dose. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should be advised to avoid pregnancy and use effective contraception during treatment.

Canadian labeling: Use in pregnant women is contraindicated in the Canadian labeling. Males should be advised not to father children during and for up to 6 months following therapy. May cause permanent infertility in males. Prior to initiating therapy, advise males desiring to father children, to seek counseling on sperm storage.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.

Adverse ReactionsPercentages reported with monotherapy.

>10%:

Central nervous system: Fatigue (61%), fever (25%), pain (14%), headache (13%), insomnia (11%)

Gastrointestinal: Nausea (64%), diarrhea (46%), vomiting (37%), abdominal pain (31%), constipation (31%), anorexia (20%), stomatitis (14%)

Hematologic: Anemia (64%; grades 3/4: 1%), thrombocytopenia (30%; grades 3/4: 3%), leukopenia (13%)

Hepatic: AST increased (54%; grades 3/4: 4%), ALT increased (36%; grades 3/4: 1%), total bilirubin increased (13%; grades 3/4: 5%)

Neuromuscular & skeletal: Peripheral neuropathy (may be dose limiting; 76%; acute 65%; grades 3/4: 5%; persistent 43%; grades 3/4: 3%), back pain (11%)

Respiratory: Dyspnea (13%), cough (11%)

1% to 10%:

Cardiovascular: Edema (10%), chest pain (5%), peripheral edema (5%), flushing (3%), thromboembolism (2%)

Central nervous system: Dizziness (7%)

Dermatologic: Rash (5%), alopecia (3%), hand-foot syndrome (1%)

Endocrine & metabolic: Dehydration (5%), hypokalemia (3%)

Gastrointestinal: Dyspepsia (7%), taste perversion (5%), flatulence (3%), mucositis (2%), gastroesophageal reflux (1%), dysphagia (acute 1% to 2%)

Genitourinary: Dysuria (1%)

Hematologic: Neutropenia (7%)

Local: Injection site reaction (9%; redness/swelling/pain)

Neuromuscular & skeletal: Rigors (9%), arthralgia (7%)

Ocular: Abnormal lacrimation (1%)

Renal: Serum creatinine increased (5% to 10%)

Respiratory: URI (7%), rhinitis (6%), epistaxis (2%), pharyngitis (2%), pharyngolaryngeal dysesthesia (grades 3/4: 1% to 2%)

Miscellaneous: Allergic reactions (3%); hypersensitivity (includes urticaria, pruritus, facial flushing, shortness of breath, bronchospasm, diaphoresis, hypotension, syncope: grades 3/4: 2% to 3%); hiccup (2%)

<1%, postmarketing, and/or case reports (reported with mono- and combination therapy): Acute renal failure, alkaline phosphatase increased, anaphylactic/anaphylactoid reactions, anaphylactic shock, angioedema, aphonia, ataxia, colitis, cranial nerve palsies, deep tendon reflex loss, deafness, diplopia, dysarthria, dysphonia, eosinophilic pneumonia, extravasation (including necrosis), fasciculations, gait abnormal, hemolysis, hemolytic anemia (immuno-allergic), hemolytic uremia syndrome, hepatic failure, hepatitis, hepatotoxicity, hypertension, hypomagnesemia, ileus, INR increased, interstitial lung diseases, interstitial nephritis (acute), intestinal obstruction, Lhermittes' sign, metabolic acidosis, muscle spasm, myoclonus, necrosis (following extravasation), neutropenic fever, optic neuritis, pancreatitis, perisinusoidal fibrosis, prothrombin time increased, ptosis, pulmonary fibrosis, rhabdomyolysis, seizure, thrombocytopenia (immuno-allergic), trigeminal neuralgia, tubular necrosis (acute), veno-occlusive liver disease (sinusoidal obstruction syndrome and perisinusoidal fibrosis), visual acuity decreased, visual field disturbance

Oncology: VesicantIrritant; cases of extravasation have reported necrosis.

Cool compress may be used for immediate management of extravasation, with consideration of potential for peripheral neuropathy exacerbated by cold. Warm compresses will avoid peripheral neuropathy, however, while possibly increasing drug removal through local vasodilation, may increase cellular uptake and injury.

Oncology: Emetic PotentialModerate-to-high (30% to 90%)

Drug Interactions

Cardiac Glycosides: Antineoplastic Agents may decrease the absorption of Cardiac Glycosides. This may only affect digoxin tablets. **Exceptions:** Digitoxin. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Taxane Derivatives: Platinum Derivatives may enhance the myelosuppressive effect of Taxane Derivatives. Administer Taxane derivative before Platinum derivative when given as sequential infusions to limit toxicity. *Risk D: Consider therapy modification*

Topotecan: Platinum Derivatives may enhance the adverse/toxic effect of Topotecan. *Risk D: Consider therapy modification*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Antineoplastic Agents may enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Monitoring ParametersCBC with differential, serum creatinine, liver function tests (including ALT, AST and bilirubin); INR and prothrombin time (in patients on oral anticoagulant therapy); signs of neuropathy, hypersensitivity, and/or respiratory effects; delay dosage until recovery of neutrophils ≥1.5 x 10^9/L and platelets ≥75 x 10^9/L

Nursing: Physical Assessment/MonitoringShould only be administered under the supervision of an experienced cancer chemotherapy physician. Assess potential for interactions with other pharmacological agents. See Administration for infusion specifics. Patient must be observed closely for anaphylactic-like reactions (can occur within minutes of administration; appropriate medications for the treatment of hypersensitivity reactions should be available). Assess for adverse reactions during and between each infusion (eg, pulmonary and hepatic toxicity, neuropathy [acute or persistent], GI disturbance, anemia, chest pain, thromboembolism). Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential, serum creatinine, liver function tests (including ALT, AST and bilirubin); INR and prothrombin time (in patients on oral anticoagulant therapy); delay dosage until recovery of neutrophils ≥1.5 x 10^9/L and platelets ≥75 x 10^9/L

Patient EducationDo not take any new medication during therapy without consulting prescriber. This medication can only be administered by infusion; you will be monitored closely during and following infusion. Report immediately any pain, burning, or swelling at infusion site or any signs of allergic reaction (eg, respiratory difficulty or swallowing, back pain, chest tightness, rash, hives, swelling of lips or mouth). It is important that you maintain adequate nutrition (small, frequent meals may help) and adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause fatigue, headache, insomnia (use caution when driving or engaging in tasks requiring alertness until response to drug in known); nausea, vomiting, loss of appetite, or taste perversion (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help - if nausea/vomiting is unresolved, consult prescriber for approved antiemetic); mouth sores (use soft toothbrush or cotton swabs for mouth care); diarrhea (boiled milk, buttermilk, or yogurt may help); constipation (increased dietary fluid and fiber may help); or loss of hair (reversible). Report any numbness, pain, tingling, or loss of sensation of extremities; chest pain or palpitations; swelling, pain, or hot areas in legs; unusual fatigue; unusual bruising or bleeding; cough, sore throat, or respiratory difficulty; muscle cramps or twitching; or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication. Consult prescriber for appropriate contraceptive measures. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian availability; not available in U.S.

Injection, solution [preservative free]:

Eloxatin®: 5 mg/mL (10 mL, 20 mL, 40 mL)

Injection, powder for reconstitution [preservative free]:

Eloxatin® [CAN]: 50 mg [contains lactose], 100 mg [contains lactose] [not available in U.S.]

Generic AvailableNo

ManufacturerSanofi-Aventis

Mechanism of ActionOxaliplatin, a platinum derivative, is an alkylating agent. Following intracellular hydrolysis, the platinum compound binds to DNA forming cross-links which inhibit DNA replication and transcription, resulting in cell death. Cytotoxicity is cell-cycle nonspecific.

Pharmacodynamics/Kinetics

Distribution: V_d: 440 L

Protein binding: >90% primarily albumin and gamma globulin (irreversible binding to platinum)

Metabolism: Nonenzymatic (rapid and extensive), forms active and inactive derivatives

Half-life elimination: Terminal: 391 hours; Distribution: Alpha phase: 0.4 hours, Beta phase: 16.8 hours

Excretion: Primarily urine (~54%); feces (~2%)

Pharmacotherapy PearlsCold temperature may exacerbate acute neuropathy. Do not use ice for mucositis prophylaxis.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis, dysphagia, mucositis, and taste perversion.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusFatigue is common; may cause insomnia and dizziness

Mental Health: Effects on Psychiatric TreatmentGI side effects are common; use caution with SSRIs. Hematologic side effects are common; use caution with clozapine, carbamazepine, and valproic acid

Index TermsDiaminocyclohexane Oxalatoplatinum; L-OHP; NSC-266046

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(oks AN droe lone)

U.S. Brand NamesOxandrin®

Pharmacologic CategoryAndrogen

Use: Labeled IndicationsAdjunctive therapy to promote weight gain after weight loss following extensive surgery, chronic infections, or severe trauma, and in some patients who, without definite pathophysiologic reasons, fail to gain or to maintain normal weight; to offset protein catabolism with prolonged corticosteroid administration; relief of bone pain associated with osteoporosis

Dosing: Adults**Weight gain (adjunct):** Oral: 2.5-20 mg in divided doses 2-4 times/day based on individual response; a course of therapy of 2-4 weeks is usually adequate. This may be repeated intermittently as needed.

Dosing: Elderly5 mg twice daily

Dosing: Pediatric**Weight gain (adjunct):** Oral: Children: Total daily dose: ≤0.1 mg/kg **or** ≤0.045 mg/lb

Dosing: Renal ImpairmentCaution is recommended because of the propensity of oxandrolone to cause edema and water retention.

Dosing: Hepatic ImpairmentCaution is advised but there are not specific guidelines for dosage reduction.

RestrictionsC-III

ContraindicationsHypersensitivity to oxandrolone or any component of the formulation; nephrosis; carcinoma of breast or prostate; hypercalcemia; pregnancy

Allergy Considerations

- Androgen Allergy

Warnings/Precautions

Boxed warnings:

- Blood lipid changes: See "Concerns related to adverse effects" below.
- Hepatic effects: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Blood lipid changes: **[U.S. Boxed Warning]: May cause blood lipid changes with increased risk of arteriosclerosis.**
- Hepatic effects: **[U.S. Boxed Warning]: Anabolic steroids may cause peliosis hepatis or liver cell tumors which may not be apparent until liver failure or intra-abdominal hemorrhage develops.** Discontinue in case of cholestatic hepatitis with jaundice or abnormal liver function tests.

Disease-related concerns:

- Breast cancer: Use with caution in patients with breast cancer; may cause hypercalcemia by stimulating osteolysis.
- COPD: Use with caution in patients with COPD.
- Diabetes: Use with caution in patients with diabetes mellitus; monitor carefully.
- Edematous conditions: Use with caution in patients with conditions influenced by edema (eg, cardiovascular disease, migraine, seizure disorder, renal impairment); may cause fluid retention.
- Hepatic impairment: Use with caution in patients with hepatic impairment.

Concurrent drug therapy issues:

- Warfarin: Use caution with concomitant warfarin therapy; warfarin dose may need significantly decreased.

Special populations:

- Elderly: Use with caution in elderly patients, they may be at greater risk for prostatic hyperplasia, fluid retention, and transaminase elevations.
- Pediatrics: May accelerate bone maturation without producing compensatory gain in linear growth in children; in prepubertal children perform radiographic examination of the hand and wrist every 6 months to determine the rate of bone maturation and to assess the effect of treatment on the epiphyseal centers.
- Women: Discontinue with evidence of mild virilization in women.

Pregnancy Risk FactorX

Pregnancy ConsiderationsMasculinization of the fetus has been reported.

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsFrequency not defined.

Cardiovascular: Edema

Central nervous system: Depression, excitation, insomnia

Dermatologic: Acne (females and prepubertal males)

Also reported in females: Hirsutism, male-pattern baldness

Endocrine & metabolic: Electrolyte imbalances, glucose intolerance, gonadotropin secretion inhibited, gynecomastia, HDL decreased, LDL increased

Also reported in females: Clitoral enlargement, menstrual irregularities

Genitourinary:

Prepubertal males: Increased or persistent erections, penile enlargement

Postpubertal males: Bladder irritation, epididymitis, impotence, oligospermia, priapism (chronic), testicular atrophy, testicular function inhibited

Hepatic: Alkaline phosphatase increased, ALT increased, AST increased, bilirubin increased, cholestatic jaundice, hepatic necrosis (rare), hepatocellular neoplasms, peliosis hepatis (with long-term therapy)

Neuromuscular & skeletal: CPK increased, premature closure of epiphyses (in children)

Renal: Creatinine excretion increased

Miscellaneous: Bromsulfophthalein retention, habituation, voice alteration (deepening, in females)

Drug Interactions

CycloSPORINE: Androgens may enhance the hepatotoxic effect of CycloSPORINE. Androgens may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Androgens may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Test InteractionsMay suppress factors II, V, VII, and X; may increase PT; may decrease thyroxine-binding globulin and radioactive iodine uptake

Monitoring ParametersLiver function tests, cholesterol profile, hemoglobin/hematocrit; INR/PT in patients on anticoagulant therapy

Children: Radiographs of left wrist every 6 months (to assess bone maturation)

Adult females: Signs of virilization (deepening voice, hirsutism, acne, clitoromegaly); urine and serum calcium in women with breast cancer

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 2.5 mg, 10 mg

Oxandrin®: 2.5 mg, 10 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Oxandrin)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Daypro® may be confused with Diupres®

Oxaprozin may be confused with oxazepam

Pronunciation(oks a PROE zin)

U.S. Brand NamesDaypro®

Canadian Brand NamesApo-Oxaprozin®; Daypro®

Pharmacologic CategoryNonsteroidal Anti-inflammatory Drug (NSAID), Oral

Use: Labeled IndicationsAcute and long-term use in the management of signs and symptoms of osteoarthritis and rheumatoid arthritis; juvenile rheumatoid arthritis

Dosing: Adults

Osteoarthritis: Oral: 600-1200 mg once daily; patients should be titrated to lowest dose possible; patients with low body weight should start with 600 mg daily

Rheumatoid arthritis: Oral: 1200 mg once daily; a one-time loading dose of up to 1800 mg/day or 26 mg/kg (whichever is lower) may be given

Maximum doses:

Patient <50 kg: Maximum: 1200 mg/day

Patient >50 kg with normal renal/hepatic function and low risk of peptic ulcer: Maximum: 1800 mg or 26 mg/kg (whichever is lower) in divided doses

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Juvenile rheumatoid arthritis: Oral:

Note: Individualize to lowest effective dose.

Children 6-16 years:

22-31 kg: 600 mg once daily

32-54 kg: 900 mg once daily

≥55 kg: 1200 mg once daily

Dosing: Renal ImpairmentIn general, NSAIDs are not recommended for use in patients with advanced renal disease but the manufacturer of oxaprozin does provide some guidelines for adjustment in renal dysfunction.

Severe renal impairment or on dialysis: 600 mg once daily; may increase cautiously to 1200 mg/day with close monitoring.

Dosing: Hepatic ImpairmentUse caution in patients with severe dysfunction.

StorageStore at 25°C (77°F). Protect from light; keep bottle tightly closed.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an oral outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to oxaprozin, aspirin, other NSAIDs, or any component of the formulation; perioperative pain in the setting of coronary artery bypass graft (CABG) surgery

Allergy Considerations

- Nonsteroidal Anti-inflammatory Drug (NSAID) Allergy

Warnings/Precautions

Boxed warnings:

- Cardiovascular events: See “Concerns related to adverse effects” below.
- Coronary artery bypass graft surgery: See “Disease-related concerns” below.

- Gastrointestinal events: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Anaphylactoid reactions: Even in patients without prior exposure, anaphylactoid reactions may occur; patients with "aspirin triad" (bronchial asthma, aspirin intolerance, rhinitis) may be at increased risk. Do not use in patients who experience bronchospasm, asthma, rhinitis, or urticaria with NSAID or aspirin therapy.

- Bleeding/hemostasis: Platelet adhesion and aggregation may be decreased; may prolong bleeding time; patients with coagulation disorders or who are receiving anticoagulants should be monitored closely. Anemia may occur; patients on long-term NSAID therapy should be monitored for anemia.

- Cardiovascular events: **[U.S. Boxed Warning]: NSAIDs are associated with an increased risk of adverse cardiovascular thrombotic events, including MI, stroke, and new onset or worsening of pre-existing hypertension.** Risk may be increased with duration of use or pre-existing cardiovascular risk factors or disease. Carefully evaluate individual cardiovascular risk profiles prior to prescribing. Use caution with fluid retention, heart failure, or hypertension. Concurrent administration of ibuprofen, and potentially other nonselective NSAIDs, may interfere with aspirin’s cardioprotective effect. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of cardiovascular events. Alternate therapies should be considered for patients at high risk.

- Gastrointestinal events: **[U.S. Boxed Warning]: NSAIDs may increase risk of gastrointestinal irritation, inflammation, ulceration, bleeding, and perforation.** These events may occur at any time during therapy and without warning. Use caution with a history of GI disease (bleeding or ulcers); concurrent therapy with aspirin, anticoagulants, and/or corticosteroids; smoking; use of alcohol; and the elderly or debilitated patients. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of GI adverse events. Alternate therapies should be considered for patients at high risk.

- Photosensitivity reactions: May cause mild photosensitivity reactions.

- Skin reactions: NSAIDs may cause serious skin adverse events including exfoliative dermatitis, Stevens-Johnson syndrome (SJS), and toxic epidermal necrolysis (TEN); discontinue use at first sign of skin rash or hypersensitivity.

Disease-related concerns:

- Asthma: Do not administer to patients with aspirin-sensitive asthma; severe bronchospasm may occur. Use caution in patients with other forms of asthma.

- Coronary artery bypass graft surgery: **[U.S. Boxed Warning]: Use is contraindicated for treatment of perioperative pain in the setting of coronary artery bypass graft (CABG) surgery.** Risk of MI and stroke may be increased with use following CABG surgery.

- Hepatic impairment: Use with caution in patients with decreased hepatic function. Closely monitor patients with any abnormal LFT. Severe hepatic reactions (eg, fulminant hepatitis, liver failure) have occurred with NSAID use, rarely; discontinue if signs or symptoms of liver disease develop, or if systemic manifestations occur.

- Renal impairment: NSAID use may compromise existing renal function; dose-dependent decreases in prostaglandin synthesis may result from NSAID use, reducing renal blood flow which may cause renal decompensation. Patients with impaired renal function, dehydration, heart failure, liver dysfunction, those taking diuretics, and ACE inhibitors, and the elderly are at greater risk of renal toxicity. Rehydrate patient before starting therapy; monitor renal function closely. Not recommended for use in patients with advanced renal disease. Long-term NSAID use may result in renal papillary necrosis.

Special populations:

- Elderly: The elderly are at increased risk for adverse effects (especially peptic ulceration, CNS effects, renal toxicity) from NSAIDs, even at low doses.

- Pediatrics: Safety and efficacy have not been established in children <6 years of age.

Other warnings/precautions:

- Surgical/dental procedures: Withhold for at least 4-6 half-lives prior to surgical or dental procedures.

Geriatric ConsiderationsElderly are a high-risk population for adverse effects from NSAIDs. As much as 60% of the elderly can develop peptic ulceration and/or hemorrhage asymptomatically. The concomitant use of H_2 blockers and sucralfate is not generally effective as prophylaxis with the exception of NSAID-induced duodenal ulcers which may be prevented by the use of ranitidine. Misoprostol and proton pump inhibitors are the only agents proven to help prevent the development of NSAID-induced ulcers. Also, concomitant disease and drug use contribute to the risk for GI adverse effects. Use lowest effective dose for shortest period possible. Consider renal function decline with age. Use of NSAIDs can compromise existing renal function especially when Cl_{cr} is ≤30 mL/minute. Tinnitus may be a difficult and unreliable indication of toxicity due to age-related hearing loss or eighth cranial nerve damage. CNS adverse effects, such as confusion, agitation, and hallucination, are generally seen in overdose or high dose situations, but the elderly may demonstrate these adverse effects at lower doses than younger adults.

Pregnancy Risk FactorC/D (3rd trimester)

Pregnancy ConsiderationsSafety and efficacy in pregnant women have not been established. Exposure late in pregnancy may lead to premature closure of the ductus arteriosus and may inhibit uterine contractions.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

1% to 10%:

Cardiovascular: Edema

Central nervous system: Confusion, depression, dizziness, headache, sedation, sleep disturbance, somnolence

Dermatologic: Pruritus, rash

Gastrointestinal: Abdominal distress, abdominal pain, anorexia, constipation, diarrhea, flatulence, gastrointestinal ulcer, gross bleeding with perforation, heartburn, nausea, vomiting

Hematologic: Anemia, bleeding time increased

Hepatic: Liver enzyme elevation

Otic: Tinnitus

Renal: Dysuria, renal function abnormal, urinary frequency

<1% (effects reported with oxaprozin or other NSAIDs): Acute interstitial nephritis, acute renal failure, agranulocytosis, alopecia, anaphylaxis, angioedema, anxiety, asthma, blurred vision, bruising, CHF, conjunctivitis, cystitis, dream abnormalities, drowsiness, dyspnea, eosinophilia, erythema multiforme, esophagitis, exfoliative dermatitis, fever, gastritis, GI bleeding, glossitis, hearing decreased, hematemesis, hematuria, hemorrhoidal bleeding, hepatitis, hypersensitivity reaction, hypertension, infection, insomnia, jaundice, leukopenia, liver function abnormalities, malaise, melena, menstrual flow increased/decreased, nephrotic syndrome, nervousness, oliguria, palpitation, pancreatitis, pancytopenia, paresthesia, peptic ulcer, photosensitivity, pneumonia, polyuria, proteinuria, pseudoporphyria, pulmonary infection, purpura, rectal bleeding, renal insufficiency, respiratory depression, sepsis, serum sickness, sinusitis, Stevens-Johnson syndrome, stomatitis, syncope, tachycardia,taste alteration, thrombocytopenia, toxic epidermal necrolysis, tremor, upper respiratory tract infection, vertigo, weakness, weight changes, xerostomia

Drug Interactions

ACE Inhibitors: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Aminoglycosides: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Anticoagulants: Nonsteroidal Anti-Inflammatory Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antiplatelet Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Beta-Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

CycloSPORINE: Nonsteroidal Anti-Inflammatory Agents may enhance the nephrotoxic effect of CycloSPORINE. Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

Desmopressin: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Eplerenone: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Eplerenone. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk D: Consider therapy modification*

HydrALAZINE: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. *Risk X: Avoid combination*

Lithium: Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Methotrexate: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of other Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Pemetrexed: NSAID (Nonselective) may decrease the excretion of Pemetrexed. *Risk D: Consider therapy modification*

Probenecid: May increase the serum concentration of Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Nonsteroidal Anti-Inflammatory Agents may enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Salicylates: NSAID (Nonselective) may enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Choline Magnesium Trisalicylate. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Thiazide Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thrombolytic Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk C: Monitor therapy*

Vancomycin: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Vancomycin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): NSAID (Nonselective) may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may enhance gastric mucosal irritation).

Herb/Nutraceutical: Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American, Panax, Siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAMe (S-adenosylmethionine), sweet clover, turmeric, white willow (all have additional antiplatelet activity).

Test InteractionsFalse-positive urine immunoassay screening tests for benzodiazepines have been reported and may occur several days after discontinuing oxaprozin.

Monitoring ParametersMonitor CBC; hepatic, renal, and ocular function

Nursing: Physical Assessment/MonitoringEvaluate cardiac risk and potential for GI bleeding prior to prescribing this medication. Assess effectiveness and interactions of other medications patient may be taking. Monitor blood pressure at the beginning of therapy and periodically during use. Assess results of laboratory tests, therapeutic effectiveness, and adverse reactions at beginning of therapy and periodically throughout therapy. Schedule ophthalmic evaluations for patients who develop eye complaints during long-term NSAID therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsCBC; hepatic, renal function

Patient EducationTake this medication exactly as directed; do not increase dose without consulting prescriber. Do not crush tablets. Take with food or milk to reduce GI distress. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Do not use alcohol, aspirin or aspirin-containing medication, or any other anti-inflammatory medications without consulting prescriber. You may experience drowsiness, dizziness, or nervousness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); anorexia, nausea, vomiting, or heartburn (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). GI bleeding, ulceration, or perforation can occur with or without pain. Discontinue medication and contact prescriber if persistent abdominal pain, cramping, or blood in stool occurs. Report vaginal bleeding; breathlessness, respiratory difficulty, or unusual cough; chest pain, rapid heartbeat, palpitations; unusual bruising or bleeding (blood in urine, mouth, or vomitus); swollen extremities; skin rash or itching; acute fatigue; or swelling of face, lips, tongue, or throat. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 3rd trimester of pregnancy. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 600 mg

Generic AvailableYes

ManufacturerSearle

Pricing: U.S. (www.drugstore.com)

Tablets (Daypro)

600 mg (60): $142.76

Mechanism of ActionReversibly inhibits cyclooxygenase-1 and 2 (COX-1 and 2) enzymes, which result in decreased formation of prostaglandin precursors; has antipyretic, analgesic, and anti-inflammatory properties

Pharmacodynamics/Kinetics

Absorption: Almost complete

Protein binding: >99%

Metabolism: Hepatic via oxidation and glucuronidation; no active metabolites

Half-life elimination: 40-50 hours

Time to peak: 2-4 hours

Excretion: Urine (5% unchanged, 65% as metabolites); feces (35% as metabolites)

Related Information

- Nonsteroidal Anti-inflammatory Agents

Dental Health: Effects on Dental TreatmentNSAID formulations are known to reversibly decrease platelet aggregation via mechanisms different than observed with aspirin. The dentist should be aware of the potential of abnormal coagulation. Caution should also be exercised in the use of NSAIDs in patients already on anticoagulant therapy with drugs such as warfarin (Coumadin®).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common; may cause nervousness; may rarely cause drowsiness, confusion, insomnia, or depression

Mental Health: Effects on Psychiatric TreatmentMay rarely cause agranulocytosis; use caution with clozapine and carbamazepine; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Cardiovascular Considerations

Blood Pressure: In short-term use, NSAIDs vary considerably in their effect on blood pressure. A meta-analysis (Pope, 1993) showed that indomethacin and naproxen had the largest effect on blood pressure. Other NSAIDs, including piroxicam, ibuprofen, and sulindac had less of an effect. Ibuprofen combined with captopril or losartan may attenuate the antihypertensive effects of ACE inhibition or receptor blockade on sitting or 24-hour ambulatory diastolic blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short.

Heart Failure: The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema. One study showed that NSAID use in elderly patients had an increased risk of hospitalization for heart failure. This study gives compelling reasons to avoid or limit the use of NSAIDs in patients with congestive heart failure, particularly in the elderly population. The ACC/AHA 2005 Heart Failure Guidelines suggest that NSAIDs be avoided or withdrawn whenever possible in patients with current or prior symptoms of heart failure and reduced LVEF.

Risk of Cardiovascular Events: Patients at increased risk of cardiovascular adverse events include patients immediately postoperative (10-14 days) from CABG surgery, and those with existing CAD, CVD, or history of TIA. Prescribers are encouraged to use the lowest effective dose for the shortest duration of time based on individual patient treatment goals. Available evidence reviewed by the FDA does not suggest an increased risk of serious CV events when NSAIDs are given short term and in the lower doses used OTC.

Drug Interactions: Nonsteroidal anti-inflammatory agents, including ibuprofen and naproxen, may diminish the cardioprotective effect of aspirin (Catella-Lawson F, 2001; Capone ML, 2005). It is surmised that ibuprofen may exhibit greater affinity than aspirin for the COX-1 site or if dosed regularly (or prior to aspirin), it would gain access to the active site first. In either case, aspirin's inhibition of COX (irreversible) would be limited in favor of ibuprofen inhibition (reversible). Avoid regular use of NSAIDs (nonselective) if possible. If used occasionally, take after aspirin (immediate release) ingestion.

Anesthesia and Critical Care Concerns/Other ConsiderationsThe 2002 ACCM/SCCM guidelines for analgesia (critically-ill adult) suggest that NSAIDs may be used in combination with opioids in select patients for pain management. Concern about adverse events (increased risk of renal dysfunction, altered platelet function and gastrointestinal irritation) limits its use in patients who have other underlying risks for these events.

In short-term use, NSAIDs vary considerably in their effect on blood pressure. When NSAIDs are used in patients with hypertension, appropriate monitoring of blood pressure responses should be completed and the duration of therapy, when possible, kept short. The use of NSAIDs in the treatment of patients with congestive heart failure may be associated with an increased risk for fluid accumulation and edema; may precipitate renal failure in dehydrated patients.

Medication Safety Issues

Sound-alike/look-alike issues:

Oxazepam may be confused with oxaprozin, quazepam

Serax® may be confused with Eurax®, Urex®, Zyrtec®

International issues:

Murelax® [Australia] may be confused with Miralax™ which is a brand name for polyethylene glycol 3350 in the U.S.

Pronunciation(oks A ze pam)
U.S. Brand NamesSerax®
Canadian Brand NamesApo-Oxazepam®; Bio-Oxazepam; Novoxapram®; Oxpam®; Oxpram®; PMS-Oxazepam; Riva-Oxazepam
Pharmacologic CategoryBenzodiazepine
Use: Labeled IndicationsTreatment of anxiety; management of ethanol withdrawal
Use: Unlabeled/InvestigationalAnticonvulsant in management of simple partial seizures; hypnotic
Dosing: Adults

Anxiety: Oral: 10-30 mg 3-4 times/day

Ethanol withdrawal: Oral: 15-30 mg 3-4 times/day

Hypnotic: Oral: 15-30 mg

Dosing: ElderlyOral: Anxiety: 10 mg 2-3 times/day; increase gradually as needed to a total of 30-45 mg/day. Dose titration should be slow to evaluate sensitivity.
Dosing: Renal ImpairmentNot dialyzable (0% to 5%)
Administration: OralGive orally in divided doses
RestrictionsC-IV
ContraindicationsHypersensitivity to oxazepam or any component of the formulation (cross-sensitivity with other benzodiazepines may exist); narrow-angle glaucoma (not in product labeling, however, benzodiazepines are contraindicated); not indicated for use in the treatment of psychosis; pregnancy
Allergy Considerations

- Benzodiazepine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anterograde amnesia: Benzodiazepines have been associated with anterograde amnesia.
- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hypotension: May cause hypotension (rare); use with caution in patients with cardiovascular or cerebrovascular disease, or in patients who would not tolerate transient decreases in blood pressure.
- Paradoxical reactions: Paradoxical reactions, including hyperactive or aggressive behavior, have been reported with benzodiazepines, particularly in adolescent/pediatric or psychiatric patients.

Disease-related concerns:

- Depression: Use caution in patients with depression, particularly if suicidal risk may be present.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Impaired gag reflux: Use with caution in patients with an impaired gag reflux.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with respiratory disease.

Concurrent drug therapy issues:

- CNS depressants/psychoactive medications: Use with caution in patients receiving other CNS depressants or psychoactive medication; effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Debilitated patients: Use with caution in debilitated patients.
- Elderly: Use with caution in the elderly; benzodiazepines have been associated with falls and traumatic injury.
- Fall risk: Use with extreme caution in patients who are at risk of falls; benzodiazepines have been associated with falls and traumatic injury.
- Pediatrics: Safety and efficacy in established in pediatric patients <6 years of age; dose has not been established between 6-12 years of age.

Dosage form specific issues:

- Tartrazine: Serax® 15 mg tablet contains tartrazine.

Other warnings/precautions:

- Appropriate use: Does not have analgesic, antidepressant, or antipsychotic properties.
- Withdrawal: Rebound or withdrawal symptoms may occur following abrupt discontinuation or large decreases in dose. Use caution when reducing dose or withdrawing therapy; decrease slowly and monitor for withdrawal symptoms. Flumazenil may cause withdrawal in patients receiving long-term benzodiazepine therapy.

Geriatric ConsiderationsBecause of its relatively short half-life and its lack of active metabolites, oxazepam is recommended for use in the elderly when a benzodiazepine is indicated.
Pregnancy Risk FactorD
LactationEnters breast milk/not recommended
Adverse ReactionsFrequency not defined.

Cardiovascular: Syncope (rare), edema

Central nervous system: Drowsiness, ataxia, dizziness, vertigo, memory impairment, headache, paradoxical reactions (excitement, stimulation of effect), lethargy, amnesia, euphoria

Dermatologic: Rash

Endocrine & metabolic: Decreased libido, menstrual irregularities

Genitourinary: Incontinence

Hematologic: Leukopenia, blood dyscrasias

Hepatic: Jaundice

Neuromuscular & skeletal: Dysarthria, tremor, reflex slowing

Ocular: Blurred vision, diplopia

Miscellaneous: Drug dependence

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Clozapine: Benzodiazepines may enhance the adverse/toxic effect of Clozapine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Phenytoin: Benzodiazepines may increase the serum concentration of Phenytoin. Short-term exposure to benzodiazepines may not present as much risk as chronic therapy. *Risk C: Monitor therapy*

Theophylline Derivatives: May diminish the therapeutic effect of Benzodiazepines. *Risk D: Consider therapy modification*

Yohimbine: May diminish the therapeutic effect of Antianxiety Agents. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersRespiratory and cardiovascular status
Reference RangeTherapeutic: 0.2-1.4 mcg/mL (SI: 0.7-4.9 µmol/L)
Nursing: Physical Assessment/MonitoringAssess other medications the patient may be taking for effectiveness and interactions. Assess for history of addiction; long-term use can result in dependence, abuse, or tolerance; periodically evaluate need for continued use. For inpatient use, institute safety measures and monitor effectiveness and adverse reactions. For outpatients, monitor therapeutic effectiveness and

adverse reactions at beginning of therapy and periodically with long-term use. Can cause CNS depression (dose-related); monitor for sedation, dizziness, confusion, or ataxia which may impair physical and mental capabilities. Be alert to the possibility of suicide ideation. Taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake exactly as directed; do not increase dose or frequency. It may take 2-3 weeks to achieve desired results. Drug may cause physical and/or psychological dependence. Do not use alcohol or other prescription or OTC medications (especially pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, lightheadedness, impaired coordination, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, or dry mouth (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); altered sexual drive or ability (reversible); or photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight). Report persistent CNS effects (eg, confusion, depression, thoughts of suicide, increased sedation, excitation, headache, agitation, insomnia or nightmares, dizziness, fatigue, impaired coordination, changes in personality, or changes in cognition); changes in urinary pattern; muscle cramping, weakness, tremors, or rigidity; ringing in ears or visual disturbances; chest pain, palpitations, or rapid heartbeat; excessive perspiration, excessive GI symptoms (cramping, constipation, vomiting, anorexia); or worsening of condition. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication; use appropriate contraceptive measures. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 10 mg, 15 mg, 30 mg

Tablet: 15 mg [contains tartrazine]

Generic AvailableYes: Capsule

Pricing: U.S. (www.drugstore.com)

Capsules (Oxazepam)

10 mg (30): $17.99

15 mg (30): $21.99

30 mg (30): $35.99

Capsules (Serax)

10 mg (30): $32.99

Mechanism of ActionBinds to stereospecific benzodiazepine receptors on the postsynaptic GABA neuron at several sites within the central nervous system, including the limbic system, reticular formation. Enhancement of the inhibitory effect of GABA on neuronal excitability results by increased neuronal membrane permeability to chloride ions. This shift in chloride ions results in hyperpolarization (a less excitable state) and stabilization.

Pharmacodynamics/Kinetics

Absorption: Almost complete

Protein binding: 86% to 99%

Metabolism: Hepatic to inactive compounds (primarily as glucuronides)

Half-life elimination: 2.8-5.7 hours

Time to peak, serum: 2-4 hours

Excretion: Urine (as unchanged drug (50%) and metabolites)

- Teratogenic Risks of Psychotropic Medications

Pharmacotherapy PearlsNot intended for management of anxieties and minor distresses associated with everyday life. Treatment longer than 4 months should be re-evaluated to determine the patient's need for the drug. Abrupt discontinuation after sustained use (generally >10 days) may cause withdrawal symptoms.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health CommentIn 2007, the FDA requested that all manufacturers of sedative-hypnotic drug products revise labeling to include a greater emphasis on the risks of adverse effects. These risks include severe allergic reactions (anaphylaxis, angioedema) and complex sleep-related behaviors, which may include sleep-driving (driving while not fully awake and with no memory of the event), making phone calls, and preparing and eating food while asleep.

There are two subtypes of GABA receptors (GABA-A and GABA-B) and three different benzodiazepine receptors (Bz_1, Bz_2, and Bz_3). Benzodiazepine receptors and effects appear to be linked to the GABA-A receptors. Benzodiazepines do not bind to GABA-B receptors. The role of GABA-B receptors is unclear. Benzodiazepines have no specificity for benzodiazepine receptor subtypes.

Oxazepam is a short half-life benzodiazepine. Duration of action after a single dose is determined by redistribution rather than metabolism.

Tolerance develops to the sedative, hypnotic, and anticonvulsant effects. It does not develop to the anxiolytic or skeletal muscle relaxing effects. Psychological and physical dependence may occur with prolonged use of benzodiazepines. The onset of withdrawal symptoms is usually seen on the first day without drug and lasts 5-7 days in patients receiving short half-life benzodiazepines, whereas, the onset occurs after 5 days with a duration of 10-14 days after abrupt discontinuance of long half-life benzodiazepines. Risk factors for abuse include personal or family history of substance abuse and personality disorder. Oxazepam undergoes phase II metabolism and, therefore, is less likely to be affected in patients with hepatic dysfunction.

Anesthesia and Critical Care Concerns/Other Considerations Not intended for management of anxieties and minor distresses associated with everyday life; treatment >4 months should be re-evaluated to determine the patient's need for the drug. Chronic use of this agent may increase the perioperative benzodiazepine dose needed to achieve desired effect. Abrupt discontinuation after sustained use (generally >10 days) may cause withdrawal symptoms.

Antiepileptics: Increased Risk of Suicidal Behavior or Ideation - Updated: December 2008

The U.S. Food and Drug Administration (FDA) has issued an update following the completion of its analysis concerning the risk of suicidality (suicidal behavior or ideation) observed during clinical trials of various antiepileptic drugs (compared to placebo) in the treatment of epilepsy, psychiatric disorders, and other conditions. The pooled analysis of 199 clinical trials involving 11 antiepileptic drugs (carbamazepine, divalproex sodium, felbamate, gabapentin, lamotrigine, levetiracetam, oxcarbazepine, pregabalin, tiagabine, topiramate, zonisamide) as either monotherapy or as adjuvant therapy showed that patients receiving an antiepileptic had a 0.43% risk of suicidal behavior/ideation compared to 0.24% of patients receiving placebo. As a result of the findings, the FDA will require that the product labeling of the entire class of antiepileptics include a warning concerning the risk of suicidality, and a medication guide be developed informing patients of this risk.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antiepileptic

Medication Safety Issues

Sound-alike/look-alike issues:

OXcarbazepine may be confused with carBAMazepine

Trileptal® may be confused with TriLipix™

Pronunciation(ox car BAZ e peen)

U.S. Brand NamesTrileptal®

Canadian Brand NamesTrileptal®

Pharmacologic CategoryAnticonvulsant, Miscellaneous

Use: Labeled IndicationsMonotherapy or adjunctive therapy in the treatment of partial seizures in adults and children ≥4 years of age with epilepsy; adjunctive therapy in the treatment of partial seizures in children ≥2 years of age with epilepsy

Use: Unlabeled/InvestigationalBipolar disorder; treatment of neuropathic pain

Dosing: Adults

Adjunctive therapy, partial seizures (epilepsy): Oral: Initial: 300 mg twice daily; dosage may be increased by 600 mg/day at approximate weekly intervals. Recommended daily dose is 1200 mg/day in 2 divided doses. Although daily doses >1200 mg/day were somewhat more efficacious, most patients were unable to tolerate 2400 mg/day (due to CNS effects).

Conversion to monotherapy, partial seizures (epilepsy): Oral: Patients receiving concomitant antiepileptic drugs (AEDs): Initial: 300 mg twice daily while simultaneously reducing the dose of concomitant AEDs. Withdraw concomitant AEDs completely over 3-6 weeks, while increasing the oxcarbazine dose in increments of 600 mg/day at weekly intervals, reaching the maximum oxcarbazine dose (2400 mg/day) in about 2-4 weeks (lower doses have been effective in patients in whom monotherapy has been initiated).

Initiation of monotherapy, partial seizures (epilepsy): Oral: Patients not receiving prior AEDs: 300 mg twice daily (total dose 600 mg/day). Increase dose by 300 mg/day every third day to a dose of 1200 mg/day. Higher dosages (2400 mg/day) have been shown to be effective in patients converted to monotherapy from other AEDs.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Adjunctive treatment, partial seizures (epilepsy): Oral: Children 2-3 years:

Initial: 8-10 mg/kg/day (not to exceed 600 mg/day) given in a twice daily regimen.

Maintenance: The target maintenance dose should be achieved over 2 weeks, and depends on weight of the child:

<20 kg: 600 mg/day in 2 divided doses; consider initiating dose at 16-20 mg/kg/day; maximum maintenance dose should be achieved over 2-4 weeks and should not exceed 60 mg/kg/day

Adjunctive treatment, partial seizures (epilepsy): Oral: Children 4-16 years:

Initial: 8-10 mg/kg/day (not to exceed 600 mg/day) given in a twice daily regimen.

Maintenance: The target maintenance dose should be achieved over 2 weeks, and depends on weight of the child:

20-29 kg: 900 mg/day in 2 divided doses

29.1-39 kg: 1200 mg/day in 2 divided doses

>39 kg: 1800 mg/day in 2 divided doses

Conversion to monotherapy: Children 4-16 years: Oxcarbazepine 8-10 mg/kg/day in twice daily divided doses, while simultaneously initiating the reduction of the dose of the concomitant antiepileptic drug; the concomitant drug should be withdrawn over 3-6 weeks. Oxcarbazepine dose may be increased by a maximum of 10 mg/kg/day at weekly intervals. See below for recommended total daily dose by weight.

Initiation of monotherapy: Children 4-16 years: Oxcarbazepine should be initiated at 8-10 mg/kg/day in twice daily divided doses; doses may be titrated by 5 mg/kg/day every third day. See below for recommended total daily dose by weight.

Range of maintenance doses by weight during monotherapy:

20 kg: 600-900 mg/day

25-30 kg: 900-1200 mg/day

35-40 kg: 900-1500 mg/day

45 kg: 1200-1500 mg/day

50-55 kg: 1200-1800 mg/day

60-65 kg: 1200-2100 mg/day

70 kg: 1500-2100 mg/day

Dosing: Renal ImpairmentCl_{cr} <30 mL/minute: Therapy should be initiated at one-half the usual starting dose (300 mg/day in adults) and increased slowly to achieve the desired clinical response

Dosing: Hepatic ImpairmentAdjustment not needed for mild-to-moderate impairment. No data in patients with severe impairment.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralSuspension: Prior to using for the first time, firmly insert the plastic adapter provided with the bottle. Cover adapter with child-resistant cap when not in use. Shake bottle for at least 10 seconds, remove child-resistant cap, and insert the oral dosing syringe provided to withdraw appropriate dose. Dose may be taken directly from oral syringe or may be mixed in a small glass of water immediately prior to swallowing. Rinse syringe with warm water after use and allow to dry thoroughly. Discard any unused portion after 7 weeks of first opening bottle.

Dietary ConsiderationsMay be taken with or without food.

StorageStore tablets and suspension at 25°C (77°F). Use suspension within 7 weeks of first opening container.

ContraindicationsHypersensitivity to oxcarbazepine or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: Use has been associated with CNS-related adverse events, most significant of these were cognitive symptoms including psychomotor slowing, difficulty with concentration, and speech or language problems, somnolence or fatigue, and coordination abnormalities, including ataxia and gait disturbances. Caution patients about performing tasks which require mental alertness (eg, operating machinery or driving).

- Dermatologic reactions: Potentially serious, sometimes fatal, dermatologic reactions (eg, Stevens-Johnson, toxic epidermal necrolysis) have been reported in adults and children; monitor for signs and symptoms of skin reactions; discontinuation and conversion to alternate therapy may be required.

- Hypersensitivity reactions: Rare cases of anaphylaxis and angioedema have been reported, even after initial dosing; permanently discontinue should symptoms occur. Use caution in patients with previous hypersensitivity to carbamazepine (cross-sensitivity occurs in 25% to 30%). Potentially serious, sometimes fatal multiorgan hypersensitivity reactions have also been reported; monitor for signs and symptoms of possible disparate manifestations associated with lymphatic, hepatic, renal, and/or hematologic organ systems; discontinuation and conversion to alternate therapy may be required.

- Hyponatremia: Clinically-significant hyponatremia (sodium <125 mmol/L) can develop during use; monitor serum sodium, particularly during the first 3 months of therapy or in patients at risk for hyponatremia.

Disease-related concerns:

Renal impairment: Single-dose studies show that half-life of the primary active metabolite is prolonged 3-4 fold and AUC is doubled in patients with Cl_{cr} <30 mL/minute; dose adjustment required in these patients.

Concurrent drug therapy issues:

- Oral contraceptives: May reduce the efficacy of oral contraceptives; nonhormonal contraceptive measures are recommended.

- Sedatives: Effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Pediatric: Safety and efficacy in children <2 years of age have not been established.

Other warnings/precautions:

- Withdrawal: Anticonvulsants should not be discontinued abruptly because of the possibility of increasing seizure frequency; therapy should be withdrawn gradually to minimize the potential of increased seizure frequency, unless safety concerns require a more rapid withdrawal.

Geriatric ConsiderationsStudies in elderly volunteers (60-82 years of age) with both single dose (300 mg) and multiple doses (600 mg/day) reported maximum plasma concentrations and AUC as being 30% to 60% higher than younger volunteers (18-32 years of age). These results were due to differences in creatinine clearance between the two groups. Since elderly may have Cl_{cr} <30 mL/minute, dose reductions may be needed.

Pregnancy Risk FactorC

Pregnancy ConsiderationsOxcarbazepine crosses the human placenta. Teratogenic effects have been observed in animal studies. There are no adequate and well-controlled studies in pregnant women; however, oxcarbazepine is structurally related to carbamazepine (teratogenic in humans); use during pregnancy only if the benefit to the mother outweighs the potential risk to the fetus. Nonhormonal forms of contraception should be used during therapy.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsOxcarbazepine and its active metabolite (MHD) are excreted in human breast milk. A milk-to-plasma concentration ratio of 0.5 was found for both. Because of the potential for serious adverse reactions to oxcarbazepine in nursing infants, a decision should be made whether to discontinue nursing or to discontinue the drug in nursing women.

Adverse ReactionsAs reported in adults with doses of up to 2400 mg/day (includes patients on monotherapy, adjunctive therapy, and those not previously on AEDs); incidence in children was similar.

>10%:

Central nervous system: Dizziness (22% to 49%), somnolence (20% to 36%), headache (13% to 32%), ataxia (5% to 31%), fatigue (12% to 15%), vertigo (6% to 15%)

Gastrointestinal: Vomiting (7% to 36%), nausea (15% to 29%), abdominal pain (10% to 13%)

Neuromuscular & skeletal: Abnormal gait (5% to 17%), tremor (3% to 16%)

Ocular: Diplopia (14% to 40%), nystagmus (7% to 26%), abnormal vision (4% to 14%)

1% to 10%:

Cardiovascular: Hypotension (1% to 2%), leg edema (1% to 2%)

Central nervous system: Nervousness (2% to 5%), amnesia (4%), abnormal thinking (2% to 4%), insomnia (2% to 4%), speech disorder (1% to 3%), EEG abnormalities (2%), abnormal feelings (1% to 2%), agitation (1% to 2%), confusion (1% to 2%)

Dermatologic: Rash (4%), acne (1% to 2%)

Endocrine & metabolic: Hyponatremia (1% to 3%)

Gastrointestinal: Diarrhea (5% to 7%), dyspepsia (5% to 6%), constipation (2% to 6%), gastritis (1% to 2%), weight gain (1% to 2%)

Neuromuscular & skeletal: Weakness (3% to 6%), back pain (4%), falling down (4%), abnormal coordination (1% to 4%), dysmetria (1% to 3%), sprains/strains (2%), muscle weakness (1% to 2%)

Ocular: Abnormal accommodation (2%)

Respiratory: Upper respiratory tract infection (7%), rhinitis (2% to 5%), chest infection (4%), epistaxis (4%), sinusitis (4%)

Postmarketing and/or case reports (limited to important or life-threatening): Aggressive reaction, amylase increased, anaphylaxis, angioedema, aphasia, asthma, aura, biliary pain, blood in stool, bradycardia, bruising, cardiac failure, cataract, cerebral hemorrhage, chest pain, cholelithiasis, colitis, conjunctival hemorrhage, consciousness decreased, convulsions aggravated, delirium, delusion, duodenal ulcer, dysphagia, dysphonia, dyspnea, dystonia, dysuria, emotional lability, enteritis, erythema multiforme, erythematosus rash, esophagitis, eye edema, extrapyramidal disorder, facial rash, gastric ulcer, GGT increased, gingival bleeding, hematuria, hemianopia, hemiplegia, hematemesis, hot flushes, hyper-/hypoglycemia, hyper-/hypokinesia, hyper-/hyporeflexia, hypersensitivity reaction, hyper-/hypotonia, hypertension, hypocalcemia, hypochondrium pain, hypoesthesia, hypokalemia, hysteria, intermenstrual bleeding, laryngismus, leukopenia, leukorrhea, lipase increased, liver enzymes elevated, maculopapular rash, manic reaction, migraine, menorrhagia, multiorgan hypersensitivity (eosinophilia, arthralgia, rash, fever, lymphadenopathy), muscle contractions (involuntary), mydriasis, neuralgia, oculogyric crisis, otitis externa, palpitation, pancreatitis, panic disorder, paralysis, paroniria, photophobia, photosensitivity reaction, pleurisy, postural hypotension, priapism, purpura, psychosis, ptosis, rectal hemorrhage, renal calculus, renal pain, rigors, scotoma, sialoadenitis, Stevens-Johnson syndrome, stupor, suicidal behavior/ideation, syncope, systemic lupus erythematosus, tachycardia, tetany, thrombocytopenia, toxic epidermal necrolysis, ulcerative stomatitis, urinary tract pain, urticaria, vitiligo, weight loss, xerophthalmia

Metabolism/Transport Effects**Inhibits** CYP2C19 (weak); **Induces** CYP3A4 (strong)

Drug Interactions

CYP3A4 Substrates: CYP3A4 Inducers (Strong) may increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Nilotinib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nisoldipine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nisoldipine. *Risk X: Avoid combination*

Oral Contraceptive (Estrogens): OXcarbazepine may decrease the serum concentration of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Oral Contraceptive (Progestins): OXcarbazepine may decrease the serum concentration of Oral Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

PHENobarbital: May decrease the serum concentration of OXcarbazepine. *Risk C: Monitor therapy*

Phenytoin: May decrease the serum concentration of OXcarbazepine. OXcarbazepine may increase the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Ranolazine. *Risk X: Avoid combination*

Sorafenib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Sorafenib. *Risk D: Consider therapy modification*

Valproic Acid: May decrease the serum concentration of OXcarbazepine. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: St John's wort may decrease oxcarbazepine levels. Avoid evening primrose (seizure threshold decreased). Avoid valerian, St John's wort, kava kava, gotu kola.

Test InteractionsThyroid function tests may depress serum T_4 without affecting T_3 levels or TSH.

Monitoring ParametersSeizure frequency, serum sodium (particularly during first 3 months of therapy), symptoms of CNS depression (dizziness, headache, somnolence). Additional serum sodium monitoring recommended during maintenance treatment in patients receiving other medications known to decrease sodium levels, in patients with signs/symptoms of hyponatremia, and in patients with an increase in seizure frequency or severity.

Nursing: Physical Assessment/MonitoringAssess complete allergy history (carbamazepine). Assess effectiveness and interactions of other medications. Monitor therapeutic effectiveness (seizure activity, frequency, duration, type), laboratory results, and adverse reactions (eg, sedation, CNS changes, visual changes). Monitor for skin reactions. Dosage should be tapered when discontinuing to reduce risk of increased seizures. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse reactions to report. **Note:** Oxcarbazepine may reduce the effectiveness of oral contraceptives; nonhormonal contraception is recommended.

Monitoring: Lab TestsSerum sodium (particularly during first 3 months of therapy); additional serum sodium monitoring is recommended during maintenance treatment in patients receiving other medications known to decrease sodium levels, in patients with signs/symptoms of hyponatremia, and in patients with an increase in seizure frequency or severity.

Patient EducationDo not increase dose or frequency or discontinue without consulting prescriber. While using the medication, do not use alcohol and other prescription or OTC medications (especially medications to relieve pain, induce sleep, reduce anxiety, treat or prevent cold, coughs, or allergies) unless approved by prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea or vomiting (small frequent meals, good mouth care, chewing gum, or sucking hard candy may help, or contact prescriber). Report CNS changes, increase in seizure frequency or severity, mentation changes, suicidal ideation, depression, changes in cognition or memory, persistent fever, acute fatigue or weakness, or insomnia; muscle cramping, weakness, or abdominal pain; rash or skin irritations; unusual bruising or bleeding (mouth, urine, stool); swelling of extremities; or other adverse response. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. **Note:** Oxcarbazepine may reduce the effectiveness of oral contraceptives; nonhormonal contraception is recommended. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Suspension, oral:

Trileptal®: 300 mg/5 mL (250 mL) [contains ethanol; packaged with oral syringe]

Tablet: 150 mg, 300 mg, 600 mg

Trileptal®: 150 mg, 300 mg, 600 mg

Generic AvailableYes: Tablet

ManufacturerNovartis Pharmaceuticals Corp

Pricing: U.S. (www.drugstore.com)

Suspension (Trileptal)

300 mg/5 mL (250): $155.23

Tablets (Oxcarbazepine)

150 mg (30): $45.99

300 mg (60): $129.99

600 mg (60): $259.98

Tablets (Trileptal)

150 mg (60): $98.74

300 mg (60): $175.98

600 mg (60): $329.96

Mechanism of ActionPharmacological activity results from both oxcarbazepine and its monohydroxy metabolite (MHD). Precise mechanism of anticonvulsant effect has not been defined. Oxcarbazepine and MHD block voltage-sensitive sodium channels, stabilizing hyperexcited neuronal membranes, inhibiting repetitive firing, and decreasing the propagation of synaptic impulses. These actions are believed to prevent the spread of seizures. Oxcarbazepine and MHD also increase potassium conductance and modulate the activity of high-voltage activated calcium channels.

Pharmacodynamics/Kinetics

Absorption: Complete; food has no affect on rate or extent

Distribution: MHD: V_d: 49 L

Protein binding, serum: MHD: 40%

Metabolism: Hepatic to 10-monohydroxy metabolite (MHD; active); MHD is further glucuronidated or oxidized to a 10,11-dihydroxy metabolite (DHD; inactive)

Bioavailability: Decreased in children <8 years; increased in elderly >60 years

Half-life elimination: Parent drug: 2 hours; MHD: 9 hours; renal impairment (Cl_{cr} 30 mL/minute): MHD: 19 hours

Clearance of MHD is increased in younger children (~80% in children 2-4 years of age) and approaches that of adults by ~13 years of age

Time to peak, serum (median): Tablets: 4.5 hours; oral suspension: 6 hours

Excretion: Urine (95%, <1% as unchanged oxcarbazepine, 27% as unchanged MHD, 49% as MHD glucuronides); feces (<4%)

Related Information

- Anticonvulsants by Seizure Type

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health Comment Oxcarbazepine has been associated with psychomotor slowing, difficulty with concentration, speech or language problems, sedation, ataxia, and gait disturbances. Because this agent is the 10-keto analog of carbamazepine, it is often considered useful for the management of bipolar disorder. However, there is a paucity of research data supporting this usage.

Canadian Brand NamesOxistat®
Pharmacologic CategoryAntifungal Agent, Topical
Use: Labeled IndicationsTreatment of tinea pedis (athlete's foot), tinea cruris (jock itch), tinea corporis (ringworm), and tinea (pityriasis) versicolor
Dosing: Adults

Tinea corporis/tinea cruris: Topical: Cream, lotion: Apply to affected areas 1-2 times daily for 2 weeks

Tinea pedis: Topical: Cream, lotion: Apply to affected areas 1-2 times daily for 1 month

Tinea versicolor: Topical: Cream: Apply to affected areas once daily for 2 weeks

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Tinea corporis, tinea cruris, tinea pedis, tinea versicolor:** Topical: Cream, lotion: Refer to adult dosing.
StorageStore between 15°C to 30°C (59°F to 86°F). Shake lotion well before use.
ContraindicationsHypersensitivity to oxiconazole or any component of the formulation
Allergy Considerations

- Azole Antifungal Allergy

Warnings/Precautions

Concerns related to adverse effects:

• Irritation: Discontinue if sensitivity or irritation occurs

Special population:

Pediatrics: Efficacy has been established in children, however, the occurrence of the approved indications in children <12 years of age is rare

Other warnings/precautions:

• Appropriate use: For topical use only; avoid contact with eyes or vagina

Pregnancy Risk FactorB
Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate or well-controlled studies in pregnant women.
LactationEnters breast milk/use caution
Breast-Feeding ConsiderationsSystemic absorption is low, however, the manufacturer reports that oxiconazole is excreted in breast milk.
Adverse Reactions

1% to 10%:

Dermatologic: Pruritus (<2%)

Local: Burning (≤1%)

<1%: Allergic contact dermatitis, dyshidrotic eczema, erythema, fissure, folliculitis, irritation, maceration, nodules, pain, papules, rash, scaling, stinging, tingling

Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

StorageStore at 30°C (86°F). Protect from heat.
RestrictionsNot available in U.S.
ContraindicationsHypersensitivity to oxprenolol or any component of the formulation; history of allergic rhinitis, asthma, or allergic bronchospasm; sinus bradycardia; greater that first degree AV block; sick sinus syndrome; right ventricular failure secondary to pulmonary hypertension; congestive heart failure; cardiogenic shock; anesthesia with agents that produce myocardial depression; pregnancy (similar agents); breast-feeding
Allergy Considerations

- Beta-Blocker Allergy

Warnings/Precautions

Concerns related to adverse events:

- Anaphylactic reactions: Use caution with history of severe anaphylaxis to allergens; patients taking beta-blockers may become more sensitive to repeated challenges. Treatment of anaphylaxis (eg, epinephrine) in patients taking beta-blockers may be ineffective or promote undesirable effects.

Disease-related concerns:

- Bronchospastic disease: In general, patients with bronchospastic disease should not receive beta-blockers; if used at all, should be used cautiously with close monitoring.
- Conduction abnormality: Consider pre-existing conditions such as sick sinus syndrome before initiating.
- Diabetes: Use with caution in patients with diabetes mellitus; may potentiate hypoglycemia and/or mask signs and symptoms.
- Heart failure (HF): Use with caution in patients with compensated heart failure and monitor for a worsening of the condition.
- Hepatic impairment: Use with caution in patients with severe hepatic insufficiency or inflammatory diseases; increased serum concentrations have been noted.
- Myasthenia gravis: Use with caution in patients with myasthenia gravis.
- Peripheral vascular disease (PVD): Use with caution in patients with PVD (including Raynaud's).
- Pheochromocytoma (untreated): Adequate alpha-blockade is required prior to use of any beta-blocker.
- Psychiatric disease: Use with caution in patients with a history of psychiatric illness; may cause or exacerbate CNS depression.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Abrupt withdrawal: Beta-blocker therapy should not be withdrawn abruptly (particularly in patients with CAD), but gradually tapered to avoid acute tachycardia, hypertension, and/or ischemia.

Pregnancy Risk FactorNot assigned (similar agents rated C/D)
Pregnancy ConsiderationsOxprenolol crosses the placental barrier and may cause bradycardia in the fetus and newborn infants.
LactationEnters breast milk/not recommended
Adverse ReactionsFrequency not defined.

Cardiovascular: CHF, pulmonary edema, cardiac enlargement, postural hypotension, severe bradycardia, lengthening of PR interval, second-

and third-degree AV block, sinus arrest, palpitation, chest pain; peripheral vascular disorders, Raynaud's phenomenon, claudication, hot flashes, syncope

Central nervous system: Vertigo, lightheadedness, headache, dizziness, anxiety, mental depression, nervousness, irritability, hallucinations, sleep disturbances, nightmares, insomnia, sedation, vivid dreams, slurred speech

Dermatological: Dry skin, rash, pruritus

Endocrine & metabolic: Libido decreased, impotence, weight gain, hypoglycemia

Gastrointestinal: Diarrhea, constipation, flatulence, heartburn, anorexia, nausea, vomiting, abdominal pain, dry mouth

Hematological: Thrombocytopenia, leukopenia

Hepatic: Alkaline phosphatase increased, bilirubin increased, transaminases increased

Neuromuscular & skeletal: Paresthesia, weakness

Ocular: Keratoconjunctivitis, dry eyes, itching eyes, blurred vision

Otic: Tinnitus

Renal: BUN increased

Respiratory: Dyspnea, wheezing, bronchospasm, nasal congestion, status asthmaticus

Miscellaneous: Diaphoresis, exertional tiredness

Metabolism/Transport Effects **Inhibits** CYP2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Beta-Blockers may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Blockers: Beta-Blockers may enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. *Risk D: Consider therapy modification*

Alpha2-Agonists: Beta-Blockers may enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Aminoquinolines (Antimalarial): May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Amiodarone: May enhance the bradycardic effect of Beta-Blockers. Possibly to the point of cardiac arrest. Amiodarone may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Beta-Blockers. Beta-Blockers may decrease the metabolism of Antipsychotic Agents (Phenothiazines). Antipsychotic Agents (Phenothiazines) may decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Barbiturates: May decrease the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Beta2-Agonists: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Beta-Blockers. Bradycardia and signs of heart failure have also been reported. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Cardiac Glycosides: Beta-Blockers may enhance the bradycardic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dipyridamole: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Disopyramide: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Insulin: Beta-Blockers may enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Lidocaine: Beta-Blockers may decrease the metabolism of Lidocaine. *Risk C: Monitor therapy*

Methacholine: Beta-Blockers may enhance the adverse/toxic effect of Methacholine. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Beta-Blockers may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Propafenone: May decrease the metabolism of Beta-Blockers. Propafenone possesses some independent beta blocking activity. *Risk C: Monitor therapy*

Propoxyphene: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Reserpine: May enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Beta-Blockers. **Exceptions:** Rifabutin. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Fluvoxamine. *Risk C: Monitor therapy*

Theophylline Derivatives: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Theophylline Derivatives. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid dong quai if using for hypertension (has estrogenic activity). Avoid ephedra, yohimbe, ginseng (may worsen hypertension).

Monitoring ParametersBlood pressure, heart rate; monitor weight and fluid balance; monitor blood glucose closely in patients with diabetes

Monitoring: Lab TestsMonitor blood glucose in patients with diabetes.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet (Trasicor®): 40 mg, 80 mg

Generic AvailableNo

ManufacturerNovartis (Canada)

Mechanism of ActionOxprenolol has a competitive ability to antagonize catecholamine-induced tachycardia at the beta-receptor sites in the heart, thus decreasing cardiac output; inhibits of renin release by the kidneys, and inhibits the vasomotor centers.

Pharmacodynamics/Kinetics

Duration of beta-blocking effects: Immediate-release tablet: 8-12 hours

Absorption: 20% to 70%

Distribution: 1.3 L/kg

Protein binding: 80%

Metabolism: Hepatic first-pass effect

Half-life elimination: 1.3-1.5 hours

Time to peak, serum: Immediate-release tablet: 0.5-1.5 hours

Excretion: Urine (as inactive metabolites, <5% as unchanged drug); major metabolite is glucuronide

Pharmacotherapy PearlsNot available in U.S.

Dental Health: Effects on Dental TreatmentNonselective beta-blockers may enhance the pressor response to epinephrine, resulting in hypertension and bradycardia. Many nonsteroidal anti-inflammatory drugs, such as ibuprofen and indomethacin, can reduce the hypotensive effect of beta-blockers after 3 or more weeks of therapy with the NSAID. Short-term NSAID use (ie, 3 days) requires no special precautions in patients taking beta-blockers.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause anxiety, dizziness, depression, nervousness, irritability, insomnia, hallucinations, sedation, or vivid dreams

Mental Health: Effects on Psychiatric TreatmentConcomitant use with psychotropic agents may produce additive sedative effects

Index TermsOxprenolol Hydrochloride

Oxybutynin

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Oxybutynin may be confused with OxyContin®

Ditropan® may be confused with Detrol®, diazepam, Diprivan®, dithranol

Transdermal patch may contain conducting metal (eg, aluminum); remove patch prior to MRI.

Pronunciation(oks i BYOO ti nin)
U.S. Brand NamesDitropan®; Ditropan® XL; Gelnique™; Oxytrol®
Canadian Brand NamesApo-Oxybutynin®; Ditropan®; Ditropan® XL; Gen-Oxybutynin; Novo-Oxybutynin; Nu-Oxybutyn; Oxytrol®; PMS-Oxybutynin; Riva-Oxybutynin; Uromax®
Pharmacologic CategoryAntispasmodic Agent, Urinary
Use: Labeled IndicationsAntispasmodic for neurogenic bladder (urgency, frequency, urge incontinence)
Dosing: Adults

Bladder spasms:

Oral:

Regular release: 5 mg 2-3 times/day up to maximum of 5 mg 4 times/day

Extended release: Initial: 5-10 mg once daily, adjust dose in 5 mg increments at weekly intervals; maximum: 30 mg daily

Transdermal: Apply one 3.9 mg/day patch twice weekly (every 3-4 days)

Note: Should be discontinued periodically to determine whether the patient can manage without the drug and to minimize resistance to the drug.

Dosing: Elderly

Oral: Regular release: Initial dose: 2.5 mg 2-3 times/day; increase as needed to 5 mg 2-3 times/day

Transdermal: Refer to adult dosing. **Note:** Should be discontinued periodically to determine whether the patient can manage without the drug and to minimize resistance to the drug.

Dosing: Pediatric

Bladder spasms: Oral: Children:

1-5 years (unlabeled use): 0.2 mg/kg/dose 2-4 times/day

>5 years: 5 mg twice daily, up to 5 mg 3 times/day maximum

>6 years: Extended release: 5 mg once daily; adjust dose in 5 mg increments; maximum dose: 20 mg/day

Administration: OralImmediate release tablets and solution should be administered on an empty stomach with water. Extended release tablets may be taken with or without food and must be swallowed whole; do not crush, divide, or chew.
Administration: OtherTransdermal: Apply to clean, dry skin on abdomen, hip, or buttock. Select a new site for each new system (avoid reapplication to same site within 7 days).
Dietary ConsiderationsFood causes a slight delay in the absorption of the oral solution and bioavailability is increased by ~25%. Absorption of the extended release tablet is not affected by food.
StorageStore at controlled room temperature. Protect syrup from light. Keep transdermal patch in sealed pouch.
ContraindicationsHypersensitivity to oxybutynin or any component of the formulation; untreated glaucoma; urinary retention; gastric retention or conditions with severely decreased GI motility
Warnings/Precautions

Concerns related to adverse effects:

- Anticholinergic effects: May cause anticholinergic effects (eg, agitation, confusion, hallucinations, somnolence) which may require dose reduction or discontinuation of therapy.
- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Heat prostration: May increase the risk of heat prostration.

Disease-related concerns:

- Autonomic neuropathy: Use with caution in patients with autonomic neuropathy; may exacerbate condition.
- Cardiovascular disease: Use with caution in patients with CAD, heart failure, hypertension, and/or cardiac arrhythmias; may exacerbate condition.
- Dementia: Use with caution in patients with dementia; may aggravate symptoms of disease.
- Gastrointestinal disorders: Use with caution in patients with ulcerative colitis, intestinal atony, gastroesophageal reflux or with medications that may exacerbate esophagitis (eg, bisphosphonates). May decrease GI motility; in patients with ulcerative colitis, use may increase risk of paralytic ileus or toxic megacolon.
- Glaucoma: Use with caution in patients with treated angle-closure glaucoma; may exacerbate condition; use is contraindicated with untreated glaucoma.
- Hepatic impairment: Use with caution in patients with hepatic impairment; due to limited experience.
- Hiatal hernia: Use with caution in patients with hiatal hernia.
- Hyperthyroidism: Use with caution in patients with hyperthyroidism; may exacerbate condition.
- Myasthenia gravis: Use with caution in patients with myasthenia gravis; may exacerbate condition.
- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture; may cause urinary retention.
- Renal impairment: Use with caution in patients with renal impairment; due to limited experience. Use caution with bladder outflow obstruction; may increase risk of urinary retention.

Special populations:

- Elderly: Use with caution in the elderly due to anticholinergic activity (eg, confusion, constipation, blurred vision, and tachycardia).

Dosage form specific issues:

- Extended release formulation: The extended release formulation consists of drug within a nondeformable matrix; following drug release/absorption, the matrix/shell is expelled in the stool. The use of nondeformable products in patients with known stricture/narrowing of the GI tract has been associated with symptoms of obstruction.
- Transdermal patch: May contain conducting metal (eg, aluminum); remove patch prior to MRI.

Geriatric ConsiderationsCaution should be used in the elderly due to anticholinergic activity (eg, confusion, constipation, blurred vision, and tachycardia). Start with lower doses. Transdermal dosage form may have less potential for these effects. Oxybutynin may cause memory problems in the elderly. A study of 12 healthy volunteers with an average age of 69 showed cognitive decline while taking the drug (*J Am Geriatr Soc*, 1998, L46:8-13). Studies using transdermal dosage form did not reveal any differences in safety or efficacy between elderly and younger adults.
Pregnancy Risk FactorB
Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women; use during pregnancy only if clearly needed.
LactationExcretion in breast milk unknown/use caution
Breast-Feeding ConsiderationsSuppression of lactation has been reported.
Adverse Reactions

Oral:

>10%:

Central nervous system: Dizziness (4% to 17%), somnolence (2% to 14%)

Gastrointestinal: Xerostomia (29% to 71%; dose related), constipation (7% to 15%), nausea (2% to 12%)

5% to 10%:

Central nervous system: Headache (6% to 10%), pain (4% to 7%), nervousness (1% to 7%), insomnia (1% to 6%)

Gastrointestinal: Diarrhea (7% to 9%), dyspepsia (6% to 7%)

Genitourinary: Urinary hesitation (9%), urinary tract infection (5% to 7%), urinary retention (6%)

Neuromuscular & skeletal: Weakness (3% to 7%)

Ocular: Blurred vision (1% to 10%), dry eyes (3% to 6%)

Respiratory: Rhinitis (2% to 6%)

1% to <5%: Abdominal pain, aptyalism, arrhythmia, arthralgia, asthma, back pain, bronchitis, confusion, convulsion, cough, cystitis, depression, dry skin, dry throat, dysgeusia, dysphagia, dysuria, edema, eructation, extremity pain, eye irritation, fatigue, flank pain, flatulence, fluid retention, flushing, fungal infection, gastrointestinal reflux disease, hoarseness, hyperglycemia, hyper-/hypotension, keratoconjunctivitis sicca, loose stools, nasal congestion, nasal dryness, nasopharyngitis, pain, palpitation, pharyngolaryngeal pain, pollakiuria, pruritus, sinus congestion, sinus headache, thirst, tongue coated, upper respiratory tract infection, vomiting

Postmarketing and/or case reports: Agitation, convulsion, cycloplegia, GI motility decreased, hallucination, impotence, mydriasis, psychotic disorder, rash, sweating decreased, tachycardia

Transdermal:

>10%: Local: Application site reaction (17%), pruritus (14%)

1% to 10%:

Gastrointestinal: Xerostomia (4% to 10%), diarrhea (3%), constipation (3%)

Genitourinary: Dysuria (2%)

Local: Erythema (6% to 8%), vesicles (3%), rash (3%)

Ocular: Vision changes (3%)

Postmarketing and/or case reports: Cardiac arrhythmia, cycloplegia, hallucinations, lactation suppressed, myocarditis, impotence, seizure, sweating decreased, tachycardia

Metabolism/Transport Effects **Substrate** of CYP3A4 (minor); **Inhibits** CYP2C8 (weak), 2D6 (weak), 3A4 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Cannabinoids: Anticholinergic Agents may enhance the tachycardic effect of Cannabinoids. *Risk C: Monitor therapy*

Potassium Chloride: Anticholinergic Agents may enhance the ulcerogenic effect of Potassium Chloride. *Risk D: Consider therapy modification*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Secretin: Anticholinergic Agents may diminish the stimulatory effect of Secretin. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions Ethanol: Use ethanol with caution (may increase CNS depression and toxicity). Watch for sedation.

Test Interactions May suppress the wheal and flare reactions to skin test antigens.

Monitoring Parameters Incontinence episodes, postvoid residual (PVR)

Nursing: Physical Assessment/Monitoring Assess other prescriptions, OTC medications, or herbal products patient may be taking for interactions. Assess voiding pattern, incontinent episodes, frequency, urgency, distention, and urinary retention prior to beginning therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, possible side effects, and symptoms to report.

Patient Education Take prescribed oral dose preferably on an empty stomach, 1 hour before or 2 hours after meals. Swallow extended-release tablets whole; do not chew or crush. You may experience dizziness, lightheadedness, or drowsiness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); dry mouth or changes in appetite (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); constipation (increased exercise, fluids, fruit, fiber, or stool softener may help); decreased sexual ability (reversible with discontinuance of drug); or decreased sweating (use caution in hot weather, avoid extreme exercise or activity). Use alcohol with caution; may increase drowsiness. Report rapid heartbeat, palpitations, or chest pain; difficulty voiding; or vision changes. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Product Availability

Gelnique™: FDA approved January 2009; anticipated availability in second quarter 2009

Gelnique™ is a topical gel for the treatment of overactive bladder.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Syrup, as chloride: 5 mg/5 mL (473 mL)

Ditropan®: 5 mg/5 mL (473 mL)

Tablet, as chloride: 5 mg

Ditropan®: 5 mg

Tablet, extended release, as chloride: 5 mg, 10 mg, 15 mg

Ditropan® XL: 5 mg, 10 mg, 15 mg

Transdermal system:

Oxytrol®: 3.9 mg/day (8s) [39 cm^2; total oxybutynin 36 mg]

Generic Available Yes: Excludes transdermal patch

Pricing: U.S. (www.drugstore.com)

Patch, twice-weekly (Oxytrol)

3.9 mg/24 hrs (8): $123.01

Syrup (Ditropan)

5 mg/5 mL (300): $70.98

Syrup (Oxybutynin Chloride)

5 mg/5 mL (120): $24.99

Tablet, 24-hour (Ditropan XL)

5 mg (30): $112.23

10 mg (30): $109.99

15 mg (30): $115.84

Tablet, 24-hour (Oxybutynin Chloride)

5 mg (100): $289.98

10 mg (100): $292.00

15 mg (100): $299.99

Tablets (Ditropan)

5 mg (60): $62.99

Tablets (Oxybutynin Chloride)

5 mg (60): $13.45

Mechanism of ActionDirect antispasmodic effect on smooth muscle, also inhibits the action of acetylcholine on smooth muscle (exhibits $^1/_5$ the anticholinergic activity of atropine, but is 4-10 times the antispasmodic activity); does not block effects at skeletal muscle or at autonomic ganglia; increases bladder capacity, decreases uninhibited contractions, and delays desire to void, therefore, decreases urgency and frequency

Pharmacodynamics/Kinetics

Onset of action: Oral: 30-60 minutes

Peak effect: 3-6 hours

Duration: 6-10 hours (up to 24 hours for extended release oral formulation)

Absorption: Oral: Rapid and well absorbed; Transdermal: High

Distribution: I.V.: V_d: 193 L

Metabolism: Hepatic via CYP3A4; Oral: High first-pass metabolism (not with I.V. or transdermal use); forms active and inactive metabolites

Bioavailability: Oral: ~6%

Half-life elimination: I.V.: ~2 hours (parent drug), 7-8 hours (metabolites)

Time to peak, serum: Oral: ~60 minutes; Transdermal: 24-48 hours

Excretion: Urine, as metabolites and unchanged drug (<0.1%)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation), and taste perversion.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common; may cause insomnia or dizziness

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive sedation and anticholinergic side effects (dry mouth)

Medication Safety Issues

Sound-alike/look-alike issues:

Endocet® may be confused with Indocid®

Percocet® may be confused with Fioricet®, Percodan®

Roxicet™ may be confused with Roxanol™

Tylox® may be confused with Trimox®, Tylenol®, Wymox®, Xanax®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Duplicate therapy issues: This product contains acetaminophen, which may be a component of other combination products. Do not exceed the maximum recommended daily dose of acetaminophen.

Pronunciation(oks i KOE done & a seet a MIN oh fen)

U.S. Brand NamesEndocet®; Magnacet™; Percocet®; Primalev™; Roxicet™; Roxicet™ 5/500; Tylox®

Canadian Brand NamesEndocet®; Oxycocet®; Percocet®; Percocet®-Demi; PMS-Oxycodone-Acetaminophen

Pharmacologic CategoryAnalgesic, Opioid

Use: Labeled IndicationsManagement of moderate-to-severe pain

Use: DentalTreatment of postoperative pain

Dosing: Adults

Note: Initial dose is based on the **oxycodone** content; however, the maximum daily dose is based on the **acetaminophen** content.

Management of pain: Doses should be given every 4-6 hours as needed and titrated to appropriate analgesic effects.

Maximum daily dose, based on acetaminophen content: Oral: 4 g/day.

Mild-to-moderate pain: Oral: Initial dose, **based on oxycodone content:** 2.5-5 mg

Severe pain: Oral: Initial dose, **based on oxycodone content:** 10-30 mg

Dosing: ElderlyDoses should be titrated to appropriate analgesic effects: Oral: Initial dose, **based on oxycodone content:** 2.5-5 mg every 6 hours. Do not exceed 4 g/day of acetaminophen.

Dosing: Pediatric

Note: Initial dose is based on the **oxycodone** content; however, the maximum daily dose is based on the **acetaminophen** content.

Management of pain: Doses should be given every 4-6 hours as needed and titrated to appropriate analgesic effects.

Mild-to-moderate pain: Oral: Initial dose, **based on oxycodone content:** 0.05-0.1 mg/kg/dose

Severe pain: Oral: Initial dose, **based on oxycodone content:** 0.3 mg/kg/dose

Maximum dose, based on acetaminophen content: Oral: Children <45 kg: 90 mg/kg/day; children >45 kg: 4 g/day

Dosing: Hepatic ImpairmentDose should be reduced in patients with severe liver disease.

StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F). Protect from moisture.

RestrictionsC-II

ContraindicationsHypersensitivity to oxycodone, acetaminophen, or any component of the formulation; severe respiratory depression (in absence of resuscitative equipment or ventilatory support); pregnancy (prolonged periods or high doses at term)

Allergy Considerations

- Acetaminophen Allergy/Hypersensitivity
- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Hepatotoxicity: May cause severe hepatic toxicity on acute overdose; in addition, chronic daily dosing in adults has resulted in liver damage in some patients.

- Hypotension: May cause hypotension; use with caution in patients with hypovolemia, cardiovascular disease (including acute MI), or drugs which may exaggerate hypotensive effects (including phenothiazines or general anesthetics).

- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene derivative opioid agonists (codeine, hydrocodone, hydromorphone, levorphanol, oxymorphone).

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.

- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.

- Biliary tract impairment: Use hydrocodone with caution in patients with biliary tract dysfunction; acute pancreatitis may cause constriction of sphincter of Oddi.

- CNS depression/coma: Use with caution in patients with CNS depression or coma.

- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.

- Ethanol use: Use with caution in patients with alcoholic liver disease; consuming ≥3 alcoholic drinks/day may increase the risk of liver damage.

- G6PD deficiency: Use with caution in patients with known G6PD deficiency.

- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.

- Hepatic impairment: Use with caution in patients with severe hepatic impairment.

- Obesity: Use with caution in patients who are morbidly obese.

- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.

- Psychosis: Use with caution in patients with toxic psychosis.

- Renal impairment: Use with caution in patients with severe renal impairment.

- Respiratory disease: Use hydrocodone with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages.

- Seizures: Use with caution in patients with a history of seizure disorders.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.

Dosage form specific issues:

- Sulfites: Some preparations contain sulfites which may cause allergic reactions.

Other warnings/precautions:

- Dosage limit: Limit acetaminophen dose to <4 g/day.

- Withdrawal: Concurrent use of agonist/antagonist analgesics may precipitate withdrawal symptoms and/or reduced analgesic efficacy in patients following prolonged therapy with mu opioid agonists. Abrupt discontinuation following prolonged use may also lead to withdrawal symptoms.

Geriatric ConsiderationsEnhanced analgesia has been seen in elderly patients on therapeutic doses of narcotics; duration of action may be increased in the elderly. Elderly may be particularly susceptible to the CNS depressant and constipating effects of narcotics. If 1 tablet/dose is used, it may be useful to add an additional 325 mg of acetaminophen to maximize analgesic effect.

Pregnancy Risk FactorC/D (prolonged periods or high doses at term)

Pregnancy ConsiderationsUse of narcotics during pregnancy may produce physical dependence in the neonate; respiratory depression may occur in the newborn if narcotics are used prior to delivery (especially high doses).

LactationEnters breast milk/use caution

Breast-Feeding Considerations

Oxycodone: Excreted in breast milk. If occasional doses are used during breast-feeding, monitor infant for sedation, GI effects, and changes in feeding pattern.

Acetaminophen: May be taken while breast-feeding.

Adverse ReactionsFrequency not defined (also see individual agents): Allergic reaction, constipation, dizziness, dysphoria, euphoria, lightheadedness, nausea, pruritus, respiratory depression, sedation, skin rash, vomiting
Metabolism/Transport Effects

Oxycodone: **Substrate** (minor) of CYP2D6, 3A

Acetaminophen: **Substrate** (minor) of CYP1A2, 2A6, 2C9, 2D6, 2E1, 3A4

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Cholestyramine Resin: May decrease the absorption of Acetaminophen. Effect is minimal if cholestyramine is administered 1 hour after acetaminophen. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Imatinib: May increase the serum concentration of Acetaminophen. *Risk D: Consider therapy modification*

Isoniazid: May enhance the adverse/toxic effect of Acetaminophen. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Acetaminophen may enhance the anticoagulant effect of Vitamin K Antagonists. Most likely with daily acetaminophen doses >1.3 g for >1 week. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: May have additive CNS depression. In addition, excessive intake of ethanol may increase the risk of acetaminophen-induced hepatotoxicity. Avoid ethanol or limit to <3 drinks/day.
Monitoring ParametersMonitor for pain relief, respiratory and mental status, blood pressure, constipation
Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.

Mechanism of Action

Oxycodone, as with other narcotic (opiate) analgesics, blocks pain perception in the cerebral cortex by binding to specific receptor molecules (opiate receptors) within the neuronal membranes of synapses. This binding results in a decreased synaptic chemical transmission throughout the CNS thus inhibiting the flow of pain sensations into the higher centers. Mu and kappa are the two subtypes of the opiate receptor to which oxycodone binds to cause analgesia.

Acetaminophen inhibits the synthesis of prostaglandins in the CNS and peripherally blocks pain impulse generation; produces antipyresis from inhibition of hypothalamic heat-regulating center.

Pharmacodynamics/KineticsSee individual agents.

- Acetaminophen
- Narcotic / Opioid Analgesics
- OxyCODONE

Dental Health Professional ConsiderationsOxycodone, as with other narcotic analgesics, is recommended only for limited acute dosing (ie, 3 days or less). Oxycodone has an addictive liability, especially when given long-term. The acetaminophen component requires use with caution in patients with alcoholic liver disease.

Acetaminophen: A study by Hylek, et al, suggested that the combination of acetaminophen with warfarin (Coumadin®) may cause enhanced anticoagulation. The following recommendations have been made by Hylek, et al, and supported by an editorial in *JAMA* by Bell.

Dose and duration of acetaminophen should be as low as possible, individualized and monitored.

For patients who reported taking the equivalent of at least 4 regular strength (325 mg) tablets for longer than a week, the odds of having an INR >6.0 were increased 10-fold above those not taking acetaminophen. Risk decreased with lower intakes of acetaminophen reaching a background level of risk at a dose of 6 or fewer 325 mg tablets per week.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Nausea, sedation, constipation, and xerostomia (normal salivary flow resumes upon discontinuation). See Dental Comment.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness and fatigue are common. May cause restlessness, nervousness, or confusion; may rarely cause hallucinations, depression, or paradoxical CNS stimulation.

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may cause additive sedation; use lower doses of both agents. Oxycodone may cause severe hypotension after concurrent administration with drugs which compromise vasomotor tone (eg, phenothiazines); monitor blood pressure.

Cardiovascular ConsiderationsOxycodone may cause constipation which may be problematic in patients with unstable angina, and patients after myocardial infarction. The hemodynamic responses to valsalva-like maneuvers due to straining may have adverse cardiovascular consequences in patients with critical coronary artery disease.

Index TermsAcetaminophen and Oxycodone

Medication Safety Issues

Sound-alike/look-alike issues:

Percodan® may be confused with Decadron®, Percocet®, Percogesic®, Periactin®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(oks i KOE done & AS pir in)

U.S. Brand NamesEndodan®; Percodan®

Canadian Brand NamesEndodan®; Oxycodan®; Percodan®

Pharmacologic CategoryAnalgesic, Opioid

Use: Labeled IndicationsManagement of moderate-to-severe pain

Use: DentalTreatment of postoperative pain

Dosing: Adults**Analgesic:** Oral (based on oxycodone combined salts): Percodan®: 1 tablet every 6 hours as needed for pain; maximum aspirin dose should not exceed 4 g/day.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Analgesic:** Oral (based on oxycodone combined salts): Maximum oxycodone: 5 mg/dose; maximum aspirin dose should not exceed 4 g/day. Doses should be given every 6 hours as needed.

Mild-to-moderate pain: Initial dose, **based on oxycodone content:** 0.05-0.1 mg/kg/dose

Severe pain: Initial dose, **based on oxycodone content:** 0.3 mg/kg/dose

Dosing: Hepatic ImpairmentDose should be reduced in patients with severe liver disease.

Dietary ConsiderationsMay be taken with food or water.

RestrictionsC-II

ContraindicationsHypersensitivity to oxycodone, salicylates, other NSAIDs, or any component of the formulation; patients with the syndrome of asthma, rhinitis, and nasal polyps; inherited or acquired bleeding disorders (including factor VII and factor IX deficiency); do not use in children (<16 years of age) in the presence of viral infections (chickenpox or flu symptoms), with or without fever, due to a potential association with Reye's syndrome; significant respiratory depression; hypercarbia; known or suspected paralytic ileus; acute or severe bronchial asthma; pregnancy (3rd trimester)

Allergy Considerations

- Opioid Allergy/Hypersensitivity
- Salicylate Allergy/Sensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hypotension: May cause hypotension; use with caution in patients with hypovolemia, cardiovascular disease (including acute MI), or drugs which may exaggerate hypotensive effects (including phenothiazines or general anesthetics).
- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene derivative opioid agonists (codeine, hydrocodone, hydromorphone, levorphanol, oxymorphone).
- Salicylate sensitivity: Patients with sensitivity to tartrazine dyes, nasal polyps, and asthma may have an increased risk of salicylate sensitivity.
- Tinnitus: Discontinue use if tinnitus or impaired hearing occurs.

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.
- Biliary tract impairment: Use with caution in patients with biliary tract dysfunction; acute pancreatitis may cause constriction of sphincter of Oddi.
- Bleeding disorders: Use with caution in patients with platelet and bleeding disorders.

- CNS depression/coma: Use with caution in patients with CNS depression or coma.

- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.

- Ethanol use: Heavy ethanol use (>3 drinks/day) can increase bleeding risks.

- Gastrointestinal disease: Use with caution in patients with erosive gastritis or peptic ulcer disease.

- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.

- Hepatic impairment: Use with caution in patients with severe hepatic impairment.

- Obesity: Use with caution in patients who are morbidly obese.

- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.

- Psychosis: Use with caution in patients with toxic psychosis.

- Renal impairment: Use with caution in patients with severe renal impairment.

- Respiratory disease: Use hydrocodone with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages.

- Seizures: Use with caution in patients with a history of seizure disorders.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.

- Surgical patients: ASA should be avoided (if possible) in surgical patients for 1-2 weeks prior to surgery, to reduce the risk of excessive bleeding (except in patients with cardiac stents that have not completed their full course of dual antiplatelet therapy [aspirin, clopidogrel]; patient specific situations need to be discussed with cardiologist; AHA/ACC/SCAI/ACS/ADA Science Advisory provides recommendations).

Other warnings/precautions:

- Withdrawal: Concurrent use of agonist/antagonist analgesics may precipitate withdrawal symptoms and/or reduced analgesic efficacy in patients following prolonged therapy with mu opioid agonists. Abrupt discontinuation following prolonged use may also lead to withdrawal symptoms.

Geriatric ConsiderationsEnhanced analgesia has been seen in the elderly patients on therapeutic doses of narcotics; duration of action may be increased. Elderly may be particularly susceptible to the CNS depressant and constipating effects of narcotics. If 1 tablet/dose is used, it may be useful to add an additional 325 mg of aspirin to maximize analgesic effect.

Pregnancy Risk FactorD

Pregnancy ConsiderationsSee individual agents.

LactationEnters breast milk/use caution

Breast-Feeding Considerations

Aspirin: Caution is suggested due to potential adverse effects in nursing infants.

Oxycodone: No data reported.

Adverse Reactions**Note:** Also refer to individual agents

Common (frequency not defined):

Central nervous system: Dizziness, drowsiness, lightheadedness, sedation

Dermatologic: Pruritus

Gastrointestinal: Nausea, vomiting, constipation

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Allergic reaction, anaphylaxis, anaphylactoid reaction, angioedema, apnea, asthma, bradycardia, bronchospasm, circulatory depression, confusion, duodenal ulcer, dysphoria, dyspnea, ecchymosis, euphoria, gastric ulcer, gastrointestinal bleeding, hallucination, hemorrhage, hepatitis, hepatotoxicity, hypotension, hypoglycemia, hyperglycemia, ileus, interstitial nephritis, intestinal obstruction, laryngeal edema, metabolic acidosis, pancreatitis, papillary necrosis, paresthesia, purpura, pulmonary edema, proteinuria, rash, renal failure, respiratory alkalosis, respiratory depression, Reye syndrome, rhabdomyolysis, seizure, shock, thrombocytopenia, tinnitus

Metabolism/Transport Effects

Oxycodone: **Substrate** (minor) of CYP2D6, 3A

Aspirin: **Substrate** of CYP2C9 (minor)

Drug Interactions

ACE Inhibitors: Salicylates may diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alendronate: Aspirin may enhance the adverse/toxic effect of Alendronate. Specifically gastrointestinal adverse events. *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Anticoagulants: Salicylates may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the anticoagulant effect of Salicylates. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: Salicylates may enhance the adverse/toxic effect of Carbonic Anhydrase Inhibitors. Salicylate toxicity might be enhanced by this same combination. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Corticosteroids (Systemic): Salicylates may enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Drotrecogin Alfa: Salicylates may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Ginkgo Biloba: May enhance the antiplatelet effect of Salicylates. *Risk D: Consider therapy modification*

Heparin: Aspirin may enhance the anticoagulant effect of Heparin. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Aspirin. *Risk X: Avoid combination*

Methotrexate: Salicylates may increase the serum concentration of Methotrexate. Salicylate doses used for prophylaxis of cardiovascular events are not likely to be of concern. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

NSAID (Nonselective): May enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Diclofenac. *Risk D: Consider therapy modification*

Omega-3-Acid Ethyl Esters: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Salicylates: May enhance the anticoagulant effect of other Salicylates. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Sulfonylureas: Salicylates may enhance the hypoglycemic effect of Sulfonylureas. Of concern with regular, higher doses of salicylates, not sporadic, low doses. *Risk C: Monitor therapy*

Thrombolytic Agents: Salicylates may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Tiludronate: Aspirin may decrease the serum concentration of Tiludronate. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk C: Monitor therapy*

Uricosuric Agents: Salicylates may diminish the therapeutic effect of Uricosuric Agents. Specifically, uricosuria. *Risk C: Monitor therapy*

Valproic Acid: Salicylates may increase the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Varicella Virus-Containing Vaccines: Salicylates may enhance the adverse/toxic effect of Varicella Virus-Containing Vaccines. Reye's Syndrome may develop. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Salicylates may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Test InteractionsMay cross-react with urine tests for cocaine or marijuana.

Tablets (Percodan)

4.5-0.38-325 mg (20): $35.99

Mechanism of Action

Oxycodone, as with other narcotic (opiate) analgesics, blocks pain perception in the cerebral cortex by binding to specific receptor molecules (opiate receptors) within the neuronal membranes of synapses. This binding results in a decreased synaptic chemical transmission throughout the CNS, thus inhibiting the flow of pain sensations into the higher centers. Mu and kappa are the two subtypes of the opiate receptor to which oxycodone binds to cause analgesia.

Aspirin inhibits prostaglandin synthesis by decreasing the activity of the enzyme, cyclooxygenase, which results in decreased formation of prostaglandin precursors, acts on the hypothalamic heat-regulating center to reduce fever, blocks thromboxane synthetase action which prevents formation of the platelet-aggregating substance thromboxane A_2

- Narcotic / Opioid Analgesics
- OxyCODONE

Dental Health Professional ConsiderationsOxycodone, as with other narcotic analgesics, is recommended only for limited acute dosing (ie, 3 days or less). Oxycodone has an addictive liability, especially when given long-term. The oxycodone with aspirin could have anticoagulant effects and could possibly affect bleeding times.

There is no scientific evidence to warrant discontinuance of aspirin prior to dental surgery. Patients taking one aspirin tablet daily as an antithrombotic and who require dental surgery should be given special consideration in consultation with the physician before removal of the aspirin relative to prevention of postoperative bleeding.

The Food and Drug Administration (FDA), has issued a letter updating information and considerations regarding the use of ibuprofen (400 mg doses) in patients who are taking low dose aspirin (81 mg, immediate release; not enteric coated) for cardioprotection and stroke prevention. Ibuprofen, at these doses, may interfere with aspirin's antiplatelet effect depending upon when it is administered. Patients initiated on aspirin first (for ~1 week) then ibuprofen (400 mg 3 times/day for 10 days) seem to maintain aspirin's platelet effect (Cryer B, 2005). Ibuprofen has the greatest impact on aspirin if administered less than 8 hours before aspirin (Catella-Lawson F, 2001).

Patients may require counseling about the appropriate timing of ibuprofen dosing in relationship to aspirin therapy. With occasional use of ibuprofen, a clinically-significant interaction with aspirin in unlikely. To avoid interference during chronic dosing, a single dose of ibuprofen should be taken 30-120 minutes after aspirin ingestion or at least 8 hours should elapse after ibuprofen dosing before giving aspirin (FDA, 2006; Catella-Lawson F, 2001).

The clinical implications of the interaction are unclear. There have not been any clinical endpoint studies conducted at this time. Avoidance of this interaction is potentially important because aspirin's vascular protection could be decreased or negated.

Other nonselective NSAIDs may have potential for a similar interaction with aspirin. Such has been described with naproxen (Capone ML, 2005). Acetaminophen does not appear to interfere with the antiplatelet effect of aspirin. Other clinical scenarios (use of smaller ibuprofen doses, other aspirin products, other doses of aspirin) have not been evaluated.

Additional information is available at: http://www.fda.gov/cder/drug/infopage/aspirin/default.htm

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Nausea, sedation, constipation, and xerostomia (normal salivary flow resumes upon discontinuation). May have anticoagulant effects which may affect bleeding time. The elderly are a high-risk population for adverse effects from NSAIDs. As many as 60% of elderly patients with GI complications from NSAIDs can develop peptic ulceration and/or hemorrhage asymptomatically. Concomitant disease and drug use contribute to the risk of GI adverse effects. Enhanced analgesia has been seen with therapeutic doses of narcotics; duration of action may be increased. Elderly may also be particularly susceptible to the CNS depressant effects of narcotics. See Dental Comment.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness and fatigue are common. May cause agitation, anxiety, lethargy, mental impairment, restlessness, nervousness, or confusion; may rarely cause hallucinations, depression, or paradoxical CNS stimulation.

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may cause additive sedation; use lower doses of both agents. Oxycodone may cause severe hypotension after concurrent administration with drugs which compromise vasomotor tone (eg, phenothiazines); monitor blood pressure. May cause GI side effects which may be further exacerbated with concurrent SSRI, lithium, or valproic acid use; monitor. May cause platelet abnormalities which may be further exacerbated with concurrent SSRI use; monitor. Salicylate can displace phenytoin and valproic acid leading to a decrease in phenytoin and an increase in valproic acid levels; monitor.

Index TermsAspirin and Oxycodone

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(oks i KOE done & eye byoo PROE fen)

U.S. Brand NamesCombunox™

Pharmacologic CategoryAnalgesic, Opioid; Nonsteroidal Anti-inflammatory Drug (NSAID), Oral

Use: Labeled IndicationsShort-term (≤7 days) management of acute, moderate-to-severe pain

Use: DentalShort-term (≤3-5 days) management of acute, moderate-to-severe pain

Dosing: Adults**Pain:** Oral: Take 1 tablet every 6 hours as needed (maximum: 4 tablets/24 hours); do not take for longer than 7 days

Dosing: ElderlyRefer to adult dosing.

Dietary ConsiderationsTake with or without food.

StorageStore between 15°C to 30°C (59°F to 86°F).

RestrictionsC-II

A medication guide should be dispensed with each prescription for oral administration. A template for the required MedGuide can be found on the FDA website at http://www.fda.gov/cder/drug/infopage/COX2/NSAIDmedguide.htm

ContraindicationsHypersensitivity to oxycodone, ibuprofen, aspirin, other NSAIDs, or any component of the formulation; patients with suspected paralytic ileus; perioperative pain in the setting of coronary artery bypass graft (CABG) surgery; significant respiratory depression, hypercarbia, acute/severe bronchial asthma

Allergy Considerations

- Nonsteroidal Anti-inflammatory Drug (NSAID) Allergy
- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Cardiovascular events: See "Concerns related to adverse effects" below.
- Coronary artery bypass graft surgery: See "Disease-related concerns" below.
- Gastrointestinal events: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Anaphylactoid reactions: Even in patients without prior exposure anaphylactoid reactions may occur; patients with "aspirin triad" (bronchial asthma, aspirin intolerance, rhinitis) may be at increased risk. Do not use in patients who experience bronchospasm, asthma, rhinitis, or urticaria with NSAID or aspirin therapy.
- Aseptic meningitis: May increase the risk of aseptic meningitis, especially in patients with systemic lupus erythematosus (SLE) and mixed connective tissue disorders.
- Bleeding/hemostasis: Platelet adhesion and aggregation may be decreased; may prolong bleeding time; patients with coagulation disorders or who are receiving anticoagulants should be monitored closely. Anemia may occur; patients on long-term NSAID therapy should be monitored for anemia.
- Cardiovascular events: **[U.S. Boxed Warning]: NSAIDs are associated with an increased risk of adverse cardiovascular thrombotic events, including MI, stroke, and new onset or worsening of pre-existing hypertension.** Risk may be increased with duration of use or pre-existing cardiovascular risk factors or disease. Carefully evaluate individual cardiovascular risk profiles prior to prescribing. Use caution with fluid retention, heart failure, or hypertension. Concurrent administration of ibuprofen, and potentially other nonselective NSAIDs, may interfere with aspirin's cardioprotective effect. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of cardiovascular events; alternate therapies should be considered for patients at high risk.
- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Gastrointestinal events: **[U.S. Boxed Warning]: NSAIDs may increase risk of gastrointestinal irritation, inflammation, ulceration, bleeding, and perforation.** These events may occur at any time during therapy and without warning. Use caution with a history of GI disease (bleeding or ulcers), concurrent therapy with aspirin, anticoagulants and/or corticosteroids, smoking, use of alcohol, the elderly or debilitated patients. Use the lowest effective dose for the shortest duration of time, consistent with individual patient goals, to reduce risk of GI adverse events; alternate therapies should be considered for patients at high risk.

- Hypotension: May cause hypotension; use with caution in patients with hypovolemia, cardiovascular disease (including acute MI), or drugs which may exaggerate hypotensive effects (including phenothiazines or general anesthetics).
- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene derivative opioid agonists (codeine, hydrocodone, hydromorphone, levorphanol, oxymorphone).
- Skin reactions: NSAIDs may cause serious skin adverse events including exfoliative dermatitis, Stevens-Johnson syndrome (SJS), and toxic epidermal necrolysis (TEN); discontinue use at first sign of skin rash or hypersensitivity.

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.
- Asthma: Do not administer NSAIDs to patients with aspirin-sensitive asthma; severe bronchospasm may occur. Use with caution in patients with other forms of asthma.
- Biliary tract impairment: Use with caution in patients with biliary tract dysfunction; acute pancreatitis may cause constriction of sphincter of Oddi.
- CNS depression/coma: Use with caution in patients with CNS depression or coma.
- Coronary artery bypass graft surgery: **[U.S. Boxed Warning]: Use is contraindicated for treatment of perioperative pain in the setting of coronary artery bypass graft (CABG) surgery.** Risk of MI and stroke may be increased with use following CABG surgery.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure (ICP); exaggerated elevation of ICP may occur.
- Hepatic impairment: Use with caution in patients with severe hepatic impairment. Severe hepatic reactions (eg, fulminant hepatitis, liver failure) have occurred with NSAID use, rarely; discontinue if signs or symptoms of liver disease develop, or if systemic manifestations occur.
- Obesity: Use with caution in patients who are morbidly obese.
- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.
- Psychosis: Use with caution in patients with toxic psychosis.
- Renal impairment: NSAID use may compromise existing renal function; dose-dependent decreases in prostaglandin synthesis may result from NSAID use, reducing renal blood flow which may cause renal decompensation. Patients with impaired renal function, dehydration, heart failure, liver dysfunction, those taking diuretics, and ACE inhibitors, and the elderly are at greater risk of renal toxicity. Rehydrate patient before starting therapy; monitor renal function closely. Not recommended for use in patients with advanced renal disease. Long-term NSAID use may result in renal papillary necrosis.
- Respiratory disease: Use hydrocodone with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages. Opioids may suppress cough reflex; use with caution during postoperative period and in patients with pulmonary disease.
- Seizures: Use with caution in patients with a history of seizure disorders.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.
- Elderly: The elderly are at increased risk for adverse effects (especially peptic ulceration, CNS effects, renal toxicity) even at low doses.
- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Surgical/dental procedures: Withhold for at least 4-6 half-lives prior to surgical or dental procedures.
- Withdrawal: Concurrent use of agonist/antagonist analgesics may precipitate withdrawal symptoms and/or reduced analgesic efficacy in patients following prolonged therapy with mu opioid agonists. Abrupt discontinuation following prolonged use may also lead to withdrawal symptoms.

Geriatric ConsiderationsThe elderly are at increased risk for adverse effects from NSAIDs. As many as 60% of elderly can develop peptic ulceration and/or hemorrhage asymptomatically. CNS adverse effects, such as confusion, agitation, and hallucination, are generally seen in overdose or high-dose situations; however, elderly patients may demonstrate these adverse effects at lower doses than younger adults. The elderly are also at increased risk of renal toxicity.

Pregnancy Risk FactorC/D (3rd trimester)

Pregnancy Considerations As with other NSAID-containing products, this agent should be avoided in late pregnancy because it may cause premature closure of the ductus arteriosus.

Lactation Enters breast milk/contraindicated

Breast-Feeding Considerations Ibuprofen is not transferred to milk in significant quantities and is considered compatible with breast-feeding by AAP. Oxycodone, however, is excreted in breast milk and withdrawal may occur in breast-fed infants when maternal opioid administration is discontinued. Discontinuation of either the opioid-containing medication (Combunox™) or breast-feeding is recommended.

Adverse Reactions

>10%:

Central nervous system: Dizziness (5% to 19%), somnolence (7% to 17%)

Gastrointestinal: Nausea (9% to 25%)

2% to 10%:

Cardiovascular: Vasodilation (<1% to 3%)

Central nervous system: Headache (10%), fever (3%)

Gastrointestinal: Constipation (<1% to 5%), vomiting (5%), diarrhea (2%), dyspepsia (<1% to 2%), flatulence (1%)

Neuromuscular & skeletal: Weakness (3%)

Miscellaneous: Diaphoresis (2%)

<2% (Limited to important or life-threatening): Abdominal enlargement/pain, anemia, amblyopia, anxiety, arthritis, back pain, chest pain, chills, edema, euphoria, hyperkinesias, hypertonia, hypokalemia, hypotension, hypoxia, ileus, infection, LFTs increased, lung disorder, pharyngitis, syncope, rash, tachycardia, taste perversion, thrombophlebitis, urinary retention

Metabolism/Transport Effects

Oxycodone: **Substrate** (minor) of CYP2D6, 3A

Ibuprofen: **Substrate** (minor) of CYP2C9, 2C19; **Inhibits** CYP2C9 (strong)

Drug Interactions

ACE Inhibitors: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Aminoglycosides: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Angiotensin II Receptor Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Anticoagulants: Nonsteroidal Anti-Inflammatory Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Antiplatelet Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Beta-Blockers: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Nonsteroidal Anti-Inflammatory Agents. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

CycloSPORINE: Nonsteroidal Anti-Inflammatory Agents may enhance the nephrotoxic effect of CycloSPORINE. Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Strong) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy*

modification

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Eplerenone: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of Eplerenone. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk D: Consider therapy modification*

HydrALAZINE: Nonsteroidal Anti-Inflammatory Agents may diminish the antihypertensive effect of HydrALAZINE. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. *Risk X: Avoid combination*

Lithium: Nonsteroidal Anti-Inflammatory Agents may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the diuretic effect of Loop Diuretics. *Risk C: Monitor therapy*

Methotrexate: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Methotrexate. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of other Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Pemetrexed: NSAID (Nonselective) may decrease the excretion of Pemetrexed. *Risk D: Consider therapy modification*

Probenecid: May increase the serum concentration of Nonsteroidal Anti-Inflammatory Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: Nonsteroidal Anti-Inflammatory Agents may enhance the neuroexcitatory and/or seizure-potentiating effect of Quinolone Antibiotics. *Risk C: Monitor therapy*

Salicylates: NSAID (Nonselective) may enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Choline Magnesium Trisalicylate. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Serotonin/Norepinephrine Reuptake Inhibitors: May enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Thiazide Diuretics: Nonsteroidal Anti-Inflammatory Agents may diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Thrombolytic Agents: Nonsteroidal Anti-Inflammatory Agents may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Nonsteroidal Anti-Inflammatory Agents. Bleeding may occur. *Risk C: Monitor therapy*

Vancomycin: Nonsteroidal Anti-Inflammatory Agents may decrease the excretion of Vancomycin. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): NSAID (Nonselective) may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Based on **oxycodone** component:

Ethanol: Avoid or limit ethanol (may increase CNS depression). Watch for sedation.

Based on **ibuprofen** component:

Ethanol: Avoid ethanol (may enhance gastric mucosal irritation).

Food: Food or milk are recommended to decrease gastric irritation.

Herb/Nutraceutical: Avoid alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American, Panax, Siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAMe (S-adenosylmethionine), sweet clover, turmeric, white willow (all have additional antiplatelet activity).

Monitoring ParametersRespiratory function

Nursing: Physical Assessment/MonitoringSee individual agents.

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: Oxycodone 5 mg and ibuprofen 400 mg

Combunox™: 5/400: Oxycodone 5 mg and ibuprofen 400 mg

Generic AvailableYes

ManufacturerForest Pharmaceuticals, Inc

Pricing: U.S. (www.drugstore.com)

Tablets (Combunox)

5-400 mg (20): $39.51

Tablets (Oxycodone-Ibuprofen)

5-400 mg (20): $33.33

Mechanism of Action

Oxycodone: Binds to opiate receptors in the CNS, causing inhibition of ascending pain pathways, altering the perception of and response to pain; produces generalized CNS depression

Ibuprofen: Reversibly inhibits cyclooxygenase-1 and 2 (COX-1 and 2) enzymes, which result in decreased formation of prostaglandin precursors; has antipyretic, analgesic, and anti-inflammatory properties

Pharmacodynamics/KineticsAlso see individual agents.

Absorption: Ibuprofen, oxycodone: rapidly absorbed

Protein binding: Ibuprofen: 99%; Oxycodone: 45%

Metabolism: Oxycodone: Hepatic to metabolites, noroxycodone (major), and oxymorphone (minor)

Bioavailability: Oxycodone: increased with food (25%)

Half-life elimination: Ibuprofen: 1.8-2.6 hours; Oxycodone: 3.1-3.7 hours

Time to peak, serum: Ibuprofen: 1.6-3.1 hours; Oxycodone 1.3-2.1 hours

Excretion: Ibuprofen: Urine (<0.2% unchanged); Oxycodone: Urine (~4 % unchanged)

Dental Health Professional ConsiderationsThe combination of oxycodone and ibuprofen in this dose form is appropriate for the management of moderate-to-severe pain when the concomitant anti-inflammatory action of ibuprofen is desired. Oxycodone is recommended only for limited acute dosing (ie, ≤3 days). Oxycodone has an addictive liability, especially when given long term.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Nausea, sedation, dizziness. See Dental Comment.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness and sedation are common; may cause anxiety or euphoria

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive sedative effects. Oxycodone may cause severe hypotension after concurrent administration with drugs which compromise vasomotor tone, such as phenothiazines; monitor blood pressure. May cause GI side effects; concomitant use with SSRIs, lithium, valproic acid may produce additive effects; monitor. May cause platelet abnormalities which may be potentiated with concurrent SSRI use; monitor. Ibuprofen component may decrease lithium clearance resulting in an increase in serum lithium levels and potentially lithium toxicity; monitor serum lithium levels.

Index TermsIbuprofen and Oxycodone

OxyCODONE

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

OxyCODONE may be confused with HYDROcodone, OxyContin®, oxymorphone

OxyContin® may be confused with MS Contin®, oxybutynin

OxyFast® may be confused with Roxanol™

Roxicodone® may be confused with Roxanol™

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(oks i KOE done)

U.S. Brand NamesETH-Oxydose™; OxyContin®; OxyFast®; OxyIR®; Roxicodone®

Canadian Brand NamesOxy.IR®; OxyContin®; PMS-Oxycodone; Supeudol®

Pharmacologic CategoryAnalgesic, Opioid

Use: Labeled IndicationsManagement of moderate-to-severe pain, normally used in combination with nonopioid analgesics

OxyContin® is indicated for around-the-clock management of moderate-to-severe pain when an analgesic is needed for an extended period of time.

Use: DentalTreatment of postoperative pain

Dosing: Adults**Management of pain:** Oral:

Regular or immediate release formulations: 2.5-5 mg every 6 hours as needed

Controlled release:

Opioid naive: 10 mg every 12 hours

Concurrent CNS depressants: Reduce usual dose by $^{1}/_{3}$ to $^{1}/_{2}$

Conversion from transdermal fentanyl: For each 25 mcg/hour transdermal dose, substitute 10 mg controlled release oxycodone every 12 hours; should be initiated 18 hours after the removal of the transdermal fentanyl patch

Currently on opioids: Use standard conversion chart to convert daily dose to oxycodone equivalent. Divide daily dose in 2 (for twice-daily dosing, usually every 12 hours) and round down to nearest dosage form.

Note: 60 mg, 80 mg, or 160 mg tablets are for use **only** in opioid-tolerant patients. Special safety considerations must be addressed when converting to OxyContin® doses ≥160 mg every 12 hours. Dietary caution must be taken when patients are initially titrated to 160 mg tablets. Using different strengths to obtain the same daily dose is equivalent (eg, four 40 mg tablets, two 80 mg tablets, one 160 mg tablet); all produce similar blood levels.

Multiplication factors for converting the daily dose of current oral opioid to the daily dose of oral oxycodone:

Current opioid mg/day dose x factor = Oxycodone mg/day dose

Codeine mg/day oral dose **x** 0.15 = Oxycodone mg/day dose

Hydrocodone mg/day oral dose **x** 0.9 = Oxycodone mg/day dose

Hydromorphone mg/day oral dose **x** 4 = Oxycodone mg/day dose

Levorphanol mg/day oral dose **x** 7.5 = Oxycodone mg/day dose

Meperidine mg/day oral dose **x** 0.1 = Oxycodone mg/day dose

Methadone mg/day oral dose **x** 1.5 = Oxycodone mg/day dose

Morphine mg/day oral dose **x** 0.5 = Oxycodone mg/day dose

Note: Divide the oxycodone mg/day dose into the appropriate dosing interval for the specific form being used.

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricOral: Regular or immediate release formulations:

6-12 years: 1.25 mg every 6 hours as needed

>12 years: 2.5 mg every 6 hours as needed

Dosing: Hepatic ImpairmentReduce dosage in patients with severe liver disease.
Calculations

- Fentanyl Transdermal Conversion
- Opioid Agonist Conversion

Administration: OralDo not crush, break, or chew controlled-release tablets; 60 mg, 80 mg, and 160 mg tablets are for use **only** in opioid-tolerant patients. Do not administer OxyContin® 160 mg tablet with a high-fat meal. Controlled release tablets are not indicated for rectal administration; increased risk of adverse events due to better rectal absorption.
Dietary ConsiderationsInstruct patient to avoid high-fat meals when taking OxyContin® 160 mg tablets.
StorageStore at 15°C to 30°C (59°F to 86°F). Protect from light.
RestrictionsC-II
ContraindicationsHypersensitivity to oxycodone or any component of the formulation; significant respiratory depression; hypercarbia; acute or severe bronchial asthma; OxyContin® is also contraindicated in paralytic ileus (known or suspected); pregnancy (prolonged use or high doses at term)
Allergy Considerations

- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Abuse/misuse/diversion: See "Other warnings/precautions" below.
- Controlled-release tablets: See "Dosage form specific issues" below.

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hypotension: May cause hypotension; use with caution in patients with hypovolemia, cardiovascular disease (including acute MI), or drugs which may exaggerate hypotensive effects (including phenothiazines or general anesthetics).
- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene-derivative opioid agonists (codeine, hydrocodone, hydromorphone, levorphanol, oxymorphone).

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Adrenocortical insufficiency: Use with caution in patients with adrenocortical insufficiency, including Addison's disease.
- Biliary tract impairment: Use with caution in patients with biliary tract dysfunction; acute pancreatitis may cause constriction of sphincter of Oddi.
- CNS depression/coma: Use with caution in patients with CNS depression or coma.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.
- Hepatic impairment: Use with caution in patients with severe hepatic dysfunction.
- Obesity: Use with caution in patients who are morbidly obese.
- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.
- Psychosis: Use with caution in patients with toxic psychosis.
- Renal impairment: Use with caution in patients with severe renal dysfunction.
- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages.
- Seizures: Use with caution in patients with a history of seizure disorders.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.

Dosage form specific issues:

- Controlled-release tablets: **[U.S. Boxed Warning]: OxyContin® is not intended for use as an "as needed" analgesic or for immediately-postoperative pain management** (should be used postoperatively only if the patient has received it prior to surgery or if severe, persistent pain is anticipated). **[U.S. Boxed Warning]: Do NOT crush, break, or chew controlled-release tablets;** 60 mg, 80 mg, and 160 mg strengths are for use only in opioid-tolerant patients.

- Latex sensitivity: Use the oral concentrate formulation with caution in patients with latex sensitivity; dropper dispenser contains dry, natural rubber.

Other warnings/precautions:

- Abuse/misuse/diversion: **[U.S. Boxed Warning]: Healthcare provider should be alert to problems of abuse, misuse, and diversion.**

- Withdrawal: Concurrent use of agonist/antagonist analgesics may precipitate withdrawal symptoms and/or reduced analgesic efficacy in patients following prolonged therapy with mu opioid agonists. Abrupt discontinuation following prolonged use may also lead to withdrawal symptoms.

Geriatric ConsiderationsThe elderly may be particularly susceptible to the CNS depressant and constipating effects of narcotics. Prophylactic use of a laxative should be considered. Serum levels at a given dose may also be increased relative to concentrations in younger patients.

Pregnancy Risk FactorB/D (prolonged use or high doses at term)

Pregnancy ConsiderationsShould be used in pregnancy only if clearly needed. Use of narcotics during pregnancy may produce physical dependence in the neonate; respiratory depression may occur in the newborn if narcotics are used prior to delivery (especially high doses).

LactationEnters breast milk/use caution

Adverse Reactions

>10%:

Central nervous system: Somnolence (23% to 24%), dizziness (13% to 16%)

Dermatologic: Pruritus (12% to 13%)

Gastrointestinal: Nausea (23% to 27%), constipation (23% to 26%), vomiting (12% to 14%)

1% to 10%:

Cardiovascular: Postural hypotension (1% to 5%)

Central nervous system: Headache (7% to 8%), abnormal dreams (1% to 5%), anxiety (1% to 5%), chills (1% to 5%), confusion (1% to 5%), euphoria (1% to 5%), fever (1% to 5%), insomnia (1% to 5%), nervousness (1% to 5%), thought abnormalities (1% to 5%)

Dermatologic: Rash (1% to 5%)

Gastrointestinal: Xerostomia (6% to 7%), abdominal pain (1% to 5%), anorexia (1% to 5%), diarrhea (1% to 5%), dyspepsia (1% to 5%), gastritis (1% to 5%)

Neuromuscular & skeletal: Weakness (6% to 7%), twitching (1% to 5%)

Respiratory: Dyspnea (1% to 5%), hiccups (1% to 5%)

Miscellaneous: Diaphoresis (5% to 6%)

<1% (Limited to important or life-threatening): Agitation, amenorrhea, amnesia, anaphylaxis, anaphylactoid reaction, appetite increased, chest pain, cough, dehydration, depression, dysphagia, dysuria, edema, emotional lability, eructation, exfoliative dermatitis, facial edema, hallucinations, hematuria, histamine release, hyperkinesia, hypoesthesia, hyponatremia, hypotonia, ileus, impotence, intracranial pressure increased, libido decreased, malaise, migraine, paradoxical CNS stimulation, paralytic ileus, paresthesia, pharyngitis, physical dependence, polyuria, psychological dependence, seizure, SIADH, speech disorder, ST segment depression, stomatitis, stupor, syncope, tablet in stool (OxyCodone®), taste perversion, thirst, tinnitus, tremor, urinary retention, urticaria, vasodilation, vertigo, vision change, voice alteration, withdrawal syndrome

Metabolism/Transport Effects**Substrate** (minor) of CYP2D6, 3A

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: When taken with a high-fat meal, peak concentration is 25% greater following a single OxyContin® 160 mg tablet as compared to two 80 mg tablets.

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Test InteractionsSome quinolones may produce a false-positive urine screening result for opiates using commercially-available immunoassay kits. This has been demonstrated most consistently for levofloxacin and ofloxacin, but other quinolones have shown cross-reactivity in certain assay kits. Confirmation of positive opiate screens by more specific methods should be considered.

Monitoring ParametersPain relief, respiratory and mental status, blood pressure

Reference RangeBlood level of 5 mg/L associated with fatality

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for additive or adverse interactions. Monitor for effectiveness of pain relief and monitor for signs of overdose. Monitor vital signs, CNS and respiratory status, and degree of sedation at beginning of therapy and at regular intervals with long-term use. May cause physical and/or psychological dependence. For inpatients, implement safety measures. Assess knowledge/teach patient appropriate use (if self-administered). Teach patient to monitor for adverse reactions, adverse reactions to report, and appropriate interventions to reduce side effects.

Patient EducationIf self-administered, use exactly as directed; do not increase dose or frequency. Drug may cause physical and/or psychological dependence. Do not crush or chew controlled-release tablets. While using this medication, do not use alcohol and other prescription or OTC medications (especially sedatives, tranquilizers, antihistamines, or pain medications) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause hypotension, dizziness, drowsiness, impaired coordination, or blurred vision (use caution when driving, climbing stairs, or changing position - rising from sitting or lying to standing, or when engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, or dry mouth (frequent mouth care, small frequent meals, chewing gum, or sucking lozenges may help); or constipation (increased exercise, fluids, fruit, or fiber may help; if unresolved, consult prescriber about use of stool softeners). The wax matrix from OxyContin® tablets may appear in stool. Report persistent dizziness or headache; excessive fatigue or sedation; changes in mental status; changes in urinary elimination or pain on urination; weakness or trembling; blurred vision; or shortness of breath. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. If you are breast-feeding, take medication immediately after breast-feeding or 3-4 hours prior to next feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, immediate release, as hydrochloride: 5 mg

OxyIR®: 5 mg

Liquid, oral, as hydrochloride [concentrate]:

Roxicodone®: 20 mg/mL (30 mL) [contains sodium benzoate]

Solution, oral, as hydrochloride: 5 mg/5 mL (500 mL)

Roxicodone®: 5 mg/5 mL (5 mL, 500 mL) [contains ethanol]

Solution, oral, as hydrochloride [concentrate]: 20 mg/mL (30 mL)

ETH-Oxydose™: 20 mg/mL (1 mL, 30 mL) [contains sodium benzoate; berry flavor]

OxyFast®: 20 mg/mL (30 mL) [contains natural rubber/natural latex in packaging and sodium benzoate]

Tablet, as hydrochloride: 5 mg, 10 mg, 15 mg, 20 mg, 30 mg

Roxicodone®: 5 mg, 15 mg, 30 mg

Tablet, controlled release, as hydrochloride:

OxyContin®: 10 mg, 15 mg, 20 mg, 30 mg, 40 mg, 60 mg, 80 mg, 160 mg

Tablet, extended release, as hydrochloride: 10 mg, 20 mg, 40 mg, 80 mg [DSC]

Generic AvailableYes

Tablets (Roxicodone)

15 mg (20): $31.60

30 mg (20): $49.99

Mechanism of ActionBinds to opiate receptors in the CNS, causing inhibition of ascending pain pathways, altering the perception of and response to pain; produces generalized CNS depression

Pharmacodynamics/Kinetics

Onset of action: Pain relief: 10-15 minutes

Peak effect: 0.5-1 hour

Duration: Immediate release: 3-6 hours; Controlled release: ≤12 hours

Distribution: V_d: 2.6 L/kg; distributed to skeletal muscle, liver, intestinal tract, lungs, spleen, brain, and breast milk

Protein binding: ~45%

Metabolism: Hepatically via CYP3A4 to noroxycodone (has weak analgesic), noroxymorphone, and alpha- and beta-noroxycodol. CYP2D6 mediated metabolism produces oxymorphone (has analgesic activity; low plasma concentrations), alpha- and beta-oxymorphol.

Bioavailability: Controlled release, immediate release: 60% to 87%

Half-life elimination: Immediate release: 2-3 hours; controlled release: ~5 hours

Excretion: Urine (~19% as parent; > 64% as metabolites)

Pharmacotherapy PearlsProphylactic use of a laxative should be considered. OxyContin® 60 mg, 80 mg, and 160 mg tablets are for use in opioid-tolerant patients only.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness and dizziness are common; may cause agitation, confusion, amnesia, depression, emotional lability, hallucinations, and malaise

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may cause additive sedation; use lower doses of both agents. Oxycodone may cause severe hypotension after concurrent administration with drugs which compromise vasomotor tone (eg, phenothiazines); monitor blood pressure.

Cardiovascular ConsiderationsOxycodone may cause constipation which may be problematic in patients with unstable angina, and patients after myocardial infarction. The hemodynamic responses to valsalva-like maneuvers due to straining may have adverse cardiovascular consequences in patients with critical coronary artery disease.

Index Terms Dihydrohydroxycodeinone; Oxycodone Hydrochloride

Oxygen

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(OKS i jen)

Pharmacologic CategoryDental Gases

Use: Labeled IndicationsTreatment of various clinical disorders, both respiratory and nonrespiratory; relief of arterial hypoxia and secondary complications; treatment of pulmonary hypertension, polycythemia secondary to hypoxemia, chronic disease states complicated by anemia, cancer, migraine headaches, coronary artery disease, seizure disorders, sickle-cell crisis, and sleep apnea

Use: DentalAdministered as a supplement with nitrous oxide to ensure adequate ventilation during sedation; a resuscitative agent for medical emergencies in dental office

Dosing: AdultsChildren and Adults: Average rate of 2 L/minute

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

ContraindicationsNo data reported

Warnings/Precautions

Concerns related to adverse effects:

- Hypoventilation: Oxygen-induced hypoventilation is the greatest potential hazard of oxygen therapy. In patients with severe COPD, the respiratory drive results from hypoxic stimulation of the carotid chemoreceptors. If this hypoxic drive is diminished by excessive oxygen therapy, hypoventilation may occur and further carbon dioxide retention with possible cessation of ventilation.

- Pulmonary fibrosis: Extended exposure to higher O_2 concentrations has been associated with pulmonary fibrosis.

Pregnancy Risk FactorNo data reported

Adverse ReactionsNo data reported

Drug InteractionsNo data reported

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Liquid system with large reservoir holding 75-100 lb of liquid oxygen; compressed gas system consisting of high-pressure tank; tank sizes are "H" (6900 L of oxygen), "E" (622 L of oxygen) and "D" (356 L of oxygen)

Generic AvailableYes

Mechanism of ActionIncreased oxygen in tidal volume and oxygenation of tissues at molecular level

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsLow levels of oxygen may hold promise in the management of patients with heart failure and Cheyne-Stokes breathing.

International Brand NamesOxygenium (PL)

Oxymetazoline

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Oxymetazoline may be confused with oxymetholone

Afrin® may be confused with aspirin

Visine® may be confused with Visken®

Pronunciation(oks i met AZ oh leen)
U.S. Brand Names4-Way® 12 Hour [OTC]; Afrin® Extra Moisturizing [OTC]; Afrin® Original [OTC]; Afrin® Severe Congestion [OTC]; Afrin® Sinus [OTC]; Dristan™ 12-Hour [OTC]; Duramist® Plus [OTC]; Duration® [OTC] [DSC]; Genasal [OTC]; Mucinex® Full force™ [OTC]; Mucinex® moisture smart™ [OTC]; Neo-Synephrine® 12 Hour Extra Moisturizing [OTC]; Neo-Synephrine® 12 Hour [OTC]; NRS® [OTC]; Nōstrilla® [OTC]; Vicks Sinex® 12 Hour Ultrafine Mist [OTC]; Vicks Sinex® 12 Hour [OTC]; Vicks® Early Defense™ [OTC]; Visine® L.R. [OTC]
Canadian Brand NamesClaritin® Allergic Decongestant; Dristan® Long Lasting Nasal; Drixoral® Nasal
Pharmacologic CategoryAdrenergic Agonist Agent; Imidazoline Derivative; Vasoconstrictor
Use: Labeled IndicationsAdjunctive therapy of middle ear infections, associated with acute or chronic rhinitis, the common cold, sinusitis, hay fever, or other allergies

Ophthalmic: Relief of redness of eye due to minor eye irritations

Use: DentalSymptomatic relief of nasal mucosal congestion
Dosing: Adults

Nasal congestion: Intranasal (therapy should not exceed 3 days): 0.05% solution: Instill 2-3 sprays into each nostril twice daily

Relief of eye redness: Ophthalmic: 0.025% solution: Instill 1-2 drops in affected eye(s) every 6 hours as needed or as directed by healthcare provider

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Nasal congestion: Intranasal: Children ≥6 years: Refer to adult dosing.

Relief of eye redness: Ophthalmic: Children ≥6 years: 0.025% solution: Instill 1-2 drops in affected eye(s) every 6 hours as needed or as directed by healthcare provider

StorageStore at room temperature.
ContraindicationsHypersensitivity to oxymetazoline or any component of the formulation
Warnings/Precautions

Dosage form specific issues:

- Nasal: Rebound congestion may occur with extended use (>3 days). Prior to self-medication (OTC use), contact healthcare provider in the presence of hypertension, diabetes, hyperthyroidism, heart disease, coronary artery disease, cerebral arteriosclerosis, or long-standing bronchial asthma.

- Ophthalmic: Prior to OTC use, contact healthcare provider in the presence of glaucoma or if needed for >72 hours.

Geriatric ConsiderationsEvaluate the patient's ability to self-administer. Use with caution in patients with cardiovascular disease.
Adverse ReactionsFrequency not defined.

Cardiovascular: Hypertension, palpitation

Local: Transient burning, stinging

Respiratory: Dryness of the nasal mucosa, rebound congestion with prolonged use, sneezing

Drug Interactions

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Gel, intranasal, as hydrochloride [spray]:

Vicks® Early Defense™: 0.05% (14.7 mL) [microgel; contains benzyl alcohol and menthol]

Solution, intranasal, as hydrochloride [spray]: 0.05% (15 mL, 30 mL)

Afrin® Extra Moisturizing: 0.05% (15 mL) [contains benzyl alcohol and glycerin; regular or no drip formula]

Afrin® Original: 0.05% (15 mL, 30 mL) [contains benzalkonium chloride]

Afrin® Original: 0.05% (15 mL) [contains benzyl alcohol and benzalkonium chloride; no drip formula]

Afrin® Severe Congestion: 0.05% (15 mL) [contains benzyl alcohol and menthol; regular or no drip formula]

Afrin® Sinus: 0.05% (15 mL) [contains benzyl alcohol, benzalkonium chloride, camphor, phenol; regular or no drip formula]

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Oxymetholone may be confused with oxymetazoline, oxymorphone

Pronunciation(oks i METH oh lone)

U.S. Brand NamesAnadrol®-50

Pharmacologic CategoryAnabolic Steroid

Use: Labeled IndicationsTreatment of anemias caused by deficient red cell production

Dosing: Adults**Erythropoietic effects:** Oral: 1-5 mg/kg/day in 1 daily dose; maximum: 100 mg/day; give for a minimum trial of 3-6 months because response may be delayed

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

Dosing: Hepatic Impairment

Mild-to-moderate hepatic impairment: Oxymetholone should be used with caution in patients with liver dysfunction because of its hepatotoxic potential.

Severe hepatic impairment: Oxymetholone should **not** be used.

StorageStore at 15°C to 30°C (59°F to 86°F).

RestrictionsC-III

ContraindicationsHypersensitivity to oxymetholone or any component of the formulation; breast cancer in men; breast cancer in women with hypercalcemia; prostate cancer; severe liver dysfunction; nephrosis; pregnancy

Allergy Considerations

- Androgen Allergy

Warnings/Precautions

Boxed warnings:

- Blood lipid changes: See “Concerns related to adverse effects” below.
- Hepatic effects: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Blood lipid changes: **[U.S. Boxed Warning]: Anabolic steroids may cause blood lipid changes with increased risk of arteriosclerosis.**
- Hepatic effects: **[U.S. Boxed Warning]: Anabolic steroids may cause peliosis hepatis or liver cell tumors which may not be apparent until liver failure or intra-abdominal hemorrhage develops.**

Disease-related concerns:

- Breast cancer: Use with caution in patients with breast cancer; may cause hypercalcemia by stimulating osteolysis.
- Diabetes: Use with caution in patients with diabetes mellitus; monitor carefully.
- Edematous conditions: Use with caution in patients with conditions influenced by edema (eg, cardiovascular disease, migraine, seizure disorder, renal impairment); may cause fluid retention.
- Hepatic impairment: Use with caution in patients with hepatic disease.

Special populations:

- Elderly: Use with caution in elderly patients, they may be at greater risk for prostatic hyperplasia, fluid retention, and transaminase elevations.
- Pediatrics: May accelerate bone maturation without producing compensatory gain in linear growth in children; in prepubertal children perform radiographic examination of the hand and wrist every 6 months to determine the rate of bone maturation and to assess the effect of treatment on the epiphyseal centers.
- Women: Discontinue with evidence of mild virilization in women.

Geriatric ConsiderationsTheoretically, androgens may increase the risk of prostatic hyperplasia.

Pregnancy Risk FactorX

Pregnancy ConsiderationsOligospermia or amenorrhea may occur resulting in an impairment of fertility.

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsFrequency not defined.

Cardiovascular: Coronary artery disease, peripheral edema

Central nervous system: Excitation, insomnia

Dermatologic: Acne (prepubertal males, women), hirsutism (women), hypercalcemia, hyperchloremia, hyperkalemia, hyperphosphatemia, hyperpigmentation, male-pattern baldness (postpubertal males, women)

Endocrine & metabolic: Amenorrhea, cholesterol increased, clitoromegaly, creatinine phosphokinase increased, glucose tolerance decreased, gynecomastia, HDL-cholesterol decreased, hoarseness (women), hypernatremia, impotence (postpubertal males), LDL-cholesterol decreased, libido increased/decreased, menstrual irregularities, oligospermia, phallic enlargement (prepubertal males), priapism (postpubertal males), testicular atrophy (postpubertal males), testicular dysfunction (postpubertal males); virilism (women, high dose); voice deepening (women)

Gastrointestinal: Diarrhea, nausea, vomiting

Genitourinary: Bladder irritability (postpubertal males), epididymitis (postpubertal males), prostatic hyperplasia (elderly males), seminal volume decreased (postpubertal males)

Hematologic: Iron-deficiency anemia, polycythemia, suppression of clotting factors

Hepatic: Cholestatic hepatitis, hepatic necrosis, hepatocellular carcinoma jaundice, liver cell tumors, peliosis hepatis, transaminases increased

Neuromuscular & skeletal: Premature closure of epiphysis (children)

Drug Interactions

CycloSPORINE: Androgens may enhance the hepatotoxic effect of CycloSPORINE. Androgens may increase the serum concentration of CycloSPORINE. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Androgens may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Test InteractionsDecreased thyroxine-binding globulin, T_4; increased resin uptake of T_3 and T_4

Monitoring ParametersLiver function, blood sugars, lipid profile, iron studies, hemoglobin/hematocrit, x-ray of bones every 6 months (prepubertal patients); signs of virilization (females)

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess results of laboratory tests, therapeutic effectiveness (according to purpose of use), and adverse response. Caution patients with diabetes to monitor serum glucose closely (may increase the effect of oral hypoglycemic agents). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report (eg, adverse reactions may differ according to age/gender of patient). **Pregnancy risk factor X:** Determine that patient is not pregnant before starting therapy. Do not give to females of childbearing age unless patient is capable of complying with contraceptive use.

Monitoring: Lab TestsLiver function, blood sugars, lipid profile, iron studies, hemoglobin/hematocrit

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Do not donate blood during or for 1 month following therapy. Take as directed. If you have diabetes, monitor serum glucose closely and notify prescriber of significant changes; medication may increase the effect of insulin and oral hypoglycemic agents. May cause nausea or vomiting (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help) or diarrhea (buttermilk, boiled milk, or yogurt may help). **Males:** Acne, swelling of breasts, loss of libido, impotence. **Females:** Virilism, menstrual irregularity (usually reversible). Report changes in menstrual pattern; enlarged or painful breasts; deepening of voice or unusual growth of body hair; fluid retention (eg, swelling of ankles, feet, or hands, respiratory difficulty, or sudden weight gain); bladder irritability; unresolved CNS changes (eg, nervousness, chills, insomnia); change in color of urine or stool; yellowing of eyes or skin; unusual bruising or bleeding; or other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant during or for 1 month following therapy. This drug may cause severe fetal defects. Consult prescriber for instruction on appropriate contraceptive measures. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Anadrol®-50: 50 mg

Generic AvailableNo

Mechanism of ActionEnhances the production and urinary excretion of erythropoietin in patients with anemias due to bone marrow failure; stimulates erythropoiesis in anemias due to deficient red cell production.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause insomnia

Mental Health: Effects on Psychiatric TreatmentNone reported

International Brand NamesAdroyd (IN); Anapolon (PL); Anasteronal (ES); Androlic (TH); Hemogenin (BR); Oxitosona (ES); Roboral (IL); Synasteron (BE); Zenalosyn (NL)

Oxymorphone

Lexi-Drugs Online

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Oxymorphone may be confused with oxycodone, oxymetholone

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(oks i MOR fone)

U.S. Brand NamesOpana®; Opana® ER

Pharmacologic CategoryAnalgesic, Opioid

Use: Labeled Indications

Parenteral: Management of moderate-to-severe pain and preoperatively as a sedative and/or supplement to anesthesia

Oral, regular release: Management of moderate-to-severe pain

Oral, extended release: Management of moderate-to-severe pain in patients requiring around-the-clock opioid treatment for an extended period of time

Dosing: AdultsAnalgesia: **Note:** Dosage must be individualized.

I.M., SubQ: Initial: 1-1.5 mg; may repeat every 4-6 hours as needed

Labor analgesia: I.M.: 0.5-1 mg

I.V.: Initial: 0.5 mg

Oral:

Immediate release:

Opioid-naive: 10-20 mg every 4-6 hours as needed. Initial dosages as low as 5 mg may be considered in selected patients and/or patients with renal impairment. Dosage adjustment should be based on level of analgesia, side effects, and pain intensity. Initiation of therapy with initial dose >20 mg is **not** recommended.

Currently on stable dose of parenteral oxymorphone: ~10 times the daily parenteral requirement. The calculated amount should be divided and given in 4-6 equal doses.

Currently on other opioids: Use standard conversion chart to convert daily dose to oxymorphone equivalent. Generally start with $^1/_2$ the calculated daily oxymorphone dosage and administered in divided doses every 4-6 hours.

Extended release (Opana® ER):

Opioid-naive: Initial: 5 mg every 12 hours. Supplemental doses of immediate-release oxymorphone may be used as “rescue” medication as dosage is titrated.

Note: Continued requirement for supplemental dosing may be used to titrate the dose of extended-release continuous therapy. Adjust therapy incrementally, by 5-10 mg every 12 hours at intervals of every 3-7 days. Ideally, basal dosage may be titrated to generally mild pain or no pain with the regular use of fewer than 2 supplemental doses per 24 hours.

Currently on stable dose of parenteral oxymorphone: Approximately 10 times the daily parenteral requirement. The calculated amount should be given in 2 divided doses (every 12 hours).

Currently on opioids: Use conversion chart (see Note below) to convert daily dose to oxymorphone equivalent. Generally start with $^1/_2$ the calculated daily oxymorphone dosage. Divide daily dose in 2 (for every 12-hour dosing) and round down to nearest dosage form. **Note:** Per manufacturer, the following approximate oral dosages are equivalent to oxymorphone 10 mg:

Hydrocodone 20 mg

Oxycodone 20 mg

Methadone 20 mg

Morphine 30 mg

Conversion of stable dose of immediate-release oxymorphone to extended-release oxymorphone: Administer $^1/_2$ of the daily dose of immediate-release oxymorphone (Opana®) as the extended-release formulation (Opana® ER) every 12 hours

Dosing: ElderlyRefer to adult dosing. **Note:** Initiate dosing at the lower end of the dosage range.

Dosing: Renal ImpairmentCl_{cr} <50 mL/minute: Reduce initial dosage of oral formulations (bioavailability increased 57% to 65%). Begin therapy at lowest dose and titrate carefully.

Dosing: Hepatic ImpairmentGenerally, contraindicated for use in patients with moderate-to-severe liver disease. Initiate with lowest possible dose and titrate slowly in mild impairment.

Administration: I.V. DetailpH: 2.7-4.5

Administration: OralAdminister immediate release and extended release tablets 1 hour before or 2 hours after eating. Opana® ER tablet should be swallowed; do not break, crush, or chew.

Dietary ConsiderationsImmediate release and extended release tablets should be taken 1 hour before or 2 hours after eating.

StorageInjection solution, tablet: Store at 15°C to 30°C (59°F to 86°F).

Compatibility**Compatibility in syringe: Compatible:** Glycopyrrolate, hydroxyzine, ranitidine.

RestrictionsC-II

ContraindicationsHypersensitivity to oxymorphone, other morphine analogs (phenanthrene derivatives), or any component of the formulation; paralytic ileus (known or suspected); increased intracranial pressure; moderate-to-severe hepatic impairment; severe respiratory depression (unless in monitored setting with resuscitative equipment); acute/severe bronchial asthma; hypercarbia; pregnancy (prolonged use or high doses at term).

Note: Injection formulation is also contraindicated in the treatment of upper airway obstruction and pulmonary edema due to a chemical respiratory irritant.

Allergy Considerations

- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Abuse/misuse/diversion: See “Other warnings/precautions” below.
- Opana® ER: See “Dosage form specific issues” below.

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hypotension: May cause hypotension; use with caution in patients with hypovolemia, cardiovascular disease (including acute MI), or with drugs which may exaggerate hypotensive effects (including phenothiazines or general anesthetics).
- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene-derivative opioid agonists (codeine, hydrocodone, hydromorphone, levorphanol, oxymorphone).

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.
- Biliary tract impairment: Use with caution in patients with biliary tract dysfunction; acute pancreatitis may cause constriction of sphincter of Oddi.
- CNS depression/coma: Use with caution in patients with CNS depression or coma.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.
- Hepatic impairment: Use with caution in patients with mild hepatic dysfunction; use is contraindicated in moderate-to-severe impairment.
- Obesity: Use with caution in patients who are morbidly obese.
- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Opana® ER: **[U.S. Boxed Warnings]: Opana® ER is an extended release oral formulation of oxymorphone and is not suitable for use as an "as needed" analgesic. Tablets should not be broken, chewed, dissolved, or crushed; tablets should be swallowed whole.** Opana® ER is intended for use in long-term, continuous management of moderate-to-severe chronic pain. It is not indicated for use in the immediate postoperative period (12-24 hours). **[U.S. Boxed Warning]: The coingestion of ethanol or ethanol-containing medications with Opana® ER may result in accelerated release of drug from the dosage form, abruptly increasing plasma levels, which may have fatal consequences.**

Other warnings/precautions:

- Abuse/misuse/diversion: **[U.S. Boxed Warning]: Healthcare provider should be alert to problems of abuse, misuse, and diversion.**

- Optimal regimen: An opioid-containing analgesic regimen should be tailored to each patient's needs and based upon the type of pain being treated (acute versus chronic), the route of administration, degree of tolerance for opioids (naive versus chronic user), age, weight, and medical condition. The optimal analgesic dose varies widely among patients; doses should be titrated to pain relief/prevention.

- Withdrawal: Concurrent use of agonist/antagonist analgesics may precipitate withdrawal symptoms and/or reduced analgesic efficacy in patients following prolonged therapy with mu opioid agonists. Abrupt discontinuation following prolonged use may also lead to withdrawal symptoms.

Geriatric ConsiderationsElderly may be particularly susceptible to the CNS depressant and constipating effects of narcotics. Plasma levels of oxymorphone were about 40% higher in elderly patients as compared to younger patients.

Pregnancy Risk FactorC/D (prolonged use or high doses at term)

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies, however, decreased fetal weight, decreased litter size, increased stillbirths, and increased neonatal death were noted. Chronic opioid use during pregnancy may lead to a withdrawal syndrome in the neonate. Symptoms include irritability, hyperactivity, loss of sleep pattern, abnormal crying, tremor, vomiting, diarrhea, weight loss, or failure to gain weight. Opioid analgesics are considered pregnancy risk factor D if used for prolonged periods or in larger doses near term.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsFrequency not defined.

Cardiovascular: Bradycardia, cardiac shock, flushing, hypotension, orthostatic hypotension, palpitation, peripheral vasodilation, shock, tachycardia

Central nervous system: Agitation, amnesia, anorexia, anxiety, CNS depression, coma, confusion, convulsion, dizziness, drowsiness, dysphoria, euphoria, fatigue, fever, hallucinations, headache, insomnia, intracranial pressure increased, malaise, mental depression, mental impairment, nervousness, restlessness, paradoxical CNS stimulation

Dermatologic: Pruritus, urticaria, rash

Endocrine & metabolic: Antidiuretic hormone release, weight loss

Gastrointestinal: Abdominal pain, appetite depression, biliary tract spasm, constipation, dehydration, dry mouth, dyspepsia, flatulence, nausea, paralytic ileus, stomach cramps, vomiting, xerostomia

Genitourinary: Urination decreased, urinary retention, urinary tract spasm

Local: Pain/reaction at injection site

Neuromuscular & skeletal: Weakness

Ocular: Blurred vision, diplopia, miosis

Renal: Oliguria

Respiratory: Apnea, bronchospasm, cyanosis, dyspnea, hypoventilation, laryngeal edema, laryngeal spasm, respiratory depression

Miscellaneous: Diaphoresis, histamine release, physical and psychological dependence

Oncology: VesicantNo

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression). Ethanol ingestion with extended-release tablets is specifically contraindicated due to possible accelerated release and potentially fatal overdose.

Food: When taken orally with a high-fat meal, peak concentration is 38% to 50% greater. Both immediate-release and extended-release tablets should be taken 1 hour before or 2 hours after eating.

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Test InteractionsSome quinolones may produce a false-positive urine screening result for opiates using commercially-available immunoassay kits. This has been demonstrated most consistently for levofloxacin and ofloxacin, but other quinolones have shown cross-reactivity in certain assay kits. Confirmation of positive opiate screens by more specific methods should be considered. May cause elevation in amylase (due to constriction of the sphincter of Oddi).

Monitoring ParametersRespiratory rate, heart rate, blood pressure, CNS activity

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for additive or adverse interactions. Monitor therapeutic effectiveness, adverse reactions, and signs of overdose at beginning of therapy and at regular intervals with long-term use. Monitor blood pressure, CNS and respiratory status, and degree of sedation. May cause physical and/or psychological dependence. For inpatients, implement safety measures. Assess knowledge/teach patient appropriate use (if self-administered). Teach patient to monitor for adverse reactions, adverse reactions to report, and appropriate interventions to reduce side effects.

Patient EducationIf self-administered, use exactly as directed; do not increase dose or frequency or discontinue this medicine without consulting prescriber. Drug may cause physical and/or psychological dependence. Do not break, chew, dissolve, or crush extended release tablets. Swallow whole. While using this medication, do not use alcohol and other prescription or OTC medications (especially sedatives, tranquilizers, antihistamines, or pain medications) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause hypotension, dizziness, drowsiness, impaired coordination, or blurred vision (use caution when driving, climbing stairs, or changing position - rising from sitting or lying to standing, or when engaging in tasks requiring alertness until response to drug is known); nausea, vomiting or dry mouth (frequent mouth care, small frequent meals, chewing gum, or sucking lozenges may help); or constipation (increased exercise, fluids, fruit, or fiber may help; if unresolved, consult prescriber about use of stool softeners). Report persistent dizziness or headache; excessive fatigue or sedation; changes in mental status; changes in urinary elimination or pain on urination; weakness or trembling; blurred vision; or shortness of breath. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as hydrochloride:

Opana®: 1 mg/mL (1 mL)

Tablet, as hydrochloride:

Opana®: 5 mg, 10 mg

Tablet, extended release, as hydrochloride:

Opana®: ER: 5 mg, 7.5 mg, 10 mg, 15 mg, 20 mg, 30 mg, 40 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablet, 12-hour (Opana ER)

5 mg (20): $39.99

7.5 mg (20): $49.99

10 mg (20): $69.33

15 mg (20): $89.99

20 mg (20): $124.79

30 mg (20): $169.99

Tablets (Opana)

5 mg (20): $61.53

Mechanism of ActionOxymorphone hydrochloride (Numorphan®) is a potent narcotic analgesic with uses similar to those of morphine. The drug is a semisynthetic derivative of morphine (phenanthrene derivative) and is closely related to hydromorphone chemically (Dilaudid®).

Pharmacodynamics/Kinetics

Onset of action: Parenteral: 5-10 minutes

Duration: Analgesic: Parenteral: 3-6 hours

Distribution: V_d: I.V.: 1.94-4.22 L/kg

Protein binding: 10% to 12%

Metabolism: Hepatic via glucuronidation to active and inactive metabolites

Bioavailability: Oral: 10%

Half-life elimination: Oral: Immediate release: 7-9 hours; Extended release: 9-11 hours

Excretion: Urine (<1% as unchanged drug); feces

Related Information

- Narcotic / Opioid Analgesics

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation). Anticholinergic side effects can cause a reduction of saliva production or secretion, contributing to discomfort and dental disease (ie, caries, oral candidiasis, and periodontal disease).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness and dizziness are common; may cause nervousness, restlessness or confusion; may rarely cause depression or hallucinations

Mental Health: Effects on Psychiatric TreatmentPsychotropics may alter the analgesic effects of opioids; monitor for change in pain relief

Cardiovascular ConsiderationsOxymorphone may cause constipation which may be problematic in patients with unstable angina, and patients after myocardial infarction. The hemodynamic responses to valsalva-like maneuvers due to straining may have adverse cardiovascular consequences in patients with critical coronary artery disease.

Index TermsOxymorphone Hydrochloride

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Pitocin® may be confused with Pitressin®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(oks i TOE sin)

U.S. Brand NamesPitocin®

Canadian Brand NamesPitocin®; Syntocinon®

Pharmacologic CategoryOxytocic Agent

Use: Labeled IndicationsInduction of labor at term; control of postpartum bleeding; adjunctive therapy in management of abortion

Dosing: Adults**Note:** I.V. administration requires the use of an infusion pump.

Induction of labor: I.V.: 0.5-1 milliunits/minute; gradually increase dose in increments of 1-2 milliunits/minute until desired contraction pattern is established; dose may be decreased after desired frequency of contractions is reached and labor has progressed to 5-6 cm dilation. Infusion rates of 6 milliunits/minute provide oxytocin levels similar to those at spontaneous labor; rates >9-10 milliunits/minute are rarely required.

Postpartum bleeding:

I.M.: Total dose of 10 units after delivery

I.V.: 10-40 units by I.V. infusion in 1000 mL of intravenous fluid at a rate sufficient to control uterine atony

Adjunctive treatment of abortion: I.V.: 10-20 milliunits/minute; maximum total dose: 30 units/12 hours

Administration: I.V.Refer to Reconstitution for dilution information. An infusion pump is required for administration.

StorageStore oxytocin at 2°C to 8°C (36°F to 46°F); do not freeze. Pitocin® may also be stored at 15°C to 25°C (59°F to 77°F) for up to 30 days.

ReconstitutionI.V.

Induction or stimulation of labor: Add oxytocin 10 units to NS or LR 1000 mL to yield a solution containing oxytocin 10 milliunits/mL. Rotate solution to mix.

Postpartum uterine bleeding: Add oxytocin 10-40 units to running I.V. infusion; maximum: 40 units/1000 mL.

Adjunctive management of abortion: Add oxytocin 10 units to 500 mL of a physiologic saline solution or D_5W.

CompatibilityStable in dextran 6% in dextrose, dextran 6% in NS, D_5LR, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, D_5W, $D_{10}W$, LR, ${}^1/_2NS$, NS.

Y-site administration: Compatible: Heparin, hydrocortisone sodium succinate, insulin (regular), meperidine, morphine, potassium chloride, vitamin B complex with C, warfarin.

Compatibility when admixed: Compatible: Chloramphenicol, metaraminol, sodium bicarbonate, thiopental, verapamil. **Incompatible:** Fibrinolysin (human), norepinephrine, prochlorperazine edisylate, warfarin. **Variable (consult detailed reference):** Phytonadione.

ContraindicationsHypersensitivity to oxytocin or any component of the formulation; significant cephalopelvic disproportion; unfavorable fetal positions; fetal distress; hypertonic or hyperactive uterus; contraindicated vaginal delivery (invasive cervical cancer, active genital herpes, prolapse of the cord, cord presentation, total placenta previa, or vasa previa)

Warnings/Precautions

Boxed warnings:

- Appropriate use: See "Other warnings/precautions" below.

Concerns related to adverse effects:

- Antidiuretic effect: May produce antidiuretic effect (ie, water intoxication and excess uterine contractions).

- Uterine effects: High doses or hypersensitivity to oxytocin may cause uterine hypertonicity, spasm, tetanic contraction, or rupture of the uterus.

- Water intoxication: Severe water intoxication with convulsions, coma, and death is associated with a slow oxytocin infusion over 24 hours.

Other warnings/precautions:

- Appropriate use: **[U.S. Boxed Warning]: To be used for medical rather than elective induction of labor.**

Pregnancy Risk FactorX

Pregnancy Considerations**[U.S. Boxed Warning]: To be used for medical rather than elective induction of labor.** Reproduction studies have not been conducted. When used as indicated, teratogenic effects would not be expected. Nonteratogenic adverse reactions are reported in the neonate as well as the mother.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsEndogenous levels of oxytocin naturally increase during breast-feeding.

Adverse ReactionsFrequency not defined.

Fetus or neonate:

Cardiovascular: Arrhythmias (including premature ventricular contractions), bradycardia

Central nervous system: Brain or CNS damage (permanent), neonatal seizure

Hepatic: Neonatal jaundice

Ocular: Neonatal retinal hemorrhage

Miscellaneous: Fetal death, low Apgar score (5 minute)

Mother:

Cardiovascular: Arrhythmias, hypertensive episodes, premature ventricular contractions

Gastrointestinal: Nausea, vomiting

Genitourinary: Pelvic hematoma, postpartum hemorrhage, uterine hypertonicity, tetanic contraction of the uterus, uterine rupture, uterine spasm

Hematologic: Afibrinogenemia (fatal)

Miscellaneous: Anaphylactic reaction, subarachnoid hemorrhage

Drug Interactions

Dinoprostone: May enhance the therapeutic effect of Oxytocin. *Risk D: Consider therapy modification*

Misoprostol: May enhance the therapeutic effect of Oxytocin. *Risk D: Consider therapy modification*

Monitoring ParametersFluid intake and output during administration; fetal monitoring

Nursing: Physical Assessment/MonitoringMonitor blood pressure, fluid intake and output, and labor closely if using oxytocin for induction; fetal monitoring is strongly recommended. **Pregnancy risk factor X.**

Patient EducationI.V./I.M.: Generally used in emergency situations. Drug teaching should be incorporated in other situational teaching. **Pregnancy/breast-feeding precautions:** Consult prescriber if you suspect you might be pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Use caution if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 10 units/mL (1 mL, 10 mL, 30 mL)

Pitocin®: 10 units/mL (1 mL, 10 mL)

Generic AvailableYes

Mechanism of ActionProduces the rhythmic uterine contractions characteristic to delivery

Pharmacodynamics/Kinetics

Onset of action: Uterine contractions: I.M.: 3-5 minutes; I.V.: ~1 minute

Duration: I.M.: 2-3 hour; I.V.: 1 hour

Metabolism: Rapidly hepatic and via plasma (by oxytocinase) and to a smaller degree the mammary gland

Half-life elimination: 1-5 minutes

Excretion: Urine

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Paclitaxel (Protein Bound)

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Paclitaxel (protein bound) may be confused with paclitaxel (conventional)

Abraxane® may be confused with Paxil®, Taxol®, Taxotere®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(pac li TAKS el PROE teen bownd)

U.S. Brand NamesAbraxane®

Pharmacologic CategoryAntineoplastic Agent, Antimicrotubular; Antineoplastic Agent, Natural Source (Plant) Derivative; Antineoplastic Agent, Taxane Derivative

Use: Labeled IndicationsTreatment of relapsed or refractory breast cancer

Dosing: Adults**Breast cancer:** I.V.: 260 mg/m^2 every 3 weeks **or** alternate weekly schedule (unlabeled): 100-150 mg/m^2 on days 1, 8, and 15 of a 28-day cycle

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentSafety not established for serum creatinine >2 mg/dL; use with caution.

Dosing: Hepatic ImpairmentEffects of hepatic dysfunction (serum bilirubin >1.5 mg/dL) unknown; dosage adjustment recommendations are not available.

Dosing: Adjustment for Toxicity

Severe neutropenia (<500 cells/mm^3) ≥1 week: Reduce dose to 220 mg/m^2 for subsequent courses

Recurrent severe neutropenia: Reduce dose to 180 mg/m^2

Sensory neuropathy, grade 3: Hold treatment until resolved to grade 1 or 2, then resume with reduced dose

Severe sensory neuropathy: Reduce dose to 220 mg/m^2 for subsequent courses

Recurrent severe sensory neuropathy: Reduce dose to 180 mg/m^2

Calculations

- Body Surface Area: Adults

Administration: I.V.Administer over 30 minutes. Do not use an in-line filter. Avoid extravasation.

StorageStore intact vial at room temperature of 20°C to 25°C (68°F to 77°F) and protect from bright light. Reconstituted solution may be stored under refrigeration 2°C to 8°C (36°F to 46°F) for up to 8 hours. The solution for administration is stable for up to 8 hours at room temperature and ambient light.

ReconstitutionUse appropriate precautions for handling and disposal. Reconstitute vial with 20 mL NS to a concentration of 5 mg/mL. Add NS slowly, directing it along inside vial wall; allow vial to sit for 5 minutes, then gently swirl for 2 minutes; avoid foaming. Place dose without further dilution into an empty sterile container. **Note:** Use of DEHP-free containers or administration sets is not necessary. **Do not use an in-line filter.**

CompatibilityStable in NS. Formulation contains albumin; do not mix with other drugs.

ContraindicationsPatients with baseline neutrophils <1500/mm^3

Warnings/Precautions

Boxed warnings:

- Bone marrow suppression: See “Concerns related to adverse effects” below.
- Do not interchange: See “Other warnings/precautions” below.
- Experienced physician: See “Other warnings/precautions” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: **[U.S. Boxed Warning]: Baseline neutrophils should be ≥1500/mm^3 for administration;** neutrophils should recover to >1500/mm^3 and platelets should recover to >100,000/mm^3 prior to the next treatment cycle. Dose-dependent bone marrow suppression (primarily neutropenia) is the dose-limiting toxicity. For severe neutropenia, dose reductions may be recommended for subsequent cycles. When administered as sequential infusions, taxane derivatives (docetaxel, paclitaxel) should be administered before platinum derivatives (carboplatin, cisplatin) to limit myelosuppression.

- Hypersensitivity: Rare postmarketing cases of severe hypersensitivity have been reported; do not rechallenge after severe hypersensitivity reaction. Use has not been studied in patients with a prior hypersensitivity reaction to conventional paclitaxel or albumin.

- Neuropathy: Dose-related sensory neuropathy is common; severe sensory neuropathy may occur.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; not studied in patients with serum bilirubin >1.5 mg/dL.

- Renal impairment: Use with caution in patients with renal impairment; not studied in patients with serum creatinine >2 mg/dL.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Albumin: Product contains albumin, which confers a theoretical risk of transmission of viral disease or Creutzfeldt-Jakob disease.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

- Do not interchange: **[U.S. Boxed Warning]: Paclitaxel (protein-bound) is not interchangeable with other forms of paclitaxel, including Cremophor®-based or unbound paclitaxel.**

Pregnancy Risk FactorD

Pregnancy ConsiderationsTeratogenic effects and fetal mortality have been observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should be advised to avoid becoming pregnant during therapy. Additionally, testicular atrophy/degeneration was observed in animal studies; males should be advised to not father a child during therapy.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, the manufacturer recommends that nursing be discontinued during therapy.

Adverse Reactions

>10%:

Cardiovascular: ECG abnormal (60%)

Dermatologic: Alopecia (90%)

Gastrointestinal: Nausea (30%; grades 3/4: 3%), diarrhea (27%; grades 3/4: <1%), vomiting (18%; grades 3/4: 4%)

Hematologic: Neutropenia (80%; grade 4: 9%), anemia (33%; grades 3/4: 1%)

Hepatic: AST increased (39%), alkaline phosphatase increased (36%), GGT increased (grades 3/4: 14%)

Neuromuscular & skeletal: Sensory neuropathy (71%; grades 3/4: 10%; dose dependent; may be cumulative), weakness (47%), myalgia/arthralgia (44%)

Ocular: Vision disturbance (13%; severe [keratitis, blurred vision]: 1%)

Renal: Creatinine increased (11%; severe 1%)

Respiratory: Dyspnea (12%)

Miscellaneous: Infection (24%; primarily included oral candidiasis, respiratory tract infection, and pneumonia)

1% to 10%:

Cardiovascular: Edema (10%), hypotension (5%), cardiovascular events (grades 3/4: 3%; included chest pain, cardiac arrest, supraventricular tachycardia, edema, thrombosis, pulmonary thromboembolism, pulmonary emboli, and hypertension)

Gastrointestinal: Mucositis (7%; grades 3/4: <1%)

Hematologic: Bleeding (2%), neutropenic fever (2%), thrombocytopenia (2%; grades 3/4: <1%)

Hepatic: Bilirubin increased (7%)

Neuromuscular & skeletal: Peripheral neuropathy (grade 3: 10%)

Respiratory: Cough (7%)

Miscellaneous: Hypersensitivity reaction (4%, includes chest pain, dyspnea, flushing, hypotension; severe: <1%)

<1%, postmarketing, and/or case reports: Arrhythmia, bradycardia, cardiac ischemia, cerebrovascular attack, cranial nerve palsies, embolism, erythema, hand-foot syndrome (in patients previously exposed to capecitabine), injection site reaction, maculopapular rash, MI, motor neuropathy, nail discoloration, nail pigmentation changes, photosensitivity reaction, pneumothorax, pruritus, radiation recall, stroke, thrombosis, transient ischemic attack

Adverse reactions reported with paclitaxel, which may occur with paclitaxel (protein bound): Autonomic neuropathy, cellulitis, conjunctivitis, extravasation recall, hepatic encephalopathy, hepatic necrosis, induration, intestinal obstruction, intestinal perforation, interstitial pneumonia, ischemic colitis, lacrimation increased, lung fibrosis, neutropenic enterocolitis (typhlitis), optic nerve damage (persistent), pancreatitis, paralytic ileus, phlebitis, pulmonary embolism, radiation pneumonitis with concurrent radiation therapy, skin exfoliation, skin fibrosis, skin necrosis, Stevens-Johnson syndrome, toxic epidermal necrolysis

Oncology: VesicantNo
Oncology: Emetic PotentialLow (10% to 30%)
Metabolism/Transport Effects**Substrate** (major) of CYP2C8, 2C9, 3A4; **Induces** CYP3A4 (weak)
Drug Interactions

Antineoplastic Agents (Anthracycline): Taxane Derivatives may enhance the adverse/toxic effect of Antineoplastic Agents (Anthracycline). Taxane Derivatives may increase the serum concentration of Antineoplastic Agents (Anthracycline). Taxane Derivatives may also increase the formation of toxic anthracycline metabolites in heart tissue. *Risk D: Consider therapy modification*

Cardiac Glycosides: Antineoplastic Agents may decrease the absorption of Cardiac Glycosides. This may only affect digoxin tablets. **Exceptions:** Digitoxin. *Risk C: Monitor therapy*

CYP2C8 Inducers (Highly Effective): May increase the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C8 Inhibitors (Moderate): May decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C8 Inhibitors (Strong): May decrease the metabolism of CYP2C8 Substrates (High risk). *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

DOXOrubicin: Taxane Derivatives may decrease the metabolism of DOXOrubicin. *Risk D: Consider therapy modification*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Platinum Derivatives: May enhance the myelosuppressive effect of Taxane Derivatives. Administer Taxane derivative before Platinum derivative when given as sequential infusions to limit toxicity. *Risk D: Consider therapy modification*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vinorelbine: Paclitaxel (Protein Bound) may enhance the neurotoxic effect of Vinorelbine. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Antineoplastic Agents may enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid St John's wort (may decrease paclitaxel levels). Avoid echinacea. Avoid black cohosh, dong quai in estrogen-dependent tumors.
Monitoring ParametersCBC, BP (during infusion), baseline ECG; hepatic function; monitor infusion site
Nursing: Physical Assessment/MonitoringPaclitaxel (protein bound) is not interchangeable with paclitaxel. Taxane derivatives should be administered before platinum derivatives to limit myelosuppression. Assess potential for interactions with other pharmacological agents and herbal products patient may be taking (eg, risk of increased or decrease levels/effects of paclitaxel). See Administration for specific infusion directions. Evaluate results of laboratory adverse response prior to, during, and between each infusion (eg, cardiovascular abnormalities; sensory neuropathy [numbness, tingling, burning pain], myelosuppression [anemia, opportunistic infection], GI irritation [nausea, vomiting, mucositis, stomatitis]). Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsCBC, BP (during infusion); hepatic function

Patient EducationThis drug can only be administered by intravenous infusion; you will be monitored closely during and following infusions. Immediately report any burning, pain, or swelling at infusion site; any unusual chest pain or tightness, rapid heartbeat or palpitations; difficulty breathing; difficulty swallowing; nausea or vomiting; or other adverse symptoms during infusion. Do not take any new medications during therapy without consulting prescriber. You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations unless approved by prescriber). It is important that you maintain adequate nutrition and fluid intake (2-3 L/day of fluids, unless instructed to restrict fluid intake). May cause nausea or vomiting (small frequent meals, and frequent mouth care may help); mouth sores (sucking ice chip may be beneficial, use good mouth care with a soft toothbrush and waxed dental floss; if severe or infection occurs consult prescriber for appropriate treatment); diarrhea (buttermilk or yogurt may help); loss of hair (will grow back after therapy). Report chest pain, palpitations, swelling of extremities; difficult breathing; pain or decreased sensation in extremities; unusual sign of weakness, fatigue, lethargy, persistent gastrointestinal disturbances (nausea, vomiting, diarrhea); or other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Females should not get pregnant while taking this medication and males should not father a child while receiving treatment. This drug may cause fetal deformities or loss of pregnancy; consult prescriber for appropriate contraceptives. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Abraxane®: 100 mg [contains albumin (human)]

Generic AvailableNo

ManufacturerAbraxis Bioscience Inc

Mechanism of ActionPaclitaxel promotes microtubule assembly by enhancing the action of tubulin dimers, stabilizing existing microtubules, and inhibiting their disassembly, interfering with the late G_2 mitotic phase, and inhibiting cell replication. May also distort mitotic spindles, resulting in the breakage of chromosomes. Paclitaxel may also suppress cell proliferation and modulate immune response.

Pharmacodynamics/Kinetics

Distribution: V_d: 632 L/m^2

Protein binding: 89% to 98%

Metabolism: Hepatic via CYP3A4 (to minor metabolites) and 2C8 (primarily to 6-alpha-hydroxypaclitaxel)

Half-life elimination: Terminal: 27 hours

Excretion: Feces (20%); urine (4% as unchanged drug, <1% as metabolites)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Mucositis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentECG abnormalities are common; avoid use with ziprasidone, pimozide, thioridazine, and mesoridazine. GI side effects are common; concomitant use with SSRIs, lithium, or valproic acid may produce additive effects. Neutropenia is common; use caution with clozapine, carbamazepine, and valproic acid. Carbamazepine, phenobarbital, and phenytoin may reduce the effects of paclitaxel.

Oncology: Bone Marrow CommentsGlutamine may decrease mucositis.

Jump To Field (Select Field Name)

Pharmacologic Category[Chemotherapy Regimen, Breast Cancer]

Regimen UseBreast cancer

RegimenNOTE: Multiple variations are listed below.

Variation 1:

Paclitaxel: I.V.: 135 mg/m^2 day 1

[total dose/cycle = 135 mg/m^2]

Vinorelbine: I.V.: 30 mg/m^2 day 1

[total dose/cycle = 30 mg/m^2]

Repeat cycle every 21 days

Variation 2:

Paclitaxel: I.V.: 150 mg/m^2 day 1

[total dose/cycle = 150 mg/m^2]

Vinorelbine: I.V.: 25 mg/m^2 day 1

[total dose/cycle = 25 mg/m^2]

Repeat cycle every 21 days

Variation 3:

Paclitaxel: I.V.: 135 mg/m^2 day 1

[total dose/cycle = 135 mg/m^2]

Vinorelbine: I.V.: 30 mg/m^2/day days 1 and 8

[total dose/cycle = 60 mg/m^2]

Repeat cycle every 28 days

Paclitaxel

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Paclitaxel may be confused with paroxetine, Paxil®

Paclitaxel (conventional) may be confused with paclitaxel (protein-bound)

Taxol® may be confused with Abraxane®, Paxil®, Taxotere®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(pac li TAKS el)

U.S. Brand NamesOnxol® ; Taxol®

Canadian Brand NamesAbraxane® For Injectable Suspension; Apo-Paclitaxel®; Taxol®

Pharmacologic CategoryAntineoplastic Agent, Antimicrotubular; Antineoplastic Agent, Natural Source (Plant) Derivative; Antineoplastic Agent, Taxane Derivative

Use: Labeled IndicationsTreatment of breast, nonsmall cell lung, and ovarian cancers; treatment of AIDS-related Kaposi's sarcoma (KS)

Use: Unlabeled/InvestigationalTreatment of bladder, cervical, prostate, small cell lung, and head and neck cancers; treatment of (unknown primary) adenocarcinoma

Dosing: Adults**Note:** Premedication with dexamethasone (20 mg orally or I.V. at 12 and 6 hours **or** 14 and 7 hours before the dose; reduce dexamethasone dose to 10 mg orally with advanced HIV disease), diphenhydramine (50 mg I.V. 30-60 minutes prior to the dose), and cimetidine, famotidine, or ranitidine (I.V. 30-60 minutes prior to the dose) is recommended.

Ovarian carcinoma:

I.V.: 135-175 mg/m^2 over 3 hours every 3 weeks **or**

135 mg/m^2 over 24 hours every 3 weeks **or**

50-80 mg/m^2 over 1-3 hours weekly **or**

1.4-4 mg/m^2/day continuous infusion for 14 days every 4 weeks

Intraperitoneal (unlabeled route): 60 mg/m^2 on day 8 of a 21-day treatment cycle for 6 cycles, in combination with I.V. paclitaxel and intraperitoneal cisplatin. **Note:** Administration of intraperitoneal paclitaxel should include the standard paclitaxel premedication regimen.

Metastatic breast cancer: I.V.: 175-250 mg/m^2 over 3 hours every 3 weeks **or**

50-80 mg/m^2 weekly **or**

1.4-4 mg/m^2/day continuous infusion for 14 days every 4 weeks

Nonsmall cell lung carcinoma: I.V.: 135 mg/m^2 over 24 hours every 3 weeks

AIDS-related Kaposi's sarcoma: I.V.: 135 mg/m^2 over 3 hours every 3 weeks

or 100 mg/m^2 over 3 hours every 2 weeks

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentThere are no FDA-approved labeling guidelines for dosage adjustment in patients with renal impairment. Arnoff (2007) recommends no dosage adjustment necessary for adults with Cl_{cr} <50 mL/minute.

Dosing: Hepatic Impairment**Note:** The FDA-approved labeling recommendations are based upon the patient's first course of therapy where the usual dose would be 135 mg/m^2 dose over 24 hours or the 175 mg/m^2 dose over 3 hours in patients with normal hepatic function. Dosage in subsequent courses should be based upon individual tolerance. Adjustments for other regimens are not available.

24-hour infusion:

Transaminases <2 times upper limit of normal (ULN) and bilirubin level ≤1.5 mg/dL: 135 mg/m^2

Transaminases 2-<10 times ULN and bilirubin level ≤1.5 mg/dL: 100 mg/m^2

Transaminases <10 times ULN and bilirubin level 1.6-7.5 mg/dL: 50 mg/m^2

Transaminases ≥10 times ULN or bilirubin level >7.5 mg/dL: Avoid use

3-hour infusion:

Transaminases <10 times ULN and bilirubin level ≤1.25 times ULN: 175 mg/m^2

Transaminases <10 times ULN and bilirubin level 1.26-2 times ULN: 135 mg/m^2

Transaminases <10 times ULN and bilirubin level 2.01-5 times ULN: 90 mg/m^2

Transaminases ≥10 times ULN or bilirubin level >5 times ULN: Avoid use

Dosing: Adjustment for Toxicity

Dosage modification for toxicity (solid tumors, including ovary, breast, and lung carcinoma): Courses of paclitaxel should not be repeated until the neutrophil count is ≥1500 cells/mm^3 and the platelet count is ≥100,000 cells/mm^3; reduce dosage by 20% for patients experiencing severe peripheral neuropathy or severe neutropenia (neutrophil <500 cells/mm^3 for a week or longer)

Dosage modification for immunosuppression in advanced HIV disease: Paclitaxel should not be given to patients with HIV if the baseline or subsequent neutrophil count is <1000 cells/mm^3. Additional modifications include: Reduce dosage of dexamethasone in premedication to 10 mg orally; reduce dosage by 20% in patients experiencing severe peripheral neuropathy or severe neutropenia (neutrophil <500 cells/mm^3 for a week or longer); initiate concurrent hematopoietic growth factor (G-CSF) as clinically indicated

Dosing: Combination Regimens

Adenocarcinoma, unknown primary:

Carbo-Tax (Adenocarcinoma)

Paclitaxel-Carboplatin-Etoposide

PCE

Bladder cancer:

Paclitaxel-Carboplatin (Bladder Cancer)

Paclitaxel-Carboplatin-Gemcitabine

Paclitaxel-Gemcitabine

Breast cancer:

AC/Paclitaxel (Sequential)

AC-Paclitaxel-Trastuzumab

ICE-T

Paclitaxel-Bevacizumab

Paclitaxel-Vinorelbine

Trastuzumab-Paclitaxel

Trastuzumab-Paclitaxel-Carboplatin

Trastuzumab-Paclitaxel (Weekly)

Cervical cancer:

Paclitaxel-Cisplatin (Cervical Cancer)

Esophageal cancer:

Paclitaxel-Cisplatin-Fluorouracil (Esophageal Cancer)

TIP

Head and neck cancer:

FU HURT

Paclitaxel-Cetuximab

TIP

Lung cancer (nonsmall cell):

Carbo-Tax (NSCLC)

CaT (NSCLC)

Paclitaxel-Carboplatin-Bevacizumab

PC (NSCLC)

Ovarian cancer:

Carbo-Tax (Ovarian Cancer)

CaT (Ovarian Cancer)

Cisplatin-Paclitaxel (Intraperitoneal Regimen)

CT

Gemcitabine-Paclitaxel

Prostate cancer:

Estramustine-Paclitaxel

Paclitaxel + Estramustine + Carboplatin

Paclitaxel + Estramustine + Etoposide

Sarcoma, soft tissue: ICE-T

Testicular cancer: Paclitaxel-Ifosfamide-Cisplatin

Oncology: Bone Marrow - High DoseI.V.: 250-775 mg/m^2; generally combined with other high-dose chemotherapy; maximum dose as single agent: 825 mg/m^2

Calculations

- Body Surface Area: Adults

Administration: I.V.Infuse over 1-96 hours. When administered as sequential infusions, taxane derivatives should be administered before platinum derivatives (cisplatin, carboplatin) to limit myelosuppression and to enhance efficacy.

Premedication with dexamethasone (20 mg orally or I.V. at 12 and 6 hours **or** 14 and 7 hours before the dose; reduce to 10 mg with advanced HIV disease), diphenhydramine (50 mg I.V. 30-60 minutes prior to the dose), and cimetidine 300 mg, famotidine 20 mg, or ranitidine 50 mg (I.V. 30-60 minutes prior to the dose) is recommended.

Administer I.V. infusion over 1-24 hours; infuse through a 0.22 micron in-line filter and nonsorbing administration set.

Administration: I.V. DetailpH: 4.4-5.6

Administration: OtherIntraperitoneal: 1-2 hour infusion

StorageStore intact vials at room temperature of 20°C to 25°C (68°F to 77°F). Protect from light. Solutions in D_5W and NS are stable for up to 3 days at room temperature (25°C).

Paclitaxel should be dispensed in either glass or non-PVC containers (eg, Excel™/PAB™). Use **nonpolyvinyl** (non-PVC) tubing (eg, polyethylene) to minimize leaching. Formulated in a vehicle known as Cremophor® EL (polyoxyethylated castor oil). Cremophor® EL has been found to leach the plasticizer DEHP from polyvinyl chloride infusion bags or administration sets. Contact of the undiluted concentrate with plasticized polyvinyl chloride (PVC) equipment or devices is not recommended.

ReconstitutionDilute in 250-1000 mL D_5W, D_5LR, D_5NS, or NS to a concentration of 0.3-1.2 mg/mL. Chemotherapy dispensing devices (eg, Chemo Dispensing Pin™) should not be used to withdraw paclitaxel from the vial.

CompatibilityStable in D_5W, D_5LR, D_5NS, NS.

Y-site administration: Compatible: Acyclovir, amikacin, aminophylline, ampicillin/sulbactam, bleomycin, butorphanol, calcium chloride, carboplatin, cefepime, cefotetan, ceftazidime, ceftriaxone, cimetidine, cisplatin, cladribine, cyclophosphamide, cytarabine, dacarbazine, dexamethasone sodium phosphate, diphenhydramine, doxorubicin, droperidol, etoposide, etoposide phosphate, famotidine, floxuridine, fluconazole, fluorouracil, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone sodium phosphate, hydrocortisone sodium succinate, hydromorphone, ifosfamide, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, mesna, methotrexate, metoclopramide, morphine, nalbuphine, ondansetron, ondansetron with ranitidine, pentostatin, potassium chloride, prochlorperazine edisylate, propofol, ranitidine, sodium bicarbonate, thiotepa, topotecan, vancomycin, vinblastine, vincristine, zidovudine. **Incompatible:** Amphotericin B, amphotericin B cholesteryl sulfate complex, chlorpromazine, doxorubicin liposome, hydroxyzine, methylprednisolone sodium succinate, mitoxantrone.

Compatibility when admixed: Compatible: Carboplatin, doxorubicin. **Variable (consult detailed reference):** Cisplatin.

ContraindicationsHypersensitivity to paclitaxel, Cremophor® EL (polyoxyethylated castor oil), or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Bone marrow suppression: See “Concerns related to adverse effects” below.

- Experienced physician: See “Other warnings/precautions” below.

- Hypersensitivity reactions: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: **[U.S. Boxed Warning]: Bone marrow suppression is the dose-limiting toxicity; do not administer if baseline absolute neutrophil count (ANC) is <1500 cells/mm^3 (<1000 cells/mm^3 for patients with AIDS-related KS);** reduce future doses by 20% for severe neutropenia (<500 cells/mm^3 for 7 days or more) and consider the use of supportive therapy, including growth factor treatment. When administered as sequential infusions, taxane derivatives (docetaxel, paclitaxel) should be administered before platinum derivatives (carboplatin, cisplatin) to limit myelosuppression.

- Cardiovascular effects: Infusion-related hypotension, bradycardia, and/or hypertension may occur; frequent monitoring of vital signs is recommended, especially during the first hour of the infusion. Rare but severe conduction abnormalities have been reported; conduct cardiac monitoring during subsequent infusions for these patients.

- Hypersensitivity reactions: **[U.S. Boxed Warning]: Severe hypersensitivity reactions have been reported;** premedication may minimize this effect. Stop infusion and do not rechallenge for severe hypersensitivity reactions (hypotension requiring treatment, dyspnea requiring bronchodilators, angioedema, urticaria). Minor hypersensitivity reactions (flushing, skin reactions, dyspnea, hypotension, or tachycardia) do not require interruption of treatment.

- Peripheral neuropathy: With use, peripheral neuropathy may occur; patients with pre-existing neuropathies from chemotherapy or coexisting conditions (eg, diabetes mellitus) may be at a higher risk; reduce dose by 20% for severe neuropathy.

Disease-related concerns:

- Hepatic impairment: Use with extreme caution in patients with hepatic dysfunction (myelotoxicity may be worsened); dose reductions are recommended.

Special populations:

- Elderly: Use with caution in the elderly; increased risk of toxicity (neutropenia, neuropathy).

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Dehydrated alcohol: Formulations contain dehydrated alcohol; may cause adverse CNS effects.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

Geriatric ConsiderationsElderly patients may have a higher incidence of severe neuropathy, severe myelosuppression, or cardiovascular events as compared to younger patients.

Pregnancy Risk FactorD

Pregnancy ConsiderationsAnimal studies have demonstrated embryotoxicity, fetal toxicity, and maternal toxicity. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should be advised to avoid becoming pregnant.

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions, breast-feeding is contraindicated.

Adverse ReactionsPercentages reported with single-agent therapy. **Note:** Myelosuppression is dose related, schedule related, and infusion-rate dependent (increased incidences with higher doses, more frequent doses, and longer infusion times) and, in general, rapidly reversible upon discontinuation.

>10%:

Cardiovascular: Flushing (28%), ECG abnormal (14% to 23%), edema (21%), hypotension (4% to 12%)

Dermatologic: Alopecia (87%), rash (12%)

Gastrointestinal: Nausea/vomiting (52%), diarrhea (38%), mucositis (17% to 35%; grades 3/4: up to 3%), stomatitis (15%; most common at doses >390 mg/m^2), abdominal pain (with intraperitoneal paclitaxel)

Hematologic: Neutropenia (78% to 98%; grade 4: 14% to 75%; onset 8-10 days, median nadir 11 days, recovery 15-21 days), leukopenia (90%; grade 4: 17%), anemia (47% to 90%; grades 3/4: 2% to 16%), thrombocytopenia (4% to 20%; grades 3/4: 1% to 7%), bleeding (14%)

Hepatic: Alkaline phosphatase increased (22%), AST increased (19%)

Local: Injection site reaction (erythema, tenderness, skin discoloration, swelling: 13%)

Neuromuscular & skeletal: Peripheral neuropathy (42% to 70%; grades 3/4: up to 7%), arthralgia/myalgia (60%), weakness (17%)

Renal: Creatinine increased (observed in KS patients only: 18% to 34%; severe: 5% to 7%)

Miscellaneous: Hypersensitivity reaction (31% to 45%; grades 3/4: up to 2%), infection (15% to 30%)

1% to 10%:

Cardiovascular: Bradycardia (3%), tachycardia (2%), hypertension (1%), rhythm abnormalities (1%), syncope (1%), venous thrombosis (1%)

Dermatologic: Nail changes (2%)

Hematologic: Febrile neutropenia (2%)

Hepatic: Bilirubin increased (7%)

Respiratory: Dyspnea (2%)

<1%, postmarketing, and/or case reports: Anaphylaxis, ataxia, atrial fibrillation, AV block, back pain, cardiac conduction abnormalities, cellulitis, CHF, chills, conjunctivitis, dehydration, enterocolitis, extravasation recall, hepatic encephalopathy, hepatic necrosis, induration, intestinal obstruction, intestinal perforation, interstitial pneumonia, ischemic colitis, lacrimation increased, maculopapular rash, malaise, MI, necrotic changes and ulceration following extravasation, neuroencephalopathy, neutropenic enterocolitis, ototoxicity (tinnitus and hearing loss), pancreatitis, paralytic ileus, phlebitis, pruritus, pulmonary embolism, pulmonary fibrosis, radiation recall, radiation pneumonitis, pruritus, renal insufficiency, seizure, skin exfoliation, skin fibrosis, skin necrosis, Stevens-Johnson syndrome, supraventricular tachycardia, toxic epidermal necrolysis, ventricular tachycardia (asymptomatic), visual disturbances (scintillating scotomata)

Oncology: VesicantNo; the drug is an irritant. See Management of Drug Extravasations.
Oncology: Emetic PotentialLow (10% to 30%)
Metabolism/Transport Effects**Substrate** (major) of CYP2C8, 3A4; **Induces** CYP3A4 (weak)
Drug Interactions

Antineoplastic Agents (Anthracycline): Taxane Derivatives may enhance the adverse/toxic effect of Antineoplastic Agents (Anthracycline). Taxane Derivatives may increase the serum concentration of Antineoplastic Agents (Anthracycline). Taxane Derivatives may also increase the formation of toxic anthracycline metabolites in heart tissue. *Risk D: Consider therapy modification*

CYP2C8 Inducers (Highly Effective): May increase the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C8 Inhibitors (Moderate): May decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C8 Inhibitors (Strong): May decrease the metabolism of CYP2C8 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

DOXOrubicin: Taxane Derivatives may decrease the metabolism of DOXOrubicin. *Risk D: Consider therapy modification*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Platinum Derivatives: May enhance the myelosuppressive effect of Taxane Derivatives. Administer Taxane derivative before Platinum derivative when given as sequential infusions to limit toxicity. *Risk D: Consider therapy modification*

Trastuzumab: May decrease the serum concentration of Paclitaxel. Paclitaxel may increase the serum concentration of Trastuzumab. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vinorelbine: Paclitaxel may enhance the neurotoxic effect of Vinorelbine. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid black cohosh, dong quai in estrogen-dependent tumors. Avoid valerian, St John's wort (may decrease paclitaxel levels), kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersCBC with differential; monitor for hypersensitivity reactions, vital signs (frequently during the first hour of infusion), continuous cardiac monitoring (patients with conduction abnormalities)

Reference RangeMean maximum serum concentrations: 435-802 ng/mL following 24-hour infusions of 200-275 mg/m^2 and were approximately 10% to 30% of those following 6-hour infusions of equivalent doses

Nursing: Physical Assessment/MonitoringShould only be administered under the supervision of an experienced cancer chemotherapy physician. Paclitaxel (protein bound) is not interchangeable with paclitaxel (conventional). Assess patient carefully for cautious use indications and contraindications. Assess potential for interactions with other pharmacological agents and herbal products patient may be taking (eg, risk of increased or decreased levels/effects of paclitaxel). See Administration for specific infusion directions. Infusion site must be monitored closely to avoid extravasation. Evaluate results of laboratory tests and adverse response prior to, during, and between each infusion (eg, hypersensitivity reaction, cardiovascular abnormalities, sensory neuropathy, myelosuppression, GI irritation). Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential and platelet count, liver and kidney function

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This drug can only be given by infusion. Report immediately any redness, swelling, burning, pain at infusion site or signs of allergic reaction (eg, respiratory difficulty or swallowing, chest tightness, rash, hives, swelling of lips or mouth). Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake, and nutrition. You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause loss of hair (will grow back after therapy); experience nausea or vomiting (consult prescriber for approved antiemetic); feel weak or lethargic (use caution when driving or engaging in tasks that require alertness until response to drug is known); or mouth sores (sucking ice chips may help; use good oral care with soft toothbrush and waxed dental floss; consult prescriber if severe or infection developes). Report numbness or tingling in fingers or toes (use care to prevent injury); signs of opportunistic infection (fever, chills, sore throat, burning urination, fatigue); unusual bleeding (tarry stools, easy bruising, or blood in stool, urine, or mouth); unresolved mouth sores; nausea or vomiting; or skin rash or itching. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication. Consult prescriber for appropriate barrier contraceptive measures. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 6 mg/mL (5 mL, 16.7 mL, 25 mL, 50 mL) [contains ethanol and purified Cremophor® EL (polyoxyethylated castor oil)]

Onxol® : 6 mg/mL (5 mL, 25 mL, 50 mL) [contains ethanol and purified Cremophor® EL (polyoxyethylated castor oil)]

Taxol®: 6 mg/mL (5 mL [DSC], 16.7 mL, 50 mL) [contains ethanol and purified Cremophor® EL (polyoxyethylated castor oil)]

Generic AvailableYes

Mechanism of ActionPaclitaxel promotes microtubule assembly by enhancing the action of tubulin dimers, stabilizing existing microtubules, and inhibiting their disassembly, interfering with the late G_2 mitotic phase, and inhibiting cell replication. In addition, the drug can distort mitotic spindles, resulting in the breakage of chromosomes. Paclitaxel may also suppress cell proliferation and modulate immune response.

Pharmacodynamics/Kinetics

Distribution:

V_d: Widely distributed into body fluids and tissues; affected by dose and duration of infusion

V_{dss}:

1- to 6-hour infusion: 67.1 L/m^2

24-hour infusion: 227-688 L/m^2

Protein binding: 89% to 98%

Metabolism: Hepatic via CYP2C8 and 3A4; forms metabolites (primarily 6α-hydroxypaclitaxel)

Half-life elimination:

1- to 6-hour infusion: Mean (beta): 6.4 hours

3-hour infusion: Mean (terminal): 13.1-20.2 hours

24-hour infusion: Mean (terminal): 15.7-52.7 hours

Excretion: Feces (~70%, 5% as unchanged drug); urine (14%)

Clearance: Mean: Total body: After 1- and 6-hour infusions: 5.8-16.3 L/hour/m^2; After 24-hour infusions: 14.2-17.2 L/hour/m^2

Related Information

- Safe Handling of Hazardous Drugs

Pharmacotherapy PearlsSensory neuropathy is almost universal at doses >250 mg/m^2; motor neuropathy is uncommon at doses <250 mg/m^2. Myopathic effects are common with doses >200 mg/m^2, generally occur within 2-3 days of treatment, and resolve over 5-6 days. Intraperitoneal administration of paclitaxel is associated with a higher incidence of chemotherapy related toxicity.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Severe, potentially dose-limiting mucositis and stomatitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMay cause neutropenia; use caution with clozapine and carbamazepine

Oncology: Bone Marrow CommentsGlutamine may decrease mucositis

Palifermin

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(pal ee FER min)
U.S. Brand NamesKepivance®
Pharmacologic CategoryKeratinocyte Growth Factor
Use: Labeled IndicationsDecrease the incidence and severity of severe oral mucositis associated with hematologic malignancies in patients receiving myelotoxic therapy requiring hematopoietic stem cell support
Use: DentalDecrease the incidence and severity of severe oral mucositis associated with hematologic malignancies in patients receiving myelotoxic therapy requiring hematopoietic stem cell support
Dosing: Adults**Oral mucositis:** I.V.: 60 mcg/kg/day for 3 consecutive days before and after myelotoxic therapy; total of 6 doses

Note: Administer first 3 doses prior to myelotoxic therapy, with the 3rd dose given 24-48 hours before therapy begins. The last 3 doses should be administered after myelotoxic therapy, with the first of these doses after but on the same day as hematopoietic stem cell infusion and at least 4 days after the most recent dose of palifermin.

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentNo adjustment necessary.
Administration: I.V.Administer by I.V. bolus. If heparin is used to maintain the patency of the I.V. line, flush line with saline prior to and after palifermin administration. Do not administer palifermin during or within 24 hours before or after chemotherapy. Allow solution to reach room temperature prior to administration; do not use if at room temperature >1 hour. Do not filter.
Administration: I.V. DetailpH 6.5
StorageStore intact vials under refrigeration at 2°C to 8°C (36°F to 46°F). Protect from light. Reconstituted vials are stable for up to 72 hours refrigerated and should not be used if left at room temperature >2 hours (data on file). The product labeling, however, indicates that reconstituted vials are stable for up to 24 hours refrigerated and should not be used if left at room temperature >1 hour. Protect reconstituted solution from light. Do not freeze reconstituted product.
ReconstitutionTo reconstitute, slowly add 1.2 mL SWFI, to a final concentration of 5 mg/mL. Swirl gently; do not shake or vigorously agitate. Do not filter during preparation or administration.
Compatibility**Incompatible:** Heparin.
ContraindicationsHypersensitivity to palifermin, *E. coli*-derived proteins, or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Mucocutaneous effects: Edema, erythema, pruritus, rash, oral/perioral dysesthesia, taste alteration, tongue discoloration, and tongue thickening may occur; instruct patients to report mucocutaneous effects.
- Mucositis: If administered within 24 hours of chemotherapy, palifermin may increase the severity and duration of mucositis due to the increased sensitivity of rapidly-dividing epithelial cells. Palifermin should be administered prior to and following, but not during or within 24 hours of (before or after) chemotherapy.

Disease-related concerns:

- Nonhematologic malignancies: Safety and efficacy have not been established with nonhematologic malignancies; effect on the growth of nonhematopoietic human tumors is not known.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Tumor growth: Palifermin has been shown to enhance epithelial tumor cell lines *in vitro*.

Pregnancy Risk FactorC
Pregnancy ConsiderationsPalifermin has been shown to be embryotoxic in animal studies at doses also associated with maternal toxicity. There are no adequate and well-controlled studies in pregnant women.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

>10%:

Cardiovascular: Edema (28%), hypertension (7% to 14%)

Central nervous system: Fever (39%); pain (16%); dysesthesia (oral hyperesthesia, hypoesthesia, and paresthesia 12%)

Dermatologic: Rash (62%; grade 3: 3%), pruritus (35%), erythema (32%)

Gastrointestinal: Serum amylase increased (grades 3/4: 38%), mouth/tongue discoloration or thickness (17%), taste alteration (16%), serum lipase increased (grades 3/4: 11%)

Renal: Proteinuria (17%)

Respiratory: Cough (32%), rhinitis (16%)

1% to 10%:

Neuromuscular & skeletal: Arthralgia (10%)

Miscellaneous: Antibody formation (2%)

<1%, postmarketing, and/or case reports: Flexural hyperpigmentation

Drug InteractionsThere are no known significant interactions.

Nursing: Physical Assessment/MonitoringTeach patient/caregiver reason for use, possible side effects, appropriate interventions, adverse symptoms to report, and pregnancy precautions (see Patient Education).

Patient EducationThis drug can only be administered by intravenous infusion; you will be monitored during and after infusion. Report any pain, redness, or swelling at infusion site. This drug may help reduce the incidence of mouth sores; however, good mouth care with soft swabs and nonirritating mouth wash is very important. May cause some mouth/tongue discoloration or thickness and some taste alteration (frequent mouth care or sucking lozenges may help). Report any swelling or loss of sensation in extremities; usual joint or muscle pain; fever; skin rash or redness; or other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant or breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [preservative free]:

Kepivance®: 6.25 mg [contains mannitol 50 mg, sucrose 25 mg]

Generic AvailableNo

ManufacturerAmgen Inc

Mechanism of ActionPalifermin is a recombinant keratinocyte growth factor (KGF) produced in *E. coli*. Endogenous KGF is produced by mesenchymal cells in response to epithelial tissue injury. KGF binds to the KGF receptor resulting in proliferation, differentiation and migration of epithelial cells in multiple tissues, including (but not limited to) the tongue, buccal mucosa, esophagus, and salivary gland.

Pharmacodynamics/Kinetics

Onset of action: Epithelial cell proliferation (dose-dependent): 48 hours

Half-life elimination: 4.5 hours (range: 3.3-5.7 hours)

Pharmacotherapy Pearls**Oncology Comment:** The Multinational Association of Supportive Care in Cancer and the International Society for Oral Oncology (MASCC/ISOO) guidelines for the prevention and treatment of mucositis recommend palifermin (at the FDA-approved dose) for the prevention of oral mucositis in patients with hematologic malignancies who are receiving high-dose chemotherapy and total body irradiation with autologous stem cell transplantation (Keefe, 2007).

Guidelines from the American Society of Clinical Oncology (ASCO) for the use of chemotherapy and radiotherapy protectants (Hensley, 2008) recommend the use of palifermin to decrease the incidence of severe mucositis in patients undergoing autologous stem-cell transplantation with a total body irradiation (TBI) conditioning regimen. According to the ASCO guidelines, data are insufficient to recommend palifermin when the conditioning regimen is chemotherapy only. Palifermin may be considered in patients undergoing myeloablative allogeneic stem-cell transplantation with a TBI conditioning regimen, however data are again insufficient to recommend palifermin when the conditioning regimen is chemotherapy only. Due to a lack of appropriate data, the guidelines also do not recommend palifermin use in non-stem-cell transplantation treatment regimens or for use when treating solid tumors.

Dental Health Professional ConsiderationsPalifermin works at the cellular level by protecting the epithelial cells lining the mouth and throat from damage caused by chemotherapy and radiation and by stimulating the growth and development of new epithelial cells to build up the mucosal barrier.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Taste alteration, mouth/tongue discoloration or thickness. See Dental Comment.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentEdema is common; rule out lithium as a cause. Rash is common; monitor, especially if receiving lamotrigine.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Antipsychotics (Conventional and Atypical): Association With an Increased Risk of Mortality in Elderly Patients Treated for Dementia-Related Psychosis - June 2008

The Food and Drug Administration (FDA) is notifying healthcare professionals that conventional antipsychotics (eg, haloperidol, fluphenazine) will now carry a similar boxed warning as atypical antipsychotics (eg, risperidone, aripiprazole) concerning an increased risk of mortality in elderly patients treated for dementia-related psychosis. Atypical antipsychotics received the boxed warning in April 2005 after study data from seven placebo-controlled trials indicated an increased risk of death in patients treated with certain atypicals for dementia-related behavioral disorders.

The FDA requirement to extend the warning to conventional antipsychotics was prompted by two recently published observational studies. Both studies revealed an increased risk of mortality in elderly patients treated with these medications. One of the two studies was a retrospective cohort study which examined 37,241 patients, ≥65 years of age, treated with antipsychotics. Of these patients, 12,882 received a conventional antipsychotic compared to 24,359 patients who received an atypical antipsychotic. All-cause mortality within the first 180 days of use was compared between the two groups. The results showed that the risk of death in patients who received a conventional-type antipsychotic was comparable to (and may be greater than) the risk of death in patients receiving an atypical. The second study was also a retrospective cohort study; it involved 27,259 matched pairs of patients, ≥66 years of age, diagnosed with dementia. Risk of death was compared in patients who received an atypical antipsychotic versus no antipsychotic, and in patients who received a conventional antipsychotic versus an atypical antipsychotic. An increased risk of death was observed in the groups receiving an atypical antipsychotic compared to no antipsychotic and also in patients receiving a conventional antipsychotic compared to patients receiving an atypical antipsychotic. This effect was seen at 30 days and persisted at 180 days, and was seen in both community-dwelling and long-term care facility patients.

The FDA believes that considering all the available evidence, conventional antipsychotics at least share a similar increased risk of death that has been observed with the use of atypical antipsychotics in elderly patients with dementia-related psychosis. The FDA is reminding practitioners that antipsychotic medications are not approved for the treatment of dementia-related psychosis. Elderly patients treated with antipsychotics, conventional or atypical, are at an increased risk of death. Practitioners prescribing antipsychotics to elderly patients for this purpose should inform the patient and their caregivers of this risk prior to prescribing.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antipsychotics

Pronunciation(pal ee PER i done)

U.S. Brand NamesInvega®

Canadian Brand NamesInvega®

Pharmacologic CategoryAntipsychotic Agent, Atypical

Use: Labeled IndicationsTreatment of schizophrenia

Use: Unlabeled/InvestigationalPsychosis/agitation related to Alzheimer's dementia

Dosing: Adults**Schizophrenia:** Oral: Usual: 6 mg once daily in the morning; titration not required, though some may benefit from higher or lower doses. If exceeding 6 mg/day, increases of 3 mg/day are recommended no more frequently than every 5 days, up to a maximum of 12 mg/day. Some patients may require only 3 mg/day.

Dosing: ElderlyRefer to adult dosing. Additional monitoring of renal function and orthostatic blood pressure may be warranted.

Dosing: Renal Impairment

Mild impairment (Cl_{cr} 50 to <80 mL/minute): Initial: 3 mg once daily; may increase to maximal dose of 6 mg/day if needed

Moderate-to-severe impairment (Cl_{cr} 10-49 mL/minute): Initial: 1.5 mg once daily; may increase to maximal dose of 3 mg/day if needed

Severe impairment (Cl_{cr} <10 mL/minute): Has not been studies; not recommended

Dosing: Hepatic ImpairmentNo adjustment necessary for mild-to-moderate (Child-Pugh class A and B) impairment. Not studied in severe impairment.

Calculations

- Creatinine Clearance: Adults

Administration: OralMay be administered with or without food. Extended release tablets should be swallowed whole with liquids; do not crush, chew, or divide.

Dietary ConsiderationsMay be taken with or without food.

StorageStore at controlled room temperature of ≤25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from moisture.

ContraindicationsHypersensitivity to paliperidone, risperidone, or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Dementia: See “Disease-related concerns” below.

Concerns related to adverse effects:

- Altered cardiac conduction: May alter cardiac conduction and prolong the QT_c interval; life-threatening arrhythmias have occurred with therapeutic doses of antipsychotics. Risk may be increased by conditions or concomitant medications which cause bradycardia, hypokalemia, and/or hypomagnesemia. Avoid use in combination with QT_c-prolonging drugs. Avoid use in patients with congenital long-QT syndrome and in patients with history of cardiac arrhythmia.

- Esophageal dysmotility/aspiration: Antipsychotic use has been associated with esophageal dysmotility and aspiration; use with caution in patients at risk of pneumonia (eg, Alzheimer's disease). Do not use in patients unable to swallow the tablet whole.

- Extrapyramidal symptoms: May cause extrapyramidal symptoms (EPS), including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia (risk of these reactions is generally much lower relative to typical/conventional antipsychotics). Risk of tardive dyskinesia may be increased in the elderly, particularly women. Symptoms may be masked by antipsychotic treatment. Risk of dystonia (and probably other EPS) may be greater with increased doses, use of conventional antipsychotics, males, and younger patients.

- Hyperglycemia: Atypical antipsychotics have been associated with development of hyperglycemia; in some cases, may be extreme and associated with ketoacidosis, hyperosmolar coma, or death. Use with caution in patients with diabetes (or risk factors) or other disorders of glucose regulation; monitor for worsening of glucose control.

- Neuroleptic malignant syndrome (NMS): Use may be associated with NMS; monitor for mental status changes, fever, muscle rigidity, and/or autonomic instability (risk may be increased in patients with Parkinson's disease or Lewy body dementia).

- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Sedation: May be low to moderately sedating, use with caution in disorders where CNS depression is a feature; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Suicidal ideation: The possibility of a suicide attempt is inherent in psychotic illness or bipolar disorder; use with caution in high-risk patients during initiation of therapy. Prescriptions should be written for the smallest quantity consistent with good patient care.

- Temperature regulation: Impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.

- Weight gain: Significant weight gain has been observed with antipsychotic therapy; incidence varies with product. Monitor waist circumference and BMI.

Disease-related concerns:

- Dementia: **[U.S. Boxed Warning]: Elderly patients with dementia-related psychosis treated with atypical antipsychotics are at an increased risk of death compared to placebo.** An increased incidence of cerebrovascular adverse events (including fatalities) has been reported in elderly patients with dementia-related psychosis. Paliperidone has not been studied in this clinical population and is not approved for the treatment of dementia-related psychosis.

- Gastrointestinal disorders: Use is not recommended in patients with pre-existing severe gastrointestinal narrowing disorders. Patients with upper GI tract alterations in transit time may have increased or decreased bioavailability of paliperidone.

- Parkinson's disease: Use with caution in patients with Parkinson's disease; they may be more sensitive to adverse effects.

- Prolactin-dependent tumors: Use with caution in patients with breast cancer or other prolactin-dependent tumors (elevates prolactin levels); galactorrhea, amenorrhea, gynecomastia, impotence, and decreased bone density are associated with prolactin-elevating medications.

- Renal impairment: Use with caution in patients with renal disease; dosage reduction is recommended.

- Seizures: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold. Elderly patients may be at increased risk of seizures due to an increased prevalence of predisposing factors.

Concurrent drug therapy issues:

- Antiemetic effects: May mask toxicity of other drugs or conditions (eg, intestinal obstruction, Reye's syndrome, brain tumor) due to antiemetic effects.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <18 years of age.

Dosage form specific issues:

- Extended-release tablet: Formulation consists of drug within a nonabsorbable shell; following drug release/absorption, the shell is expelled in the stool.

Geriatric ConsiderationsAny changes in disease status in any organ system can result in behavior changes. Extrapyramidal syndrome symptoms occur less with this agent when total daily dose remains ≤6 mg as compared with phenothiazines and butyrophenone classes of antipsychotics.

In the treatment of agitated, demented, elderly patients, authors of meta-analysis of controlled trials of the response to the traditional antipsychotics (phenothiazines, butyrophenones) in controlling agitation have concluded that the use of neuroleptics results in a response rate of 18%. Clearly neuroleptic therapy for behavior control should be limited with frequent attempts to withdraw the agent given for behavior control. In light of significant risks and adverse effects in elderly population compared with limited data demonstrating efficacy in the treatment of dementia related psychosis, aggression, and agitation, an extensive risk:benefit analysis should be performed prior to use.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies with risperidone indicate an increase in fetal mortality. There are no adequate and well-controlled studies in pregnant women. Reversible EPS symptoms were noted in neonates following maternal use of risperidone during the last trimester. Healthcare providers are encouraged to enroll women 18-45 years of age exposed to paliperidone during pregnancy in the Atypical Antipsychotics Pregnancy Registry (1-866-961-2388).

LactationEnters breast milk/use caution

Adverse Reactions

>10%:

Cardiovascular: Tachycardia (12% to 14%)

Central nervous system: Headache (11% to 14%), somnolence (6% to 11% dose dependent)

1% to 10%:

Cardiovascular: Orthostatic hypotension (1% to 4% dose dependent), bundle branch block (<1% to 3%), AV block (first degree ≤2%), arrhythmia (≤2%)

Central nervous system: Akathisia (3% to 10% dose dependent), EPS (2% to 7% dose dependent), parkinsonism (≤7% dose dependent), dizziness (4% to 6%), dystonia (1% to 5% dose dependent), hypertonia (1% to 4% dose dependent), fatigue (1% to 2%)

Endocrine & metabolic: Weight gain (6% to 9% dose dependent)

Gastrointestinal: Salivation increased (≤4% dose dependent), xerostomia (1% to 3%), abdominal pain (1% to 3%)

Neuromuscular & skeletal: Hyperkinesia (3% to 10% dose dependent), dyskinesia (3% to 9% dose dependent), tremor (3% to 4%), weakness (≤2%)

<1%, postmarketing, and/or case reports: Anaphylactic reaction, bradycardia, edema, hyperglycemia, ischemia, neuroleptic malignant syndrome, palpitation, prolactin increased, QT_c interval prolongation, sedation, seizure, syncope, tardive dyskinesia, tongue swelling

Drug Interactions

Acetylcholinesterase Inhibitors (Central): May enhance the neurotoxic (central) effect of Antipsychotics. Severe extrapyramidal symptoms have occurred in some patients. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: Antipsychotics may diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Anti-Parkinson's Agents (Dopamine Agonist): Antipsychotics (Atypical) may diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

CarBAMazepine: May decrease the serum concentration of Paliperidone. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Itraconazole: May decrease the metabolism of Paliperidone. *Risk C: Monitor therapy*

Lithium formulations: May enhance the neurotoxic effect of Antipsychotics. Lithium formulations may decrease the serum concentration of Antipsychotics. Specifically noted with chlorpromazine. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Tetrabenazine: May enhance the adverse/toxic effect of Antipsychotics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid kava kava, gotu kola, valerian, St John's wort (may increase CNS depression).

Monitoring ParametersVital signs; fasting lipid profile and fasting blood glucose/Hgb A_{1c} (prior to treatment, at 3 months, then annually), prolactin levels; BMI, personal/family history of obesity, diabetes, waist circumference; blood pressure; mental status, abnormal involuntary movement scale (AIMS), extrapyramidal symptoms; orthostatic blood pressure changes for 3-5 days after starting or increasing dose. Weight should be assessed prior to treatment, at 4 weeks, 8 weeks, 12 weeks, and then at quarterly intervals. Consider titrating to a different antipsychotic agent for a weight gain ≥5% of the initial weight.

Nursing: Physical Assessment/MonitoringUse with caution in presence of renal disease, cardiovascular disease, hypovolemia, or dehydration. Assess potential for interactions (eg, cumulative CNS depression, hypotension) with other pharmacological agents or herbal products patient may be taking. Assess results of laboratory tests prior to treatment, at 3 months, and annually with long-term therapy. Instruct patients with diabetes to monitor serum glucose closely (may seriously affect glucose control). Assess therapeutic effectiveness (according to purpose for treatment) and adverse reactions (weight gain, cardiovascular changes, extrapyramidal effects, neuroleptic syndrome, CNS changes) regularly during therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsFasting lipid profile and fasting blood glucose/Hgb A_{1c} (prior to treatment, at 3 months, then annually), prolactin levels

Patient EducationDo not take any new prescription or over-the-counter medications or herbal products without consulting prescriber. Take exactly as directed with liquids. Do not chew, crush, or break tablet; swallow whole with liquids. Do not increase dose or frequency or discontinue without consulting prescriber; may take several weeks to achieve desired results. Avoid alcohol or stimulants unless approved by prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. If you have diabetes, you should monitor glucose levels closely; this medication may affect glucose control (notify prescriber of any change in glucose levels). This medication comes in a nonabsorbable shell, after release of the drug the shell is expelled and may be visible in the stool (normal). You may experience fatigue, dizziness, restlessness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug in known); orthostatic hypotension (use caution climbing stairs or when changing position from lying or sitting to standing); nausea, abdominal pain, dry or sore mouth (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); difficulty on urination (void before taking medication). Report immediately any chest pain, rapid or irregular heart beat; difficulty breathing; weight gain >5 pounds; muscle or bone pain, tremors, or unusual movements; altered gait or balance; CNS changes (unusual anxiety or nervousness, abnormal thoughts, excessive sleepiness, dizziness, confusion, or suicidal ideation); or other adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian availability; not available in U.S.

9 mg (100): $1638.97

Mechanism of ActionPaliperidone is considered a benzisoxazole atypical antipsychotic as it is the primary active metabolite of risperidone. As with other atypical antipsychotics, it’s therapeutic efficacy is believed to result from mixed central serotonergic and dopaminergic antagonism. The addition of serotonin antagonism to dopamine antagonism (classic neuroleptic mechanism) is thought to improve negative symptoms of psychoses and reduce the incidence of extrapyramidal side effects. Similar to risperidone, paliperidone demonstrates high affinity to α_1, D_2, H_1, and 5-HT_{2C} receptors, and low affinity for muscarinic and 5-HT_{1A} receptors. In contrast to risperidone, paliperidone displays nearly 10-fold lower affinity for α_2 and 5-HT_{2A} receptors, and nearly three- to fivefold less affinity for 5-HT_{1A} and 5-HT_{1D}, respectively.

Pharmacodynamics/Kinetics

Distribution: V_d: 487 L

Protein binding: 74%

Metabolism: Hepatic via CYP2D6 and 3A4 (limited role in elimination); minor metabolism (<10% each) via dealkylation, hydroxylation, dehydrogenation, and benzisoxazole scission

Bioavailability: 28%

Half-life elimination: 23 hours; 24-51 hours with renal impairment (Cl_{cr} <80 mL/minute)

Time to peak, plasma: ~24 hours

Excretion: Urine (80%); feces (11%)

Pharmacotherapy PearlsInvega® is an extended release tablet based on the OROS® osmotic delivery system. Water from the GI tract enters through a semipermeable membrane coating the tablet, solubilizing the drug into a gelatinous form which, through hydrophilic expansion, is then expelled through laser-drilled holes in the coating.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Significant xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health CommentPaliperidone is an antipsychotic agent of a class often referred to as atypical. It should be noted that the definition of the term “atypical” is not universally agreed upon. Some prefer to describe antipsychotics based on their pharmacological properties. A common feature of all definitions used to describe “atypical” antipsychotics is the lack of significant acute or subacute EPS, at dosages generally associated with antipsychotic actions. Other experts have included definitions of atypicality that include a) failure to increase serum prolactin levels; b) superior efficacy for positive, negative, and cognitive symptoms; and c) lack of evidence of tardive dyskinesia or dystonia following chronic administration. Paliperidone is associated with a dose dependent increase in EPS; however, there was no difference compared with placebo in the incidence of any EPS symptoms at doses ≤6 mg/day.

Tardive dyskinesia (TD) secondary to **typical** antipsychotics has an estimated incidence of 3% to 5% per year for the first 5 years of treatment. The incidence of TD associated with the atypical antipsychotics is estimated to be 0.5% to 1%. It is not clear if this estimate represents a risk associated with mental illness or to what extent drug therapy can be implicated. Atypical antipsychotics appear less likely to cause tardive dyskinesia than typical antipsychotics (fluphenazine, haloperidol).

Coadministration of two or more antipsychotics does not generally improve clinical response and may increase the potential for adverse effects.

In 2008, the FDA issued a warning regarding increased mortality risk with typical **and** atypical antipsychotic drugs when used in elderly patients with dementia-related psychosis.

Cardiovascular ConsiderationsPaliperidone may cause orthostatic hypotension and tachycardia but to a degree which may be less than is seen with other agents (eg, phenothiazines [chlorpromazine, thioridazine]). Paliperidone may also prolong the QT interval. For these reasons, patient's with cardiovascular disease should be monitored closely while on therapy.

Anesthesia and Critical Care Concerns/Other ConsiderationsPaliperidone may cause orthostatic hypotension and tachycardia but to a degree which may be less than is seen with other agents (eg, phenothiazines [chlorpromazine, thioridazine]). Paliperidone may also prolong the QT interval. For these reasons, patient's with cardiovascular disease should be monitored closely while on therapy.

Index Terms9-hydroxy-risperidone; 9-OH-risperidone

Medication Safety Issues

Sound-alike/look-alike issues:

Synagis® may be confused with Synalgos®-DC, Synvisc®

Pronunciation(pah li VIZ u mab)
U.S. Brand NamesSynagis®
Canadian Brand NamesSynagis®
Pharmacologic CategoryMonoclonal Antibody
Use: Labeled IndicationsPrevention of serious lower respiratory tract disease caused by respiratory syncytial virus (RSV) in infants and children at high risk of RSV disease
Dosing: Pediatric

Prevention of RSV: I.M.: Infants and Children <2 years: 15 mg/kg of body weight, monthly throughout RSV season (first dose administered prior to commencement of RSV season)

Note:*Cardiopulmonary bypass patients:* I.M.: Administer a dose as soon as possible after cardiopulmonary bypass procedure, even if <1 month from previous dose.

Administration: I.M.Injection should (preferably) be in the anterolateral aspect of the thigh; gluteal muscle should not be used routinely; injection volume over 1 mL should be given as divided doses
StorageStore in refrigerator at a temperature between 2°C to 8°C (35.6°F to 46.4°F) in original container; do not freeze. Do not shake, vigorously agitate or dilute the solution.
ContraindicationsHistory of severe prior reaction to palivizumab or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Very rare cases of anaphylaxis have been observed; rare cases of severe acute hypersensitivity reactions have also been reported. Use with caution after mild hypersensitivity reaction; permanently discontinue for severe hypersensitivity reaction.

Disease-related concerns:

- Bleeding disorders: Use with caution in patients with a history of bleeding disorders (including thrombocytopenia); bleeding/hematoma may occur from I.M. administration.

- Respiratory syncytial virus (RSV): Safety and efficacy have not been demonstrated in the treatment of established RSV disease.

Special populations:

- Pediatrics: Safety and efficacy have been established in infants with chronic lung disease, infants with a history of premature birth (≤35 weeks gestational age), and children with hemodynamically-significant congenital heart disease (CHD).

Pregnancy Risk FactorC
Pregnancy ConsiderationsNot for adult use; reproduction studies have not been conducted
Adverse ReactionsThe incidence of adverse events was similar between the palivizumab and placebo groups.
>1%:

Cardiovascular: Arrhythmia, cyanosis

Central nervous system: Fever, nervousness

Dermatologic: Rash

Gastrointestinal: Diarrhea, gastroenteritis, vomiting

Hepatic: ALT increase

Otic: Otitis media

Respiratory: Cough, rhinitis, upper respiratory infection, wheezing

<1%, postmarketing, and/or case reports: Anaphylaxis (very rare - includes angioedema, dyspnea, hypotonia, pruritus, respiratory failure, unresponsiveness, urticaria); antibody development, hypersensitivity reactions, injection site reactions, thrombocytopenia

Drug Interactions

Abciximab: May enhance the potential for allergic or hypersensitivity reactions to Monoclonal Antibodies. Also may cause thrombocytopenia or diminished therapeutic effects. *Risk C: Monitor therapy*

Monitoring ParametersMonitor for anaphylaxis or acute hypersensitivity reactions

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Synagis®: 100 mg/mL (0.5 mL, 1 mL)

Generic AvailableNo

ManufacturerMedImmune, Inc

Mechanism of ActionExhibits neutralizing and fusion-inhibitory activity against RSV; these activities inhibit RSV replication in laboratory and clinical studies

Pharmacodynamics/Kinetics

Half-life elimination: Children <24 months: 20 days

Time to peak, serum: 48 hours

Pharmacotherapy PearlsRSV prophylaxis should be initiated at the onset of the RSV season. In most areas of the United States, onset of RSV outbreaks is October to December, and termination is March to May, but regional differences occur.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay rarely cause nervousness

Mental Health: Effects on Psychiatric TreatmentMay cause anemia; use caution with clozapine and carbamazepine

Medication Safety Issues

Sound-alike/look-alike issues:

Aloxi® may be confused with Eloxatin®, oxaliplatin

Palonosetron may be confused with dolasetron, granisetron, ondansetron

Pronunciation(pal oh NOE se tron)

U.S. Brand NamesAloxi®

Pharmacologic CategoryAntiemetic; Selective 5-HT_3 Receptor Antagonist

Use: Labeled Indications

I.V.: Prevention of chemotherapy-associated nausea and vomiting; indicated for prevention of acute (highly-emetogenic therapy) as well as acute and delayed (moderately-emetogenic therapy) nausea and vomiting; prevention of postoperative nausea and vomiting (PONV)

Oral: Prevention of chemotherapy-associated nausea and vomiting (moderately-emetogenic therapy)

Dosing: Adults

Chemotherapy-associated nausea and vomiting:

I.V.: 0.25 mg 30 minutes prior to the start of chemotherapy administration, day 1 of each cycle

Oral: 0.5 mg 1 hour prior to the start of chemotherapy

Breakthrough: Palonosetron has not been shown to be effective in terminating nausea or vomiting once it occurs and should not be used for this purpose.

PONV: I.V.: 0.075 mg immediately prior to anesthesia induction

Dosing: ElderlyNo dosage adjustment necessary.

Dosing: Renal ImpairmentNo dosage adjustment necessary.

Dosing: Hepatic ImpairmentNo dosage adjustment necessary.

Administration: I.V.Flush I.V. line with NS prior to and following administration.

Chemotherapy-associated nausea and vomiting: Infuse over 30 seconds, 30 minutes prior to the start of chemotherapy

PONV: Infuse over 10 seconds immediately prior to anesthesia induction

Administration: I.V. DetailpH: 4.5-5.5

Administration: OralMay administer with or without meals.

Dietary ConsiderationsCapsule: May be taken with or without meals.

Storage

Capsule: Store at room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from light.

Injection: Store intact vials at room temperature of 20°C to 25°C (68°F to 77°F); excursions permitted to 15°C to 30°C (59°F to 86°F); do not freeze. Protect from light. Solutions of 5 mcg/mL and 30 mcg/mL in NS, D_5W, $D_5$1/2NS, and D_5LR injection are stable for 48 hours at room temperature and 14 days under refrigeration.

CompatibilityStable in D_5W, NS, $D_5$1/2NS, and D_5LR.

Y-site administration: Compatible: Atropine, carboplatin, cisplatin, cyclophosphamide, dacarbazine, docetaxel, doxorubicin, epirubicin, famotidine, fentanyl, fluorouracil, gemcitabline, heparin, hydromorphone, ifosfamide, irinotecan, lidocaine, lorazepam, meperidine, metoclopramide, midazolam, morphine, oxaliplatin, paclitaxel, potassium chloride, promethazine, sufentanil, topotecan. **Incompatible:** Methylprednisolone

Compatibility in syringe: Compatible: Dexamethasone

Compatibility when admixed: Compatible: Dexamethasone

ContraindicationsHypersensitivity to palonosetron or any component of the formulation

Allergy Considerations

- Serotonin 5-HT_3 Antagonist Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hypersensitivity reactions: Hypersensitivity has been observed rarely with I.V. palonosetron. Use with caution in patients allergic to other 5-HT$_3$ receptor antagonists; cross-reactivity has been reported.

- ECG effects: Some selective 5-HT$_3$ receptor antagonists have been associated with dose-dependent increases in ECG intervals (eg, PR, QRS duration, QT/QT$_c$, JT), usually occurring 1-2 hours after I.V. administration. In general, these changes are not clinically relevant, however, when these agents are used in conjunction with other agents that prolong these intervals, arrhythmia may occur. When used with agents that prolong the QT interval (eg, Class I and III antiarrhythmics), clinically relevant QT interval prolongation could result in torsade de pointes. A number of trials have shown that 5-HT$_3$ antagonists produce QT interval prolongation to variable degrees. Use with caution in patients at risk of QT prolongation and/or ventricular arrhythmia. Reduction in heart rate may also occur with the 5-HT$_3$ antagonists.

Disease-related concerns:

- Long QT syndrome: Use with caution in patients with congenital long QT syndrome or other risk factors for QT prolongation (eg, medications known to prolong QT interval, electrolyte abnormalities [hypokalemia or hypomagnesemia], and cumulative high-dose anthracycline therapy).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Chemotherapy-associated emesis: **For chemotherapy, should be used on a scheduled basis, not on an "as needed" (PRN) basis,** since data support the use of this drug only in the prevention of nausea and vomiting (due to antineoplastic therapy) and not in the rescue of nausea and vomiting. Not intended for treatment of nausea and vomiting or for chronic continuous therapy.

- PONV: Use is not recommended if there is little expectation of PONV; may use for low expectation of PONV if it is essential to avoid nausea and vomiting in the postoperative period.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women; use during pregnancy only if clearly needed.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsThe extent to which palonosetron is excreted in breast milk, if at all, is unknown. Due to the potential for adverse effects in the nursing infant, breast-feeding is not recommended.

Adverse ReactionsAdverse events may vary according to indication. In general, adverse reactions similar between I.V. and oral dosage forms.

1% to 10%:

Cardiovascular: QT prolongation (chemotherapy-associated <1%; PONV 1% to 5%), bradycardia (chemotherapy-associated 1%; PONV 4%), hypotension (≤1%), sinus bradycardia (≤1%), tachycardia (nonsustained) (≤1%)

Central nervous system: Headache (chemotherapy-associated 4% to 9%; PONV 3%), anxiety (1%), dizziness (≤1%), fatigue (≤1%)

Dermatologic: Pruritus (≤1%)

Endocrine & metabolic: Hyperkalemia (1%)

Gastrointestinal: Constipation (1% to 5%), diarrhea (≤1%), flatulence (≤1%)

Genitourinary: Urinary retention (≤1%)

Hepatic: ALT increased (≤1%; transient), AST increased (≤1%; transient)

Neuromuscular & skeletal: Weakness (1%)

<1%, postmarketing, and/or case reports: Abdominal pain, abnormal taste, allergic dermatitis, alopecia, amblyopia, anemia, anorexia, appetite decreased, arrhythmia, arthralgia, atrioventricular block (first and second degree), bilirubin increased (transient), chills, dyspepsia, dyspnea, edema (generalized), electrolyte fluctuations, epistaxis, erythema, euphoric mood, extrasystoles, eye irritation/edema, fever, flu-like syndrome, gastritis, glycosuria, hiccups, hot flash, hyperglycemia, hypersensitivity (rare), hypersomnia, hypertension, hypokalemia, hypoventilation, injection site reactions (burning/discomfort/induration/pain; rare), insomnia, intestinal hypomotility, joint stiffness, laryngospasm, metabolic acidosis, motion sickness, myalgia, myocardial ischemia, pain in extremities, paresthesia, platelets decreased, rash, salivation increased, sinus arrhythmia, sinus tachycardia, sinusitis, somnolence, supraventricular extrasystoles, tinnitus, T-wave amplitude decreased, vein discoloration, vein distention, ventricular extrasystoles, xerostomia

Metabolism/Transport Effects**Substrate** (minor) of CYP1A2, 2D6, 3A4

Drug Interactions

Apomorphine: Antiemetics (5HT3 Antagonists) may enhance the hypotensive effect of Apomorphine. *Risk X: Avoid combination*

Nursing: Physical Assessment/MonitoringAssess allergy history (selective 5-HT$_3$ receptor antagonists) prior to administering. Use with caution in presence of, or potential for, cardiac conduction abnormalities (eg, QT prolongation, medication known to prolong QT interval, electrolyte abnormalities). To be used on a scheduled basis (not on a "PRN" basis) for prevention of nausea and vomiting associated with moderately to highly emetogenic cancer chemotherapy; not recommended for treatment of existing chemotherapy-induced emesis. Follow infusion specifics. Assess patient response and adverse reactions at beginning and periodically during therapy. Teach patient possible side effects and adverse symptoms to report.

Patient EducationThis drug is given to reduce the incidence of nausea and vomiting. Do not take any other medication for nausea and vomiting with this medication unless approved by prescriber. This medication can only be given by intravenous infusion and you will be monitored during infusion. Report immediately any chest pain, respiratory difficulty, pain or itching at infusion site. May cause headache, drowsiness, or dizziness (request assistance when getting up or changing position and do not perform activities requiring alertness until response to drug is known). Report chest pain or palpitations; persistent headache; excessive drowsiness; fever; or changes in elimination patterns (constipation or diarrhea) or other adverse effects. **Breast-feeding precaution:** Consult prescriber if you are or intend to breast-feed.

Product AvailabilityAloxi® capsules: FDA approved August 2008; availability anticipated in the first quarter of 2009

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Aloxi®: 0.5 mg

Injection, solution:

Aloxi®: 0.05 mg/mL (1.5 mL, 5 mL) [contains edetate disodium]

Generic AvailableNo

ManufacturerEisai, Inc

Pricing: U.S. (www.drugstore.com)

Solution (Aloxi)

0.25 mg/5 mL (5): $394.25

Mechanism of ActionSelective 5-HT$_3$ receptor antagonist, blocking serotonin, both on vagal nerve terminals in the periphery and centrally in the chemoreceptor trigger zone

Pharmacodynamics/Kinetics

Absorption: Well absorbed

Distribution: V$_d$: 8.3 ± 2.5 L/kg

Protein binding: ~62%

Metabolism: ~50% metabolized via CYP enzymes (and likely other pathways) to relatively inactive metabolites (N-oxide-palonosetron and 6-S-hydroxy-palonosetron); CYP1A2, 2D6, and 3A4 contribute to its metabolism

Bioavailability: Oral: 97%

Half-life elimination: I.V.: Terminal: ~40 hours; Oral: 29-45 hours (healthy patients), 38-62 hours (cancer patients)

Time to peak, plasma: Oral: 3-7 hours (healthy patients); ~5 hours (cancer patients)

Excretion: Urine (80% to 93%, 40% as unchanged drug); feces (5% to 8%)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause anxiety and dizziness; may rarely cause euphoria, insomnia, or sedation

Mental Health: Effects on Psychiatric TreatmentUse caution with thioridazine and ziprasidone; combined use may cause QT prolongation

Index TermsPalonosetron Hydrochloride; RS-25259; RS-25259-197

Special Alerts

Bisphosphonates: Safety Update Regarding Possible Association With Atrial Fibrillation - November 2008

The Food and Drug Administration (FDA) has been reviewing placebo-controlled trials of the 7 bisphosphonates currently marketed in the US. This review is in response to study results associating an increased incidence of atrial fibrillation (AF) with alendronate or zoledronic acid use in women (65-89 years of age) with osteoporosis.

The FDA reviewed all the submitted data (19,687 bisphosphonate-treated patients and 18,358 placebo-treated patients) from these studies. Overall, the occurrence of AF was rare in each study with an absolute difference in event rates between each of the bisphosphonate and placebo arms of 0-3 per 1000. A zoledronic acid study showed a statistically significant increase in the rate of AF in the active treatment arm. However, no clear association between bisphosphonate use and AF could be established. In this study, AF events were diagnosed more than 30 days after receiving zoledronic acid in 47 of the 50 patients diagnosed with AF. According to the FDA, healthcare providers should not alter their prescribing patterns for bisphosphonates and patients should not stop taking their medication.

The FDA will continue monitoring the safety of bisphosphonates through postmarketing reports and is assessing the need for additional epidemiologic studies.

Further information is available at http://www.fda.gov/cder/drug/early_comm/bisphosphonates_update_200811.htm

Medication Safety Issues

Sound-alike/look-alike issues:

Aredia® may be confused with Adriamycin, Meridia®

International issues:

Linoten® [Spain] may be confused with Lidopen® which is a brand name for lidocaine in the U.S.

Pronunciation(pa mi DROE nate)

U.S. Brand NamesAredia®

Canadian Brand NamesAredia®; Pamidronate Disodium®; Rhoxal-pamidronate

Pharmacologic CategoryAntidote; Bisphosphonate Derivative

Use: Labeled IndicationsTreatment of hypercalcemia associated with malignancy; treatment of osteolytic bone lesions associated with multiple myeloma or metastatic breast cancer; moderate to severe Paget's disease of bone

Use: Unlabeled/InvestigationalTreatment of pediatric osteoporosis, treatment of osteogenesis imperfecta

Dosing: AdultsDilute prior to administration and infuse intravenously slowly over at least 2 hours. Single doses should not exceed 90 mg.

Hypercalcemia of malignancy: I.V.:

Moderate cancer-related hypercalcemia (corrected serum calcium: 12-13.5 mg/dL): 60-90 mg, as a single dose over 2-24 hours

Severe cancer-related hypercalcemia (corrected serum calcium: >13.5 mg/dL): 90 mg, as a single dose over 2-24 hours

Repeat dosing: A period of 7 days should elapse before the use of second course; repeat infusions every 2-3 weeks have been suggested, however, could be administered every 2-3 months according to the degree and of severity of hypercalcemia and/or the type of malignancy.

Osteolytic bone lesions with multiple myeloma: 90 mg over 2-4 hours monthly

Osteolytic bone lesions with metastatic breast cancer: 90 mg over 2 hours repeated every 3-4 weeks

Paget's disease: 30 mg over 4 hours daily for 3 consecutive days

Dosing: ElderlyRefer to adult dosing. Begin at lower end of adult dosing range.

Dosing: Renal Impairment Safety and efficacy have not been established in patients with serum creatinine >5 mg/dL; studies are limited in multiple myeloma patients with serum creatinine ≥3 mg/dL

The manufacturer recommends the following guidelines:

Treatment of bone metastases: Use is not recommended in patients with severe renal impairment.

Renal impairment in indications other than bone metastases: Use clinical judgment to determine if benefits outweigh potential risks.

American Society of Clinical Oncology (ASCO) guidelines for bisphosphonate use in multiple myeloma (Kyle, 2007) recommend considering a reduced initial dose in patients with pre-existing renal impairment.

Dosing adjustment in renal toxicity: In patients with bone metastases, treatment should be withheld for deterioration in renal function (increase of serum creatinine ≥0.5 mg/dL in patients with normal baseline or ≥1.0 mg/dL in patients with abnormal baseline). Resumption of therapy may be considered when serum creatinine returns to within 10% of baseline.

Dosing: Hepatic ImpairmentNo adjustment required in patients with mild-to-moderate hepatic impairment; not studied in patients with severe hepatic impairment.

Calculations

- Calcium Correction

Administration: I.V.I.V. infusion over 2-24 hours. Longer infusion times (>2 hours) may reduce the risk for renal toxicity, especially in patients with pre-existing renal insufficiency. The manufacturer recommends infusing over 2-24 hours for hypercalcemia of malignancy; over 2 hours for osteolytic bone lesions with metastatic breast cancer; and over 4 hours for Paget's disease and for osteolytic bone lesions with multiple myeloma. The ASCO guidelines for bisphosphonate use in multiple myeloma recommend infusing pamidronate over at least 2 hours; if therapy is withheld due to renal toxicity, infuse over at least 4 hours upon reintroduction of treatment after renal recovery.

Administration: I.V. DetailpH: 6-7.4

Dietary ConsiderationsMultiple myeloma or metastatic bone lesions from solid tumors or Paget's disease: Take adequate daily calcium and vitamin D supplement

Storage

Powder for reconstitution: Store below 30°C (86°F). The reconstituted solution is stable for 24 hours stored under refrigeration at 2°C to 8°C (36°F to 46°F).

Solution for injection: Store at 20°C to 25°C (68°f to 77°F).

Pamidronate solution for infusion is stable at room temperature for up to 24 hours.

ReconstitutionPowder for injection: Reconstitute by adding 10 mL of SWFI to each vial of lyophilized pamidronate disodium powder, the resulting solution will be 30 mg/10 mL or 90 mg/10 mL.

Pamidronate may be further diluted in 250-1000 mL of 0.45% or 0.9% sodium chloride or 5% dextrose. (The manufacturer recommends dilution in 1000 mL for hypercalcemia of malignancy, 500 mL for Paget's disease and bone metastases of myeloma, and 250 mL for bone metastases of breast cancer.)

Compatibility**Incompatible** with calcium-containing infusion solutions such as Ringer's injection.

ContraindicationsHypersensitivity to pamidronate, other bisphosphonates, or any component of the formulation

Allergy Considerations

- Bisphosphonate Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Bone/joint/muscle pain: Infrequently, severe (and occasionally debilitating) bone, joint, and/or muscle pain have been reported during bisphosphonate treatment. The onset of pain ranged from a single day to several months. Symptoms usually resolve upon discontinuation. Some patients experienced recurrence when rechallenged with same drug or another bisphosphonate; avoid use in patients with a history of these symptoms in association with bisphosphonate therapy.

- Electrolyte abnormalities: Use has been associated with asymptomatic electrolyte abnormalities (including hypophosphatemia, hypokalemia, hypomagnesemia, and hypocalcemia). Rare cases of symptomatic hypocalcemia, including tetany have been reported.

- Leukopenia: Oral therapy has been associated with leukopenia and monitoring of white blood cell counts is suggested. Patients with pre-existing anemia, leukopenia, or thrombocytopenia should be closely monitored during the first 2 weeks of treatment.

- Osteonecrosis of the jaw: Bisphosphonate therapy has been associated with osteonecrosis, primarily of the jaw; this has been observed mostly in cancer patients, but also in patients with postmenopausal osteoporosis and other diagnoses. Risk factors include a diagnosis of cancer, with concomitant chemotherapy, radiotherapy, or corticosteroids; anemia, coagulopathy, infection, or pre-existing dental disease. Symptoms included nonhealing extraction socket or an exposed jawbone. There are no data addressing whether discontinuation of therapy reduces the risk of developing osteonecrosis; however, as a precautionary measure, dental exams and preventative dentistry should be performed prior to placing patients with risk factors on chronic bisphosphonate therapy. Invasive dental procedures should be avoided during treatment.

- Renal deterioration: Single pamidronate doses should not exceed 90 mg. Initial or single doses have been associated with renal deterioration, progressing to renal failure and dialysis. Glomerulosclerosis (focal segmental) with or without nephrotic syndrome has also been reported. Longer infusion times (>2 hours) may reduce the risk for renal toxicity, especially in patients with pre-existing renal insufficiency. Withhold pamidronate treatment (until renal function returns to baseline) in patients with evidence of renal deterioration.

- Thrombophlebitis: Vein irritation and thrombophlebitis may occur with infusions.

Disease-related concerns:

- Hypercalcemia of malignancy: Adequate hydration is required during treatment (urine output ~2 L/day); avoid overhydration, especially in patients with heart failure.

- Hypoparathyroidism: Use caution with a history of thyroid surgery; patients may have relative hypoparathyroidism, predisposing them to pamidronate-related hypocalcemia.

- Renal impairment: Patients with serum creatinine >3 mg/dL were not studied in clinical trials; limited data is available in patients with Cl_{cr} <30 mL/minute. Evaluate serum creatinine prior to each treatment. For the treatment of bone metastases, use is not recommended in patients with severe renal impairment. With indications other than bone metastases, use clinical judgment to determine if benefits outweigh potential risks in patients with renal impairment.

Special populations:

- Women of childbearing potential: Women of childbearing potential should be advised to use effective contraception and avoid becoming pregnant during therapy.

Geriatric ConsiderationsOf the studies done with this drug, approximately 20% of the patients were ≥65 years of age with 15% ≥75 years. No differences were noted between elderly and younger adults. Dosing should be initiated with lowest recommended dose in elderly. Monitor serum electrolytes periodically since the elderly are often receiving diuretics which can result in decreases in serum calcium, potassium, and magnesium.

Pregnancy Risk FactorD

Pregnancy ConsiderationsPamidronate has been shown to cross the placenta and cause nonteratogenic embryo/fetal effects in animals. There are no adequate and well-controlled studies in pregnant women; manufacturer states pamidronate should not be used in pregnancy. Based on limited case reports, serum calcium levels in the newborn may be altered if pamidronate is administered during pregnancy. Bisphosphonates are incorporated into the bone matrix and gradually released over time. Theoretically, there may be a risk of fetal harm when pregnancy follows the completion of therapy. Women of childbearing potential should be advised to use effective contraception and avoid becoming pregnant during therapy.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions**Note:** Actual percentages may vary by indication; treatment for multiple myeloma is associated with higher percentage.

>10%:

Central nervous system: Fatigue (≤37%), fever (18% to 39%), headache (≤26%), insomnia (≤22%)

Endocrine & metabolic: Hypophosphatemia (≤18%), hypokalemia (4% to 18%), hypomagnesemia (4% to 12%), hypocalcemia (≤12%)

Gastrointestinal: Nausea (≤54%), vomiting (≤36%), anorexia (≤26%), abdominal pain (≤23%), dyspepsia (≤23%)

Genitourinary: Urinary tract infection (≤19%)

Hematologic: Anemia (≤43%), granulocytopenia (≤20%)

Local: Infusion site reaction (≤18%; includes induration, pain, redness and swelling)

Neuromuscular & skeletal: Weakness (≤22%), myalgia (≤26%), arthralgia (≤14%), osteonecrosis of the jaw (cancer patients: 1% to 11%)

Renal: Serum creatinine increased (≤19%)

Respiratory: Dyspnea (≤30%), cough (≤26%), upper respiratory tract infection (≤24%), sinusitis (≤16%), pleural effusion (≤11%)

1% to 10%:

Cardiovascular: Atrial fibrillation (≤6%), hypertension (≤6%), syncope (≤6%), tachycardia (≤6%), atrial flutter (≤1%), cardiac failure (≤1%), edema (≤1%)

Central nervous system: Somnolence (≤6%), psychosis (≤4%)

Endocrine & metabolic: Hypothyroidism (≤6%)

Gastrointestinal: Constipation (≤6%), gastrointestinal hemorrhage (≤6%), diarrhea (≤1%), stomatitis (≤1%)

Hematologic: Leukopenia (≤4%), neutropenia (≤1%), thrombocytopenia (≤1%)

Neuromuscular & skeletal: Back pain (≤5%), bone pain (≤5%)

Renal: Uremia (≤4%)

Respiratory: Rales (≤6%), rhinitis (≤6%)

Miscellaneous: Moniliasis (≤6%)

<1%, postmarketing, and/or case reports: Acute renal failure, adult respiratory distress syndrome, allergic reaction, anaphylactic shock, angioedema, bronchospasm, CHF, confusion, conjunctivitis, electrolyte/mineral abnormality, episcleritis, fluid overload, flu-like syndrome, focal segmental glomerulosclerosis (including collapsing variant), hallucinations (visual), hematuria, herpes virus reactivation, hyperkalemia, hypernatremia, hypotension, injection site phlebitis/thrombophlebitis, interstitial pneumonitis, iridocyclitis, iritis, joint and/or muscle pain (sometimes severe and/or incapacitating), left ventricular failure, lymphocytopenia, malaise, nephrotic syndrome, osteonecrosis (other than jaw), paresthesia, pruritus, rash, renal deterioration, scleritis, seizure, tetany, uveitis, xanthopsia

Oncology: VesicantNo

Oncology: Emetic PotentialLow

Drug Interactions

Aminoglycosides: May enhance the hypocalcemic effect of Bisphosphonate Derivatives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Phosphate Supplements: Bisphosphonate Derivatives may enhance the hypocalcemic effect of Phosphate Supplements. *Risk C: Monitor therapy*

Thalidomide: May enhance the nephrotoxic effect of Pamidronate. *Risk C: Monitor therapy*

Test InteractionsBisphosphonates may interfere with diagnostic imaging agents such as technetium-99m-diphosphonate in bone scans.

Monitoring ParametersSerum creatinine (prior to each treatment); serum electrolytes, including calcium, phosphate, magnesium and potassium; CBC with differential; monitor for hypocalcemia for at least 2 weeks after therapy; dental exam and preventative dentistry for patients at risk for osteonecrosis; patients with pre-existing anemia, leukopenia, or thrombocytopenia should be closely monitored during the first 2 weeks of treatment

Reference RangeCalcium (total): Adults: 9.0-11.0 mg/dL (SI: 2.05-2.54 mmol/L), may slightly decrease with aging; Phosphorus: 2.5-4.5 mg/dL (SI: 0.81-1.45 mmol/L)

Nursing: Physical Assessment/MonitoringAssess results of laboratory tests, therapeutic effectiveness and adverse reactions. Monitor for signs of hypocalcemia or renal failure. Teach patient lifestyle and dietary changes that will be beneficial, possible side effects, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsSerum creatinine (prior to each treatment); serum electrolytes, including calcium, phosphate, magnesium and potassium; CBC with differential; monitor for hypocalcemia for at least 2 weeks after therapy; patients with pre-existing anemia, leukopenia, or thrombocytopenia should be closely monitored during the first 2 weeks of treatment

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication can only be administered intravenously; report immediately any difficulty breathing, chest tightness, difficulty swallowing, redness, swelling, or pain at infusion site. You may experience nausea or vomiting (small frequent meals and good mouth care may help); loss of appetite; abdominal pain; heartburn; recurrent bone pain (consult prescriber for analgesic); fever; headache; anxiety; insomnia; increased fatigue (adequate rest is important); dizziness (use caution when driving or engaging in tasks that require alertness until response to drug is known). Report palpitations or rapid heart beat, unusual muscle twitching or spasms, persistent diarrhea/constipation, unusual weight gain, decreased urine output, swelling of extremeties, acute bone pain, respiratory difficulty, or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not get pregnant during therapy. Consult prescriber for instructions on appropriate contraceptive measures. This drug may cause fetal defects. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as disodium: 30 mg, 90 mg

Aredia®: 30 mg, 90 mg

Injection, solution: 3 mg/mL (10 mL); 6 mg/mL (10 mL); 9 mg/mL (10 mL)

Generic AvailableYes

Mechanism of ActionA bisphosphonate which inhibits bone resorption via actions on osteoclasts or on osteoclast precursors. Does not appear to produce any significant effects on renal tubular calcium handling and is poorly absorbed following oral administration (high oral doses have been reported effective); therefore, I.V. therapy is preferred.

Pharmacodynamics/Kinetics

Onset of action: 24-48 hours

Peak effect: Maximum: 5-7 days

Absorption: Poor; pharmacokinetic studies lacking

Metabolism: Not metabolized

Half-life elimination: 21-35 hours

Excretion: Biphasic; urine (30% to 62% as unchanged drug; lower in patients with renal dysfunction) within 120 hours

Dental Health Professional ConsiderationsNovartis Pharmaceuticals Corporation has notified dental health professionals of the risk of **osteonecrosis of the jaw (ONJ)** and the use of the intravenous bisphosphonates, pamidronate (Zometa®) and zoledronic acid (Aredia®): *"Dear Dental Health Professional" Letter Issued for Intravenous Bisphosphonates, Pamidronate and Zoledronic Acid, Regarding the Risk of Osteonecrosis of the Jaw (ONJ) in Cancer Patients* – May 2005.

Often observed in patients receiving chemotherapy and corticosteroids, reports of ONJ (the majority being associated with dental procedures) have been documented in cancer patients. Dental exams and preventative dentistry should be performed prior to placing patients with risk factors (chemotherapy, corticosteroids, poor oral hygiene) on intravenous bisphosphonate therapy. Additionally, invasive dental procedures should be avoided during therapy; patients developing ONJ while on bisphosphonate therapy should not have invasive dental procedures because the condition may be exacerbated. It has not been determined whether the discontinuation of bisphosphonate therapy in patients requiring dental surgery decreases the risk of ONJ. The treating healthcare professional is encouraged to assess the benefits and risks.

Bisphosphonates are widely used in the management of metastatic bone disease to treat hypercalcemia associated with malignancies and to treat osteoporosis. It is suggested that because of the trend in the use of chronic bisphosphonate therapy, the observation of an associated risk of osteonecrosis of the jaw should alert practitioners to monitor for this previously unrecognized potential complication.

Additional information is available at http://www.fda.gov/medwatch/SAFETY/2005/safety05.htm#zometa2, or by contacting Novartis Oncology Medical Services at 1-888-669-6682.

Estimates of Percent Incidence of ONJ in Treated Cancer Patients

Two reports have attempted to assess the percent of cancer patients developing ONJ after bisphosphonate treatment. Maerevoet et al, reported that among 194 patients treated with Zometa® every 3-4 weeks, nine developed ONJ. Before receiving Zometa®, six had received Aredia® 90 mg every 3-4 weeks. The median duration of treatment with Aredia® was 39 months and for Zometa® 18 months. The incidence of ONJ in these patients was calculated to be 4.6%. Durie et al, described the results of a survey by the International Myeloma Foundation in 2004 to assess the risk factors of ONJ. Out of 1203 respondents, 904 had myeloma and 299 breast cancer. Of the myeloma patients, 62 developed ONJ and 54 had suspicious findings. Of the breast cancer patients, 13 had ONJ and 23 had suspicious findings. The total number of cases of either ONJ or suspicious findings was 152. ONJ developed in 10% of 211 patients receiving Zometa® compared to 4% of 413 receiving Aredia®. The mean time to onset of ONJ among patients taking Zometa® was 18 months; the mean time to onset after Aredia® was 6 years. It should be noted that an early report by authors from Novartis Pharmaceuticals Corporation (Tarassoff, 2003) stressed that Aredia® and Zometa® had been used in 2.5 million patients world wide and reports of ONJ during their extensive use had been rare. In addition, these authors stated that review of the reported cases revealed multiple risk factors for avascular necrosis. McMahon et al, followed up with a report that, along with other factors, bisphosphonates are additional stressors of bone health that can tip the balance to osteonecrosis. They suggested that the prevention of ONJ should be stressed such as the elimination of chronic dental infections prior to chemotherapy and bisphosphonate use in cancer patients.

Dental Health: Effects on Dental TreatmentOsteonecrosis of the jaw (ONJ), generally associated with local infection and/or tooth extraction and often with delayed healing, has been reported in patients taking bisphosphonates. Most reported cases of bisphosphonate-associated osteonecrosis have been in cancer patients treated with intravenous bisphosphonates. However, some have occurred in patients with postmenopausal osteoporosis taking oral bisphosphonates. Dental surgery may exacerbate ONJ. For patients requiring dental procedures, there are no data available to suggest whether discontinuation of bisphosphonate treatment reduces the risk of ONJ. See Dental Comment.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness

Mental Health: Effects on Psychiatric TreatmentMay rarely cause leukopenia; use caution with clozapine and carbamazepine. Bisphosphonates, including pamidronate, have been associated with renal toxicity manifested as deterioration of renal function and potential renal failure. Use caution in patients receiving lithium.

Index TermsPamidronate Disodium

Medication Safety Issues

Sound-alike/look-alike issues:

Pancreatin may be confused with Panretin®

Pronunciation(PAN kree a tin)
U.S. Brand NamesDygase [DSC]; Hi-Vegi-Lip [OTC]; ku-zyme® [DSC]; kutrase® [DSC]; Lapase [DSC]; Pan-2400™ [OTC]; Veg-Pancreatin 4X [OTC]
Pharmacologic CategoryEnzyme
Use: Labeled IndicationsRelief of functional indigestion due to enzyme deficiency or imbalance
Dosing: AdultsActual dose varies with condition of patient and is usually given with each meal or snack.

Malabsorption: Oral:

ku-zyme®: 1-2 capsules with each meal or snack

kutrase®: 1 capsule with each meal or snack

Dosing: ElderlyRefer to adult dosing.
Administration: OralSwallow capsules/tablets whole; retention in the mouth before swallowing may cause mucosal irritation and stomatitis. Capsules may also be opened and sprinkled on soft food (do not chew).
Dietary ConsiderationsShould be taken with a meal or snack. Capsules may be opened and sprinkled on soft food.
StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F). Protect from humidity.
ContraindicationsHypersensitivity to pork protein or any component of the formulation; acute pancreatitis or acute exacerbations of chronic pancreatic disease
Warnings/Precautions

Dosage form specific issues:

- Pork: Some products are made from pork protein and should not be used if allergic to pork.

Geriatric ConsiderationsNo special considerations necessary since drug is dosed to response; however, drug-induced diarrhea can result in unwanted side effects (confusion, hypotension, lethargy, fluid electrolyte loss).
Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/use caution
Breast-Feeding ConsiderationsSystemic absorption and concentration in the breast milk is unlikely, but unknown.
Adverse ReactionsFrequency not defined.

Gastrointestinal: Loose stools (decrease dose)

Respiratory: Mucous membrane irritation or precipitation of asthma attack (due to inhalation of airborne powder)

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule: Lipase 8500 units, protease 50,000 units, amylase 50,000 units [pancreatin 500 mg]

Dygase, kutrase®: Lipase 2400 units, protease 30,000 units, amylase 30,000 units [DSC]

ku-zyme®: Lipase 1200 units, protease 15,000 units, amylase 15,000 units [DSC]

Lapase: Lipase 1200 units, protease 15,000 units, and amylase 15,000 units [contains tartrazine] [DSC]

Pan-2400™: Lipase 9816 units, protease 60,214 units, amylase 75,900 units [pancreatin 2400 mg]

Tablet: Lipase 565 units, protease 8200 units, amylase 8200 units [pancreatin 325 mg]; lipase 2400 units, protease 30,000 units, amylase 30,000 units [pancreatin 1200 mg]

Hi-Vegi-Lip: Lipase 4800 units, protease 60,000 units, amylase 60,000 units [pancreatin 2400 mg; vegetable source]

Veg-Pancreatin 4X: Lipase 5500 units, protease 69,000 units, amylase 69,000 units [pancreatin 690 mg; vegetable source]

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Capsules (Dygase)

30-2.4-30 units (100): $69.99

Mechanism of ActionAn enzyme supplement, not a replacement, which contains a combination of lipase, amylase and protease. Enhances the digestion of proteins, starch and fat in the stomach and intestines.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Pharmacologic CategoryEnzyme

Use: Labeled IndicationsReplacement therapy in symptomatic treatment of malabsorption syndrome caused by pancreatic insufficiency

Use: Unlabeled/InvestigationalTreatment of occluded feeding tubes

Dosing: Adults

Malabsorption: Oral:

Powder: Actual dose depends on the condition being treated and the digestive requirements of the patient: 0.7 g ($^{1}/_{4}$ teaspoonful) with meals

Capsules/tablets: The following dosage recommendations are only an approximation for initial dosages. The actual dosage will depend on the condition being treated and the digestive requirements of the individual patient.

Note: Dosage adjustment: Adjust dose based on body weight and stool fat content. Total daily dose reflects ~3 meals/day and 2-3 snacks/day, with half the mealtime dose given with a snack. Older patients may need less units/kg due to increased weight, but decreased ingestion of fat/kg. Maximum dose: 2500 units of lipase/kg/meal (10,000 units of lipase/kg/day): 4000-48,000 units of lipase with meals and with snacks

Occluded feeding tubes (unlabeled use): One tablet of Viokase® crushed with one 325 mg tablet of sodium bicarbonate (to activate the Viokase®) in 5 mL of water can be instilled into the nasogastric tube and clamped for 5 minutes; then, flushed with 50 mL of tap water

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Malabsorption: Oral:

Powder: Actual dose depends on the condition being treated and the digestive requirements of the patient: Children <1 year: Start with $^{1}/_{8}$ teaspoonful with feedings

Capsules/tablets: Children: Approximate initial dosages; actual dosage will depend on the condition being treated and the digestive requirements of the individual patient.

<1 year: 2000 units of lipase with meals

1-6 years: 4000-8000 units of lipase with meals and 4000 units with snacks

7-12 years: 4000-12,000 units of lipase with meals and snacks

Note: Dosage adjustment: Adjust dose based on body weight and stool fat content. Total daily dose reflects ~3 meals/day and 2-3 snacks/day, with half the mealtime dose given with a snack.

Administration: OralOral: Administer with meals or snacks and swallow whole with a generous amount of liquid. Do not crush or chew; retention in the mouth before swallowing may cause mucosal irritation and stomatitis. Delayed-release capsules containing enteric-coated microspheres or microtablets may also be opened and the contents sprinkled on soft food with a low pH that does not require chewing, such as applesauce, gelatin; apricot, banana, or sweet potato baby food; baby formula. Dairy products such as milk, custard, or ice cream may have a high pH and should be avoided. Avoid inhalation of powder, may cause nasal and respiratory tract irritation.

Dietary ConsiderationsShould be used as part of a high-calorie diet, appropriate for age and clinical status. Administer with meals or snacks and swallow whole with a generous amount of liquid. Do not crush or chew. Delayed-release capsules containing enteric coated microspheres or microtablets may also be opened and the contents sprinkled on soft food with a low pH such as applesauce, gelatin; apricot, banana, or sweet potato baby food; baby formula. Dairy products such as milk, custard or ice cream may have a high pH and should be avoided.

StorageStore between 15°C to 25°C (59°F to 77°F); do not refrigerate. Keep in a dry place.

ContraindicationsHypersensitivity to pork protein or any component of the formulation; acute pancreatitis or acute exacerbations of chronic pancreatic disease

Warnings/Precautions

Concerns related to adverse effects:

- Fibrotic strictures: In the colon, fibrotic strictures (some requiring surgery) have been reported with high doses; use caution, especially in children with cystic fibrosis.

Dosage form specific issues:

- Brand interchangeability: Use caution when adjusting doses or changing brands.
- Capsules: Pancrelipase is inactivated by acids; do not crush or chew, some capsules may be opened and sprinkled on food.
- Powder: Avoid inhalation of powder; may cause nasal and respiratory tract irritation.

Geriatric ConsiderationsNo special considerations are necessary since drug is dosed to response; however, drug-induced diarrhea can result in unwanted side effects (eg, confusion, hypotension, lethargy, fluid and electrolyte loss).

Pregnancy Risk FactorB/C (product specific)

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsSystemic absorption and concentration in the breast milk is unlikely, but unknown.

Adverse ReactionsFrequency not defined; occurrence of events may be dose related.

Central nervous system: Pain

Dermatologic: Rash

Endocrine & metabolic: Hyperuricemia

Gastrointestinal: Nausea, cramps, constipation, diarrhea, perianal irritation/inflammation (large doses), irritation of the mouth, abdominal pain, intestinal obstruction, vomiting, flatulence, melena, weight loss, fibrotic strictures, greasy stools

Ocular: Lacrimation

Renal: Hyperuricosuria

Respiratory: Sneezing, dyspnea, bronchospasm

Miscellaneous: Allergic reactions

Drug InteractionsThere are no known significant interactions.

Ethanol/Nutrition/Herb InteractionsFood: Avoid placing contents of opened capsules on alkaline food (pH >5.5); pancrelipase may impair absorption of oral iron and folic acid.

Monitoring ParametersAbdominal symptoms, nutritional intake, growth (in children), stool character, fecal fat

Nursing: Physical Assessment/MonitoringDosing and administration depends on purpose for use. Use caution preparing powder. If powder spills on skin, wash off immediately. Do not inhale powder. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take right before or with foods and swallow whole with a generous amount of liquid. Dairy products, such as milk, custard, or ice cream, may have a high pH and should not taken together with this medication. Do not crush or chew tablets or regular capsules. Delayed-release capsules containing enteric coated microspheres or microtablets may be opened and the contents sprinkled on soft food with a low pH such as applesauce, gelatin, apricot, banana, or sweet potato baby food. **Powder:** If powder spills on skin, wash off immediately, do not inhale powder when preparing. You may experience some gastric discomfort. Report unusual rash, persistent GI upset; or respiratory difficulty. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule:

ku-zyme® HP: Lipase 8000 units, protease 30,000 units, and amylase 30,000 units [DSC]

Capsule, delayed release, enteric coated granules:

Pangestyme™ CN-10: Lipase 10,000 units, protease 37,500 units, amylase 33,200 units

Pangestyme™ CN-20: Lipase 20,000 units, protease 75,000 units, amylase 66,400 units

Pangestyme™ EC: Lipase 4500 units, protease 25,000 units, and amylase 20,000 units

Pangestyme™ MT16: Lipase 16,000 units, protease 48,000 units, and amylase 48,000 units

Pangestyme™ UL 12: Lipase 12,000 units, protease 39,000 units, and amylase 39,000 units

Pangestyme™ UL 18: Lipase 18,000 units, protease 58,500 units, and amylase 58,500 units

Pangestyme™ UL 20: Lipase 20,000 units, protease 65,000 units, and amylase 65,000 units

Capsule, delayed release, enteric coated microspheres: Lipase 4500 units, protease 25,000 units, and amylase 20,000 units

Creon® 5: Lipase 5000 units, protease 18,750 units, and amylase 16,600 units

Creon® 10, Palcaps 10: Lipase 10,000 units, protease 37,500 units, and amylase 33,200 units

Creon® 20, Palcaps 20: Lipase 20,000 units, protease 75,000 units, and amylase 66,400 units

Lipram 4500, Panocaps: Lipase 4500 units, protease 25,000 units, and amylase 20,000 units [DSC]

Lipram-CR10: Lipase 10,000 units, protease 37,500 units, and amylase 33,200 units [DSC]

Lipram-CR20: Lipase 20,000 units, protease 75,000 units, and amylase 66,400 units [DSC]

Lipram-PN10: Lipase 10,000 units, protease 30,000 units, and amylase 30,000 units [DSC]

Lipram-PN16, Panocap MT 16: Lipase 16,000 units, protease 48,000 units, and amylase 48,000 units [DSC]

Lipram-PN20, Panocap MT 20: Lipase 20,000 units, protease 44,000 units, and amylase 56,000 units [DSC]

Lipram-UL20, Ultracaps MT 20: Lipase 20,000 units, protease 65,000 units, and amylase 65,000 units [DSC]

Pancrecarb MS-4®: Lipase 4000 units, protease 25,000 units, and amylase 25,000 units [buffered]

Pancrecarb MS-8®: Lipase 8000 units, protease 45,000 units, and amylase 40,000 units [buffered]

Pancrecarb MS-16® Lipase 16,000 units, protease 52,000 units, and amylase 52,000 units [buffered]

Capsule, enteric coated microspheres:

Ultrase®: Lipase 4500 units, protease 25,000 units, and amylase 20,000 units

Capsule, enteric coated microtablets:

Pancrease® MT 4: Lipase 4000 units, protease 12,000 units, and amylase 12,000 units

Pancrease® MT 10: Lipase 10,000 units, protease 30,000 units, and amylase 30,000 units

Pancrease® MT 16: Lipase 16,000 units, protease 48,000 units, and amylase 48,000 units

Pancrease® MT 20: Lipase 20,000 units, protease 44,000 units, and amylase 56,000 units

Capsule, enteric coated minitablets:

Ultrase® MT12: Lipase 12,000 units, protease 39,000 units, and amylase 39,000 units

Ultrase® MT18: Lipase 18,000 units, protease 58,500 units, and amylase 58,500 units

Ultrase® MT20: Lipase 20,000 units, protease 65,000 units, and amylase 65,000 units

Powder (Viokase®): Lipase 16,800 units, protease 70,000 units, and amylase 70,000 units per 0.7 g (227 g)

Tablet: Lipase 8000 units, protease 30,000 units, and amylase 30,000 units

Panokase®: Lipase 8000 units, protease 30,000 units, and amylase 30,000 units [DSC]

Panokase® 16: Lipase 16,000 units, protease 60,000 units, and amylase 60,000 units [DSC]

Plaretase™ 8000: Lipase 8000 units, protease 30,000 units, and amylase 30,000 units

Viokase® 8: Lipase 8000 units, protease 30,000 units, and amylase 30,000 units

Viokase® 16: Lipase 16,000 units, protease 60,000 units, and amylase 60,000 units

Mechanism of ActionPancrelipase is a natural product harvested from the hog pancreas. It contains a combination of lipase, amylase, and protease. Products are formulated to dissolve in the more basic pH of the duodenum so that they may act locally to break down fats, protein, and starch.

Pharmacodynamics/Kinetics

Absorption: None; acts locally in GI tract

Excretion: Feces

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index Terms Lipancreatin

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Pancuronium may be confused with pipecuronium

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(pan kyoo ROE nee um)

Canadian Brand NamesPancuronium Bromide®

Pharmacologic CategoryNeuromuscular Blocker Agent, Nondepolarizing

Use: Labeled IndicationsAdjunct to general anesthesia to facilitate endotracheal intubation and to relax skeletal muscles during surgery; to facilitate mechanical ventilation in ICU patients; does not relieve pain or produce sedation

Drug of choice for neuromuscular blockade except in patients with renal failure, hepatic failure, or cardiovascular instability or in situations not suited for pancuronium's long duration of action

Dosing: AdultsAdminister I.V.; dose to effect; doses will vary due to interpatient variability; use ideal body weight for obese patients

Neuromuscular blockade: Initial: 0.06-0.1 mg/kg or 0.05 mg/kg after initial dose of succinylcholine for intubation; maintenance dose: 0.01 mg/kg 60-100 minutes after initial dose and then 0.01 mg/kg every 25-60 minutes

Pretreatment/priming: 10% of intubating dose given 3-5 minutes before initial dose

Neuromuscular blockade in the ICU: 0.05-0.1 mg/kg bolus followed by 0.8-1.7 mcg/kg/minute once initial recovery from bolus observed or 0.1-0.2 mg/kg every 1-3 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricInfants >1 month and Children: Refer to adult dosing.

Dosing: Renal ImpairmentElimination half-life is doubled, plasma clearance is reduced, and rate of recovery is sometimes much slower.

Cl_{cr} 10-50 mL/minute: Administer 50% of normal dose.

Cl_{cr} <10 mL/minute: Do not use.

Dosing: Hepatic ImpairmentElimination half-life is doubled, plasma clearance is doubled, recovery time is prolonged, volume of distribution is increased (50%) and results in a slower onset, higher total dosage, and prolongation of neuromuscular blockade. Patients with liver disease may develop slow resistance to nondepolarizing muscle relaxant. Large doses may be required and problems may arise in antagonism.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.May be administered undiluted by rapid I.V. injection.

Administration: I.V. DetailpH: 4 (adjusted)

StorageRefrigerate; however, stable for up to 6 months at room temperature.

CompatibilityStable in D_5NS, D_5W, LR, NS.

Y-site administration: Compatible: Aminophylline, cefazolin, cefuroxime, cimetidine, dobutamine, dopamine, epinephrine, esmolol, etomidate, fentanyl, fluconazole, gentamicin, heparin, hydrocortisone sodium succinate, isoproterenol, levofloxacin, lorazepam, midazolam, milrinone, morphine, nitroglycerin, ranitidine, sodium nitroprusside, trimethoprim/sulfamethoxazole, vancomycin. **Incompatible** Diazepam, thiopental. **Variable (consult detailed reference):** Propofol.

Compatibility in syringe: Compatible: Alcuronium, gallamine, heparin, hydrocortisone, meperidine, methohexital, neostigmine, opium alkaloids, promethazine, succinylcholine, thiopental, tubocurarine.

Compatibility when admixed: Compatible: Verapamil.

ContraindicationsHypersensitivity to pancuronium, bromide, or any component of the formulation

Allergy Considerations

- Neuromuscular-Blocking Agent Allergy

Warnings/Precautions

Boxed warnings:

- Experienced personnel: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Neuromuscular cross-sensitivity: Cross-sensitivity with other neuromuscular-blocking agents may occur; use extreme caution in patients with previous anaphylactic reactions.

Disease-related concerns:

- Burn injury: Resistance may occur in burn patients (>30% of body) for period of 5-70 days postinjury.

- Conditions which may antagonize neuromuscular blockade: Alkalosis, hypercalcemia, demyelinating lesions, peripheral neuropathies, denervation, infection, muscle trauma, and diabetes mellitus may result in antagonism of neuromuscular blockade.

- Conditions which may potentiate neuromuscular blockade: Electrolyte abnormalities, severe hyponatremia, severe hypocalcemia, severe hypokalemia, hypermagnesemia, neuromuscular diseases, acidosis, acute intermittent porphyria, Eaton-Lambert syndrome, myasthenia gravis, renal failure, and hepatic failure may result in potentiation of neuromuscular blockade.

- Hepatic impairment: Use with caution in patients with hepatic impairment; adjust dose appropriately.

- Renal impairment: Use with caution in patients with renal impairment; adjust dose appropriately.

Special populations:

- Elderly: Use with caution in the elderly, effects and duration are more variable.

- Immobilized patients: Resistance may occur in patients who are immobilized.

Other warnings/precautions:

- Appropriate use: Maintenance of an adequate airway and respiratory support is critical.

- Experienced personnel: **[U.S. Boxed Warning]: Should be administered by adequately trained individuals familiar with its use.**

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsFrequency not defined.

Cardiovascular: Elevation in pulse rate, elevated blood pressure and cardiac output, tachycardia, edema, skin flushing, circulatory collapse

Dermatologic: Rash, itching, erythema, burning sensation along the vein

Gastrointestinal: Excessive salivation

Neuromuscular & skeletal: Profound muscle weakness

Respiratory: Wheezing, bronchospasm

Miscellaneous: Hypersensitivity reaction

Postmarketing and/or case reports: Acute quadriplegic myopathy syndrome (prolonged use), myositis ossificans (prolonged use)

Causes of prolonged neuromuscular blockade: Excessive drug administration; cumulative drug effect, decreased metabolism/excretion (hepatic and/or renal impairment); accumulation of active metabolites; electrolyte imbalance (hypokalemia, hypocalcemia, hypermagnesemia, hypernatremia); hypothermia; drug interactions; increased sensitivity to muscle relaxants (eg, neuromuscular disorders such as myasthenia gravis or polymyositis)

Drug Interactions

Acetylcholinesterase Inhibitors: May diminish the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Aminoglycosides: May enhance the respiratory depressant effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Botulinum Toxin Type A: Neuromuscular-Blocking Agents may enhance the neuromuscular-blocking effect of Botulinum Toxin Type A. *Risk C: Monitor therapy*

Botulinum Toxin Type B: Neuromuscular-Blocking Agents may enhance the neuromuscular-blocking effect of Botulinum Toxin Type B. *Risk C: Monitor therapy*

Calcium Channel Blockers: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Cardiac Glycosides: Neuromuscular-Blocking Agents may enhance the arrhythmogenic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

Colistimethate: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Neuromuscular-Blocking Agents (Nondepolarizing) may enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

Inhalational Anesthetics: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Neuromuscular-Blocking Agents (Nondepolarizing). Specifically, episodes of apnea have been reported in patients using this combination. *Risk C: Monitor therapy*

Lincosamide Antibiotics: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Lithium: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Loop Diuretics: May diminish the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. Loop Diuretics may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Magnesium Salts: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. Only of concern in patients with increased serum magnesium concentrations. *Risk C: Monitor therapy*

Polymyxin B: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk D: Consider therapy modification*

Procainamide: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

QuiNIDine: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Tetracycline Derivatives: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Vancomycin: May enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Monitoring ParametersHeart rate, blood pressure, assisted ventilation status; cardiac monitor, blood pressure monitor, and ventilator required

Nursing: Physical Assessment/MonitoringOnly clinicians experienced in the use of neuromuscular blocking drugs should administer and/or manage the use of pancuronium. Dosage and rate of administration should be individualized and titrated to the desired effect, according to relevant clinical factors, premedication, concomitant medications, age, and general condition of the patient. Ventilatory support must be instituted and maintained until adequate respiratory muscle function and/or airway protection are assured. Assess other medications for effectiveness and safety. Other drugs that affect neuromuscular activity may increase/decrease neuromuscular block induced by pancuronium. This drug does not cause anesthesia or analgesia; pain must be treated with appropriate analgesic agents. Continuous monitoring of vital signs, cardiac status, respiratory status, and degree of neuromuscular block (objective assessment with peripheral external nerve stimulator) is mandatory and until full muscle tone has returned. Muscle tone returns in a predictable pattern, starting with diaphragm, abdomen, chest, limbs, and finally muscles of the neck, face, and eyes. Safety precautions must be maintained until full muscle tone has returned. **Note:** It may take longer for return of muscle tone in obese or elderly patients or patients with renal or hepatic disease, myasthenia gravis, myopathy, other neuromuscular disease, dehydration, electrolyte imbalance, or severe acid/base imbalance. Provide appropriate patient teaching/support prior to and following administration.

Long-term use: Monitor level of neuromuscular blockade, skeletal muscle movement, and respiratory effort. Reposition patient and provide appropriate skin care, mouth care, and care of patient's eyes every 2-3 hours while sedated. Provide appropriate emotional and sensory support (auditory and environmental).

Patient EducationPatient will usually be unconscious prior to administration. Patient education should be appropriate to individual situation. Reassurance of constant monitoring and emotional support to reduce fear and anxiety should precede and follow administration. Following return of muscle tone, do not attempt to change position or rise from bed without assistance. Report immediately any skin rash or hives, pounding heartbeat, respiratory difficulty, or muscle tremors. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as bromide: 1 mg/mL (10 mL); 2 mg/mL (2 mL, 5 mL) [may contain benzyl alcohol]

Generic AvailableYes

Mechanism of ActionBlocks neural transmission at the myoneural junction by binding with cholinergic receptor sites

Pharmacodynamics/Kinetics

Onset of effect: Peak effect: I.V.: 2-3 minutes

Duration (dose dependent): 60-100 minutes

Metabolism: Hepatic (30% to 45%); active metabolite 3-hydroxypancuronium ($^{1}/_{3}$ to $^{1}/_{2}$ the activity of parent drug)

Half-life elimination: 110 minutes

Excretion: Urine (55% to 70% as unchanged drug)

Related Information

- Neuromuscular-Blocking Agents

Pharmacotherapy PearlsPancuronium is classified as a long-duration neuromuscular-blocking agent. Neuromuscular blockade will be prolonged in patients with decreased renal function. Pancuronium does not relieve pain or produce sedation. It may produce cumulative effect on duration of blockade. It produces tachycardia secondary to vagolytic activity and sympathetic stimulation.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Anesthesia and Critical Care Concerns/Other ConsiderationsClassified as a long duration neuromuscular-blocking agent; neuromuscular blockade will be prolonged in patients with decreased renal function; may produce cumulative effect on duration of blockade; produces tachycardia secondary to vagolytic activity and sympathetic stimulation.

Critically-Ill Adult Patients:

The 2008 Surviving Sepsis Campaign guidelines recommend avoiding use of neuromuscular blockers if at all possible in the septic patient due to the risk of prolonged neuromuscular blockade following discontinuation. If one is required, monitor the depth of blockade (Grade 1B).

The 2002 ACCM/SCCM/ASHP clinical practice guidelines for sustained neuromuscular blockade in the adult critically-ill patient recommend:

Optimize sedatives and analgesics prior to initiation and monitor and adjust accordingly during course. Neuromuscular blockers do not relieve pain or produce sedation.

Protect patient's eyes from development of keratitis and corneal abrasion by administering ophthalmic ointment and taping eyelids closed or using eye patches. Reposition patient routinely to protect pressure points from breakdown. Address DVT prophylaxis.

Concurrent use of a neuromuscular blocker and corticosteroids appear to increase the risk of certain ICU myopathies; avoid or administer the corticosteroid at the lowest dose possible. Reassess need for neuromuscular blocker daily.

Using daily drug holidays (stopping neuromuscular-blocking agent until patient requires it again) may decrease the incidence of acute quadriplegic myopathy syndrome.

Tachyphylaxis can develop; switch to another neuromuscular blocker (taking into consideration the patient's organ function) if paralysis is still necessary.

Atracurium or cisatracurium is recommended for patients with significant hepatic or renal disease, due to organ-independent Hofmann elimination.

Monitor patients clinically and via “Train of Four” (TOF) testing with a goal of adjusting the degree of blockade to 1-2 twitches or based upon the patient's clinical condition.

Index TermsPancuronium Bromide; Pavulon [DSC]

Canadian Brand NamesVectibix®

Pharmacologic CategoryAntineoplastic Agent, Monoclonal Antibody; Epidermal Growth Factor Receptor (EGFR) Inhibitor

Use: Labeled IndicationsMonotherapy in treatment of refractory metastatic colorectal cancer

Dosing: Adults**Metastatic colorectal cancer:** I.V.: 6 mg/kg every 2 weeks

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentHas not been studied

Dosing: Hepatic ImpairmentHas not been studied

Dosing: Adjustment for Toxicity

Infusion reactions, mild-to-moderate (grade 1 or 2): Reduce the infusion rate by 50% for the duration of infusion

Infusion reactions, severe (grade 3 or 4): Immediately and permanently discontinue treatment

Dermatologic toxicity (grade 3 or 4, or intolerable): Withhold treatment; if skin toxicity does not improve to ≤ grade 2 within 1 month, permanently discontinue. If skin toxicity improves to ≤ grade 2 within 1 month (with patient missing ≤2 doses), resume treatment at 50% of the original dose. Dose may be increased in increments of 25% of the original dose (up to 6 mg/kg) if skin toxicities do not recur. For recurrent skin toxicity, permanently discontinue.

Administration: I.V.Doses ≤1000 mg, infuse over 1 hour; doses >1000 mg, infuse over 90 minutes; reduce infusion rate by 50% for mild-to-moderate infusion reactions; discontinue for severe infusion reactions. Administer through a low protein-binding 0.2 or 0.22 micrometer in-line filter. Flush with NS before and after infusion.

Administration: I.V. DetailpH: 5.6-6; may contain a small amount of visible transparent or white, amorphous panitumumab particles

StorageStore unopened vials under refrigeration at 2°C to 8°C (36°F to 46°F). Do not freeze; do not shake; protect from light. Preparations in infusion containers are stable for 24 hours under refrigeration at 2°C to 8°C (36°F to 46°F) or for 6 hours at room temperature (do not freeze).

Reconstitution Dilute in 100-150 mL of normal saline to a final concentration of ≤10 mg/mL. Do not shake, invert gently to mix.

ContraindicationsThere are no contraindications listed in manufacturer's labeling.

Warnings/Precautions

Boxed warnings:

- Dermatologic toxicity: See “Concerns related to adverse effects” below.

- Infusion reactions: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Dermatologic toxicity: **[U.S. Boxed Warning]: Dermatologic toxicities have been reported in ~90% of patients (severe in 12% of patients);** may include dermatitis acneiform, pruritus, erythema, rash, skin exfoliation, paronychia, dry skin and skin fissures. Severe skin toxicities may be complicated by infection, sepsis, or abscesses. The median time to development of skin (or ocular) toxicity was 2 weeks, with resolution ~7 weeks after discontinuation. The severity of dermatologic toxicity is predictive for response; grades 2-4 skin toxicity correlates with improved progression free survival and overall survival, compared to grade 1 skin toxicity (Van Cutsem, 2007). Withhold treatment (and monitor) for severe or life-threatening dermatologic toxicities; may require dose reduction or permanent discontinuation. Patients should minimize sunlight exposure; may exacerbate skin reactions. Gastric mucosal, ocular and nail toxicities have also been reported.

- Diarrhea: May cause diarrhea; the incidence and severity of chemotherapy-induced diarrhea is increased with combination chemotherapy. Due to the potential for severe diarrhea and other toxicities, use with combination chemotherapy regimens is not recommended.

- Electrolyte depletion: May occur during treatment and after treatment is discontinued; monitor for hypomagnesemia and hypocalcemia.

- Infusion reactions: **[U.S. Boxed Warning]: Severe infusion reactions (anaphylactic reaction, bronchospasm, fever, chills, and hypotension) have been reported in ~1% of patients.** Discontinue infusion for severe reactions; permanently discontinue in patients with persistent severe infusion reactions. Appropriate medical support for the management of infusion reactions should be readily available. Mild to moderate infusion reactions are managed by slowing the infusion rate.

- Pulmonary fibrosis: Has been reported (rarely); permanently discontinue treatment if interstitial lung disease, pneumonitis or lung infiltrates develop. Use caution with lung disease; patients with underlying lung disease were excluded from clinical trials.

Concurrent drug therapy issues:

- Combination chemotherapy: Studies using panitumumab in combination with chemotherapy (with or without bevacizumab) resulted in decreased progression-free survival and significantly increased toxicity compared to regimens without panitumumab. Toxicities included rash, diarrhea/dehydration, electrolyte disturbances, stomatitis, and an increased incidence of pulmonary embolism. Panitumumab is not indicated for use in combination with chemotherapy.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproductive studies have demonstrated adverse fetal effects. Based on animal studies, panitumumab may disrupt normal menstrual cycles. There are no adequate and well-controlled studies in pregnant women. IgG is known to cross the placenta; therefore, it is possible the developing fetus may be exposed to panitumumab. Because panitumumab inhibits epidermal growth factor (EGF), a component of fetal development, adverse effects on pregnancy would be expected. Panitumumab should only be given to a pregnant woman if the potential benefit justifies the potential risk to the fetus. Women of childbearing potential should use effective contraception during and for 6 months after treatment. Women who become pregnant during panitumumab treatment are encouraged to enroll in Amgen’s Pregnancy Surveillance Program (1-800-772-6436).

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsBreast-feeding should be discontinued during treatment and for 2 months following the last dose.

Adverse Reactions

>10%:

Cardiovascular: Peripheral edema (12%)

Central nervous system: Fatigue (26%)

Dermatologic: Skin toxicity (90%; grades 3/4: 16%), erythema (65%; grades 3/4: 5%), acneiform rash (57%; grades 3/4: 7%), pruritus (57%; grades 3/4: 2%), exfoliation (25%; grades 3/4: 2%), paronychia (25%), rash (22%; grades 3/4: 1%), fissures (20%; grades 3/4: 1%), acne (13%; grades 3/4: 1%)

Endocrine & metabolic: Hypomagnesemia (38%; grades 3/4: 4%)

Gastrointestinal: Abdominal pain (25%), nausea (23%), diarrhea (21%; grades 3/4: 2%), constipation (21%), vomiting (19%)

Respiratory: Cough (14%)

1% to 10%:

Dermatologic: Dry skin (10%), nail disorder (other than paronychia: 9%)

Gastrointestinal: Stomatitis (7%), mucositis (6%)

Ocular: Eyelash growth (6%), conjunctivitis (4%), ocular hyperemia (3%), lacrimation increased (2%), eye/eye lid irritation (1%)

Miscellaneous: Antibody formation (≤5%), infusion reactions (3%; grades 3/4: 1%)

<1%, postmarketing, and/or case reports: Allergic reaction, anaphylactoid reaction, chills, dyspnea, fever, hypocalcemia, hypoxia, pulmonary embolism, pulmonary fibrosis, pulmonary infiltrate

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersKRAS genotyping of tumor tissue. Monitor serum electrolytes, including magnesium and calcium (periodically during and for at least 8 weeks after therapy). Monitor vital signs and temperature before, during, and after infusion. Monitor for skin toxicity.

Nursing: Physical Assessment/MonitoringPatient must be monitored closely during and following infusion for infusion reaction (appropriate medical support for the management of infusion reactions should be readily available). Assess results of laboratory tests, therapeutic effectiveness, and adverse response (severe skin reactions can occur 2-7 weeks [may necessitate dose reduction]; peripheral edema; gastrointestinal upset [pain, nausea, diarrhea, constipation, vomiting]) at each infusion and throughout therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsKRAS genotyping of tumor tissue. Monitor serum electrolytes, including magnesium and calcium (periodically during and for at least 8 weeks after therapy).

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication can only be administered by infusion; you will be closely monitored during infusion; report immediately unusual back or abdominal pain, acute headache, difficulty breathing or chest tightness, difficulty swallowing, itching or rash, redness, swelling, or pain at infusion site. Maintain adequate hydration (2-3 L/day of fluids, unless instructed to restrict fluid intake) and nutrition (small, frequent meals). You may experience nausea or vomiting (frequent oral care, sucking lozenges, or chewing gum may help); or diarrhea (buttermilk, boiled milk, or yogurt may help); constipation (increased dietary fiber may help). Report immediately any skin rash, redness, or infection; any unusual swelling of extremities or weight gain (>5 pounds in any week); unremitting abdominal pain, vomiting, diarrhea, or constipation; any changes in vision; unusual infection (respiratory or wound), or any other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant while taking this medication. Consult prescriber for use appropriate contraceptive measures (may cause fetal defects). Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Vectibix®: 20 mg/mL (5 mL, 10 mL, 20 mL)

Generic AvailableNo

ManufacturerAmgen, Inc

Pricing: U.S. (www.drugstore.com)

Solution (Vectibix)

100 mg/5 mL (5): $926.90

200 mg/10 mL (10): $1853.79

400 mg/20 mL (20): $4222.59

Mechanism of ActionRecombinant human IgG2 monoclonal antibody which binds specifically to the epidermal growth factor receptor (EGFR, HER1, c-ErbB-1) and competitively inhibits the binding of epidermal growth factor (EGF) and other ligands. Binding to the EGFR blocks phosphorylation and activation of intracellular tyrosine kinases, resulting in inhibition of cell survival, growth, proliferation and transformation.

Pharmacodynamics/KineticsHalf-life elimination: ~7.5 days (range: 4-11 days)

Pharmacotherapy Pearls**Oncology Comment:** The National Comprehensive Cancer Network® (NCCN) guidelines for colon cancer (v.4.2008) recommend genotyping tumor tissue for KRAS mutation in all patients with metastatic colorectal cancer (genotyping may be done on archived specimens). Patients with known codon 12 or 13 KRAS gene mutations are unlikely to respond to EGFR inhibitors and should not receive panitumumab. Favorable progression-free survival and higher response rates have been demonstrated with panitumumab in patients with KRAS wild-type; patients with the KRAS mutation did not respond to panitumumab (Amado, 2008). Because EGFR testing in colorectal tumors does not correlate with response, the NCCN guidelines do not recommend routine EGFR testing in colorectal cancer. Severity of dermatologic toxicity associated with panitumumab is predictive for response; grades 2-4 skin toxicity correlates with improved progression free survival and overall survival, compared to patients with grade 1 skin toxicity (Van Cutsem, 2007). The NCCN guidelines do not recommend the use of panitumumab after failure of cetuximab therapy.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis and mucositis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusFatigue is common

Mental Health: Effects on Psychiatric TreatmentGI side effects are common; concomitant use with lithium, valproic acid, carbamazepine, and SSRIs may produce additive effects

Clopidogrel (Plavix®) and Proton Pump Inhibitors (PPIs): Ongoing Safety Review - January 2009

The U.S. Food and Drug Administration (FDA) is communicating important information regarding an ongoing safety review of clopidogrel and its effectiveness when used with proton pump inhibitors (PPIs).

Clopidogrel is a prodrug requiring hepatic conversion via CYP3A4 and/or CYP2C19 to its active metabolite. Impaired clopidogrel conversion to its active metabolite may be due to either CYP450 polymorphisms or drug-drug interactions resulting in suboptimal antiplatelet activity.

A PPI is often prescribed with the combination of aspirin and clopidogrel to prevent gastrointestinal bleeding. A number of PPIs are available and include esomeprazole, lansoprazole, omeprazole, pantoprazole, and rabeprazole. Several studies have reported greater clinical event rates (eg, myocardial infarction, death) or greater platelet reactivity associated with concurrent use of clopidogrel and a PPI (Ho, 2008; Pezella, 2008; Gilard, 2006). Similarly, a prospective, randomized, double-blind trial demonstrated a reduction in antiplatelet activity when omeprazole and clopidogrel are used concurrently (Gilard, 2008). Another controlled trial with the PPI lansoprazole also found evidence of a possible interaction resulting in less antiplatelet activity (Small, 2008). This interaction is thought to result from competitive inhibition of the CYP2C19-mediated activation of clopidogrel by omeprazole and other PPIs, which are all metabolized to at least some degree by CYP2C19. In contrast, one study with esomeprazole and pantoprazole did not find evidence of reduced antiplatelet activity when administered with clopidogrel (Siller-Matula, 2009), highlighting the need for additional studies to determine the degree to which individual PPIs may differ in their potential for interacting with clopidogrel.

The manufacturer of Plavix® has agreed to conduct further studies to better understand the effect of other drugs (including PPIs) and genetic factors on the effectiveness of clopidogrel. The FDA is recommending that healthcare providers continue to prescribe clopidogrel while reevaluating the need for prescription or over-the-counter (OTC) PPIs in patients taking clopidogrel. Patients should continue taking clopidogrel as directed. If taking a PPI with clopidogrel, patients should consult with their healthcare provider.

For more information, healthcare professionals may refer to the following FDA website: http://www.fda.gov/cder/drug/early_comm/clopidogrel_bisulfate.htm

Medication Safety Issues

Sound-alike/look-alike issues:

Protonix® may be confused with Lotronex®, Lovenox®, protamine

Vials containing Protonix® I.V. for injection are not recommended for use with spiked I.V. system adaptors. Nurses and pharmacists have reported breakage of the glass vials during attempts to connect spiked I.V. system adaptors, which may potentially result in injury to healthcare professionals.

International issues:

Protonix® may be confused with Pretanix® which is a brand name for indapamide in Hungary

Pronunciation(pan TOE pra zole)

U.S. Brand NamesProtonix®

Canadian Brand NamesApo-Pantoprazole; Co-Pantoprazole; Gen-Pantoprazole; Novo-Pantoprazole; Pantoloc®; Pantoloc® M; Panto™ I.V.; PMS-Pantoprazole; Protonix®; Ran-Pantoprazole; Ratio-Pantoprazole; Riva-Pantoprazole; Sandoz-Pantoprazole; Tecta™

Pharmacologic CategoryProton Pump Inhibitor; Substituted Benzimidazole

Use: Labeled Indications

Oral: Treatment and maintenance of healing of erosive esophagitis associated with GERD; reduction in relapse rates of daytime and nighttime heartburn symptoms in GERD; hypersecretory disorders associated with Zollinger-Ellison syndrome or other GI hypersecretory disorders

I.V.: Short-term treatment (7-10 days) of patients with gastroesophageal reflux disease (GERD) and a history of erosive esophagitis; hypersecretory disorders associated with Zollinger-Ellison syndrome or other neoplastic disorders

Use: Unlabeled/InvestigationalPeptic ulcer disease, active ulcer bleeding (parenteral formulation); adjunct treatment with antibiotics for *Helicobacter pylori* eradication; stress-ulcer prophylaxis in the critically-ill

Dosing: Adults

Erosive esophagitis associated with GERD:

Oral:

Treatment: 40 mg once daily for up to 8 weeks; an additional 8 weeks may be used in patients who have not healed after an 8-week course

Maintenance of healing: 40 mg once daily

Note: Lower doses (20 mg once daily) have been used successfully in mild GERD treatment and maintenance of healing

I.V.: 40 mg once daily for 7-10 days

Peptic ulcer disease: Eradication of *Helicobacter pylori* (unlabeled use): Oral: Doses up to 40 mg twice daily have been used as part of combination therapy

Hypersecretory disorders (including Zollinger-Ellison):

Oral: Initial: 40 mg twice daily; adjust dose based on patient needs; doses up to 240 mg/day have been administered

I.V.: 80 mg twice daily; adjust dose based on acid output measurements; 160-240 mg/day in divided doses has been used for a limited period (up to 7 days)

Prevention of rebleeding in peptic ulcer bleed (unlabeled use): I.V.: 80 mg, followed by 8 mg/hour infusion for 72 hours. **Note:** A daily infusion of 40 mg does not raise gastric pH sufficiently to enhance coagulation in active GI bleeds.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**GERD, erosive esophagitis associated with GERD:**

Oral:

Children <5 years: Dosage not established.

Children ≥5 years (unlabeled use): 20-40 mg once daily

I.V.: Dosage not established

Dosing: Renal ImpairmentNo adjustment is required. Pantoprazole is not removed by hemodialysis.

Dosing: Hepatic ImpairmentNo adjustment is required.

Administration: I.V.Flush I.V. line before and after administration. In-line filter not required.

2-minute infusion: The volume of reconstituted solution (4 mg/mL) to be injected may be administered intravenously over at least 2 minutes.

15-minute infusion: Infuse over 15 minutes at a rate not to exceed 7 mL/minute (3 mg/minute).

Administration: Oral

Tablet: Should be swallowed whole, do not crush or chew. Best if taken before breakfast.

Delayed-release oral suspension: Should only be administered in apple juice or applesauce and taken ~30 minutes before a meal. Do not administer with any other liquid (eg, water) or foods.

Oral administration in **applesauce**: Sprinkle intact granules on 1 tablespoon of applesauce and swallow within 10 minutes of preparation.

Oral administration in **apple juice**: Empty intact granules into 5 mL of apple juice (~1 teaspoonful), stir for 5 seconds, and swallow immediately after preparation. Rinse container once or twice with apple juice and swallow immediately.

Nasogastric tube administration: Separate the plunger from the barrel of a 60 mL catheter tip syringe and connect to a ≥16 French nasogastric tube. Holding the syringe attached to the tubing as high as possible, empty the contents of the packet into barrel of the syringe, add 10 mL of apple juice and gently tap/shake the barrel of the syringe to help empty the syringe. Add an additional 10 mL of apple juice and gently tap/shake the barrel to help rinse. Repeat rinse with at least 2 -10 mL aliquots of apple juice. No granules should remain in the syringe.

Dietary Considerations

Oral: May be taken with or without food; best if taken before breakfast.

I.V.: Due to EDTA in preparation, zinc supplementation may be needed in patients prone to zinc deficiency.

Storage

Oral: Store tablet and oral suspension at controlled room temperature of 20°C to 25°C (68°F to 77°F).

I.V.: Prior to reconstitution, store at controlled room temperature of 20°C to 25°C (68°F to 77°F). Protect from light. When reconstituted, solution is stable up to 96 hours at room temperature (Johnson, 2005). The preparation should be stored at 3°C to 5°C (37°F to 41°F) if it is stored beyond 48 hours to minimize discoloration. If further diluting in 100 mL of D_5W, LR, or NS, dilute within 6 hours of reconstitution. Diluted solution is stable at room temperature for up to 24 hours from the time of initial reconstitution; protection from light is not required.

ReconstitutionReconstitute with 10 mL NS (final concentration 4 mg/mL). Reconstituted solution may be given intravenously (over 2 minutes) or may be added to 100 mL D_5W, NS, or LR (for 15-minute infusion).

CompatibilityStable in D_5W, LR, NS.

Y-site administration: Incompatible: Midazolam, zinc.

Extemporaneously PreparedA 2 mg/mL pantoprazole oral liquid can be prepared with twenty pantoprazole 40 mg tablets, 340 mL sterile water, and 33.6 g of sodium bicarbonate powder. Remove the Protonix® imprint from each of the tablets on a paper towel dampened with ethanol (improves the look of product). Let tablets air dry. Grind the tablets into a coarse powder, transfer to a 600 mL beaker and add 340 mL of sterile water for irrigation and place beaker on a magnetic stirrer. Add 16.8 g of sodium bicarbonate powder and stir for about 20 minutes until the tablet remnants have disintegrated. While stirring, add another 16.8 g of sodium bicarbonate powder and stir for about 5 minutes until powder has dissolved. Add enough sterile water for irrigation to bring the final volume to 400 mL. Mix well. Transfer to amber-colored bottle. Stable for 62 days under refrigeration. Shake well before use.

Dentinger PJ, Swenson CF, and Anaizi NH, "Stability of Pantoprazole in an Extemporaneously Compounded Oral Liquid," *Am J Health Syst Pharm*, 2002, 59:953-6.

ContraindicationsHypersensitivity to pantoprazole, substituted benzamidazoles (eg, esomeprazole, lansoprazole, omeprazole, rabeprazole), or any component of the formulation

Allergy Considerations

- Proton Pump Inhibitor, Benzimidazole Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Atrophic gastritis: Long-term pantoprazole therapy (especially in patients who were *H. pylori* positive) has caused biopsy-proven atrophic gastritis.
- Carcinoma: No occurrences of enterochromaffin-like (ECL) cell carcinoids, dysplasia, or neoplasia, such as those seen in rodent studies, have been reported in humans.
- Vitamin B_{12} malabsorption: Prolonged treatment (typically >3 years) may lead to vitamin B_{12} malabsorption and subsequent deficiency.

Disease-related concerns:

- Gastric malignancy: Relief of symptoms does not preclude the presence of a gastric malignancy.
- Gastrointestinal infection (eg, *Salmonella, Campylobacter*): Use of proton pump inhibitors may increase risk of these infections.

Dosage form specific issues:

- Edetate sodium (EDTA): Intravenous preparation contains edetate sodium; use caution in patients who are at risk for zinc deficiency if other EDTA-containing solutions are coadministered.

Geriatric ConsiderationsDosage adjustment not required.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Use in pregnancy only if clearly needed.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsNot recommended due to carcinogenicity in animal studies.

Adverse Reactions

≥1%:

Cardiovascular: Chest pain

Central nervous system: Headache (2% to 9%), insomnia (≤1%), anxiety, dizziness, migraine

Dermatologic: Rash (≤2%)

Endocrine & metabolic: Hyperglycemia (≤1%), hyperlipidemia

Gastrointestinal: Diarrhea (2% to 6%), flatulence (2% to 4%), abdominal pain (1% to 4%), nausea (≤2%), vomiting (≤2%), eructation (≤1%), constipation, dyspepsia, gastroenteritis, rectal disorder

Genitourinary: Urinary frequency, UTI

Hepatic: Liver function tests abnormal (≤2%)

Local: Injection site reaction (includes thrombophlebitis and abscess)

Neuromuscular & skeletal: Arthralgia, back pain, hypertonia, neck pain, weakness

Respiratory: Bronchitis, cough, dyspnea, pharyngitis, rhinitis, sinusitis, upper respiratory tract infection

Miscellaneous: Flu syndrome, infection, pain

<1%, postmarketing, and/or case reports: Abnormal dreams, acne, albuminuria, alkaline phosphatase increased, allergic reaction, alopecia, anaphylaxis, anemia, angioedema, angina pectoris, anorexia, aphthous stomatitis, appetite increased, arrhythmia, asthma exacerbation, atrial fibrillation/flutter, atrophic gastritis, balanitis, biliary pain, blurred vision, bone pain, breast pain, bursitis, cataract, CHF, chills, cholecystitis, cholelithiasis, CPK increased, colitis, confusion, contact dermatitis, creatinine increased, cystitis, deafness, decreased reflexes, dehydration, depression, diabetes mellitus, diaphoresis, diplopia, duodenitis, dysarthria, dysmenorrhea, dysphagia, dysuria, ecchymosis, ECG abnormality, eczema, eosinophilia, epididymitis, epistaxis, erythema multiforme, esophagitis, extraocular palsy, facial edema, fever, fungal dermatitis, gastrointestinal carcinoma, gastrointestinal hemorrhage, gastrointestinal moniliasis, generalized edema, GGT increased, gingivitis, glaucoma, glossitis, glycosuria, goiter, gout, halitosis, hallucinations, heat stroke, hematemesis, hematuria, hemorrhage, hepatic failure, hepatitis, hernia, herpes simplex, herpes zoster, hiccup, hyperbilirubinemia, hyperesthesia, hyper-/hypotension, hyperkinesia, hyperuricemia, hypokinesia, impaired urination, impotence, interstitial nephritis, jaundice, kidney calculus, kidney pain, laryngitis, leg cramps, leukocytosis, leukopenia, libido decreased, lichenoid dermatitis, maculopapular rash, malaise, melena, mouth ulceration, myalgia, myocardial infarction, myocardial ischemia, neoplasm, nervousness, neuralgia, neuritis, nocturia, optic neuropathy (including anterior ischemic), otitis externa, palpitation, pancreatitis, pancytopenia, paresthesia, periodontal abscess, periodontitis, photosensitivity, pneumonia, pruritus, pyelonephritis, rectal hemorrhage, retinal vascular disorder, rhabdomyolysis, salivation increased, scrotal edema, seizure, skin ulcer, somnolence, Stevens-Johnson syndrome, stomach ulcer, stomatitis, syncope, tachycardia, taste perversion, tenosynovitis, thrombocytopenia, thrombosis, tinnitus, tongue discoloration, toxic epidermal necrolysis, tremor, urethral pain, urethritis, urticaria, vaginitis, vasodilation, vertigo, vision abnormal, weight changes, xerostomia

Metabolism/Transport Effects**Substrate** of CYP2C19 (major), 2C9 (minor), 2D6 (minor), 3A4 (minor); **Inhibits** 2C9 (weak); **Induces** CYP1A2 (weak), 3A4 (weak)

Drug Interactions

Atazanavir: Proton Pump Inhibitors may decrease the absorption of Atazanavir. *Risk D: Consider therapy modification*

Clopidogrel: Proton Pump Inhibitors may diminish the therapeutic effect of Clopidogrel. This appears to be due to reduced formation of the active clopidogrel metabolite. *Risk C: Monitor therapy*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

Dabigatran Etexilate: Proton Pump Inhibitors may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Dasatinib: Proton Pump Inhibitors may decrease the absorption of Dasatinib. *Risk D: Consider therapy modification*

Erlotinib: Proton Pump Inhibitors may decrease the serum concentration of Erlotinib. *Risk X: Avoid combination*

Fluconazole: May increase the serum concentration of Proton Pump Inhibitors. *Risk C: Monitor therapy*

Indinavir: Proton Pump Inhibitors may decrease the serum concentration of Indinavir. *Risk C: Monitor therapy*

Iron Salts: Proton Pump Inhibitors may decrease the absorption of Iron Salts. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk C: Monitor therapy*

Itraconazole: Proton Pump Inhibitors may decrease the serum concentration of Itraconazole. *Risk D: Consider therapy modification*

Ketoconazole: Proton Pump Inhibitors may decrease the serum concentration of Ketoconazole. Ketoconazole may increase the serum concentration of Proton Pump Inhibitors. *Risk D: Consider therapy modification*

Mesalamine: Proton Pump Inhibitors may diminish the therapeutic effect of Mesalamine. This appears to be formulation-related and specific to the Apriso brand of mesalamine. Management: One specific formulation of mesalamine (i.e., Apriso-brand capsules containing coated granules) should not be administered with antacids; proton pump inhibitors would be expected to interact in a similar manner. *Risk X: Avoid combination*

Methotrexate: Proton Pump Inhibitors may decrease the excretion of Methotrexate. Antirheumatic doses of methotrexate probably hold minimal risk. *Risk C: Monitor therapy*

Mycophenolate: Proton Pump Inhibitors may decrease the serum concentration of Mycophenolate. Specifically, concentrations of the active mycophenolic acid may be reduced. *Risk C: Monitor therapy*

Nelfinavir: Proton Pump Inhibitors may decrease serum concentrations of the active metabolite(s) of Nelfinavir. Proton Pump Inhibitors may decrease the serum concentration of Nelfinavir. *Risk X: Avoid combination*

Saquinavir: Proton Pump Inhibitors may increase the serum concentration of Saquinavir. *Risk C: Monitor therapy*

Tipranavir: May decrease the serum concentration of Proton Pump Inhibitors. These data are derived from studies with Ritonavir-boosted Tipranavir. *Risk C: Monitor therapy*

Topotecan: BCRP/ABCG2 Inhibitors may increase the serum concentration of Topotecan. *Risk D: Consider therapy modification*

Voriconazole: Proton Pump Inhibitors may increase the serum concentration of Voriconazole. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may cause gastric mucosal irritation).

Herb/Nutraceutical: Prolonged treatment (typically >3 years) may lead to vitamin B_{12} malabsorption and subsequent deficiency.

Test InteractionsFalse-positive urine screening tests for tetrahydrocannabinol (THC) have been noted in patients receiving proton pump inhibitors, including pantoprazole.

Monitoring ParametersHypersecretory disorders: Acid output measurements, target level <10 mEq/hour (<5 mEq/hour if prior gastric acid-reducing surgery)

Nursing: Physical Assessment/MonitoringAssess other medications for effectiveness and interactions (cytochrome P450 enzyme substrate), especially those drugs where absorption is determined by an acidic gastric pH. Monitor therapeutic effectiveness and adverse effects at beginning of therapy and regularly with long-term use. Assess knowledge/teach patient appropriate use, possible side effects/interventions, and adverse symptoms to report.

Patient EducationTake as directed; do not alter dosage without consulting prescriber. Take at similar time each day. Swallow tablet whole (do not crush or chew). Avoid alcohol. You may experience dizziness, headache, or anxiety (use caution when driving or engaging in dangerous activities until response to medication is known); vomiting or loss of appetite (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or diarrhea (boiled milk, yogurt, or buttermilk may help). Report persistent abdominal discomfort; chest pain or palpitations; acute headache; unresolved diarrhea; excessive fatigue; increased muscle, joint, or body pain; shortness of breath or wheezing; cold or flu symptoms; changes in urinary pattern; or other persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Note: Strength expressed as base

Granules for suspension, delayed release, enteric coated, as sodium, oral:

Protonix®: 40 mg/packet (30s)

Injection, powder for reconstitution, as sodium:

Protonix®: 40 mg [contains edetate sodium 1 mg]

Tablet, delayed release, as sodium: 20 mg, 40 mg

Protonix®: 20 mg, 40 mg

Tablet, enteric coated, as magnesium:

Pantoloc® M [CAN]: 40 mg [not available in the U.S.]

Generic AvailableYes: Delayed release tablet

ManufacturerWyeth-Ayerst Laboratories

Pricing: U.S. (www.drugstore.com)

Tablet, EC (Pantoprazole Sodium)

20 mg (30): $109.99

40 mg (90): $324.98

Tablet, EC (Protonix)

20 mg (30): $134.03

40 mg (30): $132.03

Mechanism of ActionSuppresses gastric acid secretion by inhibiting the parietal cell H^+/K^+ ATP pump

Pharmacodynamics/Kinetics

Absorption: Rapid, well absorbed

Distribution: V_d: 11-24 L

Protein binding: 98%, primarily to albumin

Metabolism: Extensively hepatic; CYP2C19 (demethylation), CYP3A4; no evidence that metabolites have pharmacologic activity

Bioavailability: 77%

Half-life elimination: 1 hour; increased to 3.5-10 hours with CYP2C19 deficiency

Time to peak: Oral: 2.5 hours

Excretion: Urine (71%); feces (18%)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause anxiety or dizziness; may rarely produce confusion, depression, dysarthria, hallucinations, nervousness, or somnolence

Mental Health: Effects on Psychiatric TreatmentNone reported

Anesthesia and Critical Care Concerns/Other Considerations

Evidence-Based Information:

Acute ulcer: Pre-endoscopy therapy: Lau and associates (2007) evaluated the effects of preemptive infusion of omeprazole before endoscopy in upper gastrointestinal bleeding. Consecutive patients (n=638) were stabilized and then randomly assigned to intravenous omeprazole (80 mg bolus followed by a continuous infusion of 8 mg/hour) or placebo infusion before endoscopy the next morning. The primary endpoint was the need for endoscopic therapy (eg, epinephrine, thermocoagulation). Seven patients were excluded from the analysis. The need for endoscopic treatment was significantly lower in the omeprazole group (60/314 patients; 19%) than in the placebo group (90/317; 28%). The active treatment group had a significantly shorter hospital stay. Duration of infusion before endoscopy was similar in both groups (~8-21 hours).

Acute ulcer: Postendoscopy therapy: Intravenous omeprazole has been studied in prevention of rebleeding in ulcer patients who are at high risk for rebleeding (endoscopic findings of active bleeding or nonbleeding visible vessel) after successful hemostasis (Lin, 1998; Lau, 2000). Lin and his group treated 100 ulcer patients (actively bleeding ulcers or ulcers with nonbleeding visible vessels) endoscopically and then randomized them to cimetidine (300 mg bolus followed by 50 mg/hour infusion) or omeprazole (40 mg bolus, ~7 mg/hour infusion) for 72 hours. Patients were discharged on the oral form of the drug arm they were assigned to. The omeprazole group maintained an intragastric pH >6 for about 84% of the infusion duration, while the cimetidine group maintained their pH >6 only about 50% of the time. Rebleeding occurred significantly more often in the cimetidine group.

Lau and his colleagues treated patients with actively bleeding ulcers or ulcers with nonbleeding visible vessels with an epinephrine infusion followed by thermocoagulation. They were then randomized to omeprazole (80 mg bolus followed by a continuous infusion of 8 mg/hour for 72 hours) or placebo. All patients were discharged on oral omeprazole (20 mg/day) for 8 weeks and received *H. pylori* treatment if indicated. The primary goal was to evaluate the rate of rebleeding during the first 30 days after endoscopy. Two hundred and forty patients were enrolled with randomization of 120 into each group. Bleeding recurred in significantly more patients receiving placebo than omeprazole infusion. The authors concluded that after endoscopic therapy, omeprazole reduces the risk of rebleeding in patients with actively bleeding ulcers or ulcers with nonbleeding visible vessels.

Stress ulcer prophylaxis: The 2008 Surviving Sepsis Campaign guidelines recommend that stress ulcer prophylaxis using an H_2 blocker (Grade 1A) or proton pump inhibitor (Grade 1B) be given to patients with severe sepsis to prevent upper GI bleed. Benefit of prevention of upper GI bleed must be weighed against potential effect of increased stomach pH on development of ventilator-associated pneumonia.

Jump To Field (Select Field Name)

Pronunciation(pan toe THEN ik AS id)
U.S. Brand NamesPanto-250
Pharmacologic CategoryVitamin, Water Soluble
Use: Labeled IndicationsPantothenic acid deficiency
Dosing: Adults**Dietary deficiency:** Oral: Recommended daily dose 4-7 mg/day
Dosing: ElderlyRefer to adult dosing.
Pregnancy Risk FactorA/C (dose exceeding RDA recommendation)
Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Panto-250: 250 mg [contains calcium 23 mg]

Liquid: 200 mg/5 mL (240 mL)

Tablet: 100 mg, 200 mg, 250 mg, 500 mg

Tablet, sustained release: 500 mg

Generic AvailableYes
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsCalcium Pantothenate; Vitamin B_5
International Brand NamesCalcium Pantothenicum (PL); Kerato Biciron (DE); Pantothen Streuli (CH)

Papain-Containing Topical Products: FDA Enforcement Action - November 2008

In September 2008, the U.S. Food and Drug Administration (FDA) ordered companies to discontinue manufacturing papain-containing topical products by November 24, 2008, and to cease shipping of these products by January 21, 2009. At present, all topical products containing papain (~35 products under various trade names) lack FDA approval. Safety concerns have also been raised from reports of serious hypersensitivity reactions, including anaphylaxis, associated with papain use. Hypotension and tachycardia has also been observed in association with these hypersensitivity reactions. In addition, the medical literature also suggests that patients with latex hypersensitivity may also be allergic to papaya, the source of papain.

Papain-containing topical products manufactured prior to the ordered stop date may still be found on pharmacy shelves for a short period of time. However, healthcare providers are reminded that alternative products with FDA approval for the management of wounds are available.

Additional information may be found at http://www.fda.gov/cder/news/papain/qa.htm

Pronunciation(pa PAY in & yoor EE a)

U.S. Brand NamesAccuzyme®; Accuzyme® SE; AllanEnzyme; Ethezyme™ 650 [DSC]; Ethezyme™ 830 [DSC]; Ethezyme™ [DSC]; Kovia®; Paptase™

Pharmacologic CategoryEnzyme, Topical Debridement

Use: Labeled IndicationsDebridement of necrotic tissue and liquefaction of slough in acute and chronic lesions such as pressure ulcers, varicose and diabetic ulcers, burns, postoperative wounds, pilonidal cyst wounds, carbuncles, and miscellaneous traumatic or infected wounds

Dosing: AdultsTopical: Apply with each dressing change. Daily or twice daily dressing changes are preferred, but may be every 2-3 days. Cover with dressing following application.

Ointment: Apply $^1/_8$-inch thickness over the wound with clean applicator.

Spray: Completely cover the wound site so that the wound is not visible.

Dosing: ElderlyRefer to adult dosing.

Administration: Topical**Note:** If eschar is present it may be necessary to consult qualified practitioner to cross-hatch the eschar prior to application. The wound should be completely covered by application.

Ointment, spray: Cleanse wound prior to application. May apply under pressure dressings. Initially may require more frequent dressing changes to decrease irritation from enzymatic activity. Avoid cleansing with hydrogen peroxide solution. Avoid using heavy metal-containing solutions (eg, lead, mercury, silver). Do not use in or around the eyes.

Spray: Cleanse wound prior to application. Shake well before use; tap bottom of bottle on solid surface several times to loosen liquid from inside walls. Prime pump (initial use only): Hold spray upright directly above the wound and prime the pump 10-14 times. Normal use: Allow a distance of 1-2 inches between the spray container and the wound; may hold spray at an angle or upright.

Storage

Ointment: Store in a cool place; do not refrigerate.

Spray: Store upright in a cool place at 8°C to 15°C (46°F to 59°F); do not refrigerate.

ContraindicationsHypersensitivity to papain, urea, or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: Anaphylaxis and severe hypersensitivity reactions have occurred with papain use. Tachycardia and hypotension, in association with some hypersensitivity reactions, have also been observed.

- Latex hypersensitivity: Inconclusive data suggests a possible cross-sensitivity may exist between patients with natural rubber latex hypersensitivity and papaya, the source of papain.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Administration: For external use only; not for use in the eyes.

Geriatric ConsiderationsPreventive skin care should be instituted in all older patients at high risk for pressure ulcers.
Adverse ReactionsFrequency not defined: Local: Burning sensation, skin irritation

Postmarketing and/or case reports: Anaphylaxis, hypersensitivity reactions

Drug InteractionsThere are no known significant interactions.
Nursing: Physical Assessment/MonitoringSee individual agent for Urea.
Patient EducationSee individual agent for Urea.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Aerosol, topical:

Paptase™: Papain 8.3 x 10^5 units/g and urea 10% (45 g)

Emulsion, topical [spray]:

AllanEnzyme: Papain 8.3 x 10^5 units/g and urea 10% (33 mL)

Generic AvailableYes: Ointment
Pricing: U.S. (www.drugstore.com)

Emulsion (Accuzyme SE)

830000-10 units/g-% (34): $49.99

Ointment (Accuzyme)

830000-100unit-mg/gm (30): $54.55

Mechanism of Action

Papain: Potent digestant of nonviable protein matter; harmless to viable tissue. Requires activation to exert its function.

Urea: Exposes papain activators (sulfhydryl groups) and denatures nonviable protein matter making it more susceptible to enzymatic digestion.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported

Papaverine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(pa PAV er een)

U.S. Brand NamesPara-Time SR®

Pharmacologic CategoryVasodilator

Use: Labeled IndicationsOral: Relief of peripheral and cerebral ischemia associated with arterial spasm and myocardial ischemia complicated by arrhythmias

Use: Unlabeled/InvestigationalInvestigational: Parenteral: Various vascular spasms associated with muscle spasms as in myocardial infarction, angina, peripheral and pulmonary embolism, peripheral vascular disease, angiospastic states, and visceral spasm (ureteral, biliary, and GI colic); testing for impotence

Dosing: Adults**Arterial spasm:**

Oral, sustained release: 150-300 mg every 12 hours; in difficult cases: 150 mg every 8 hours

I.M., I.V.: 30-65 mg (rarely up to 120 mg); may repeat every 3 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Arterial spasm:** I.M., I.V.: 6 mg/kg/day in 4 divided doses

Administration: I.V.Rapid I.V. administration may result in arrhythmias and fatal apnea; administer no faster than over 1-2 minutes.

Administration: I.V. DetailpH: Not <3; 3-4 (2% solution in water)

Dietary ConsiderationsMay be taken with food.

StorageStore at 15°C to 30°C (59°F to 86°F). Protect from light.

ReconstitutionSolutions should be clear to pale yellow. Precipitates with lactated Ringer's.

CompatibilityStable in dextran 6% in dextrose, dextran 6% in NS, D_5LR, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5NS, D_5W, $D_{10}W$, ${}^1/_2NS$, NS; **incompatible** with LR.

Compatibility in syringe: Compatible: Iohexol 64.7%, iopamidol 61%, iothalamate sodium 60%, metrizamide 48.25%, phentolamine. **Incompatible:** Diatrizoate meglumine 52%, diatrizoate sodium 8%. **Variable (consult detailed reference):** Diatrizoate meglumine 66%, diatrizoate sodium 10%, diatrizoate sodium 60%, ioxaglate meglumine 39.3%, ioxaglate sodium 19.6%.

Compatibility when admixed: Compatible: Theophylline. **Incompatible:** Aminophylline with trimecaine.

ContraindicationsHypersensitivity to papaverine or any component of the formulation

Allergy Considerations

- Benzylisoquinoline Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Arrhythmias: May (in large doses or with rapid infusion) depress AV and intraventricular cardiac conduction leading to serious arrhythmias (eg, premature beats, paroxysmal tachycardia).

- Hepatitis: May cause hepatic hypersensitivity (eosinophilia with abnormal LFTs.

Disease-related concerns:

- Glaucoma: Use with caution in patients with glaucoma.

Other warnings/precautions:

- I.V. administration: Administer I.V. cautiously since apnea and arrhythmias may result.

Geriatric ConsiderationsVasodilators have been used to treat dementia upon the premise that dementia is secondary to a cerebral blood flow insufficiency. The hypothesis is that if blood flow could be increased, cognitive function would be increased. This hypothesis is no longer valid. The use of vasodilators for cognitive dysfunction is not recommended or proven by appropriate scientific study.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmias (with rapid I.V. use), flushing of the face, mild hypertension, tachycardia

Central nervous system: Drowsiness, headache, lethargy, sedation, vertigo

Gastrointestinal: Abdominal distress, anorexia, constipation, diarrhea, nausea

Hepatic: Chronic hepatitis, hepatic hypersensitivity

Respiratory: Apnea (with rapid I.V. use)

Drug Interactions

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Nursing: Physical Assessment/MonitoringUse caution in presence of glaucoma. **I.V., I.M.:** Blood pressure and heart rate should be monitored. **I.V.:** Should be administered slowly (over 1-2 minutes) to avoid apnea or arrhythmias. **Oral:** Blood pressure and heart rate should be monitored prior to therapy and at frequent intervals thereafter. Assess therapeutic effectiveness and adverse response (eg, arrhythmias, tachycardia, hypertension, GI disturbance). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed; do not alter dose or discontinue without consulting prescriber. Swallow extended release capsules whole; do not chew, crush, or dissolve. May cause dizziness, confusion, or blurred vision (avoid driving or engaging in tasks that require alertness until response to drug is known); or constipation (increased exercise, fluids, fruit, or fiber may help). Report rapid heartbeat or palpitations and CNS changes (eg, depression, persistent sedation or lethargy, or acute headache). **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, sustained release, as hydrochloride: 150 mg

Para-Time SR®: 150 mg

Injection, solution, as hydrochloride: 30 mg/mL (2 mL, 10 mL)

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsule, controlled release (Papaverine HCl CR)

150 mg (60): $19.98

Solution (Papaverine HCl)

30 mg/mL (10): $25.99

Mechanism of ActionSmooth muscle spasmolytic producing a generalized smooth muscle relaxation including: vasodilatation, gastrointestinal sphincter relaxation, bronchiolar muscle relaxation, and potentially a depressed myocardium (with large doses); muscle relaxation may occur due to inhibition or cyclic nucleotide phosphodiesterase, increasing cyclic AMP; muscle relaxation is unrelated to nerve innervation; papaverine increases cerebral blood flow in normal subjects; oxygen uptake is unaltered

Pharmacodynamics/Kinetics

Onset of action: Oral: Rapid

Protein binding: 90%

Metabolism: Rapidly hepatic

Half-life elimination: 0.5-1.5 hours

Excretion: Primarily urine (as metabolites)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness or dizziness

Mental Health: Effects on Psychiatric TreatmentMay decrease the effects of levodopa

Anesthesia and Critical Care Concerns/Other ConsiderationsThe use of vasodilators for cognitive dysfunction is **not** recommended.

Index TermsPapaverine Hydrochloride; Pavabid [DSC]

Pronunciation

(pap ih LO ma VYE rus typs six e LEV en SIX teen AYE teen vak SEEN YU man ree KOM be nant)

U.S. Brand NamesGardasil®

Canadian Brand NamesGardasil®

Pharmacologic CategoryVaccine, Inactivated (Viral)

Use: Labeled IndicationsFemales: Prevention of cervical, vulvar, and vaginal cancer, genital warts, cervical adenocarcinoma *in situ*, and vulvar, vaginal, or cervical intraepithelial neoplasia caused by human papillomavirus (HPV) types 6, 11, 16, 18

The Advisory Committee on Immunization Practices (ACIP) recommends routine vaccination for females 11-12 years of age; catch-up vaccination is recommended for females 13-26 years of age

Dosing: Adults**Immunization regimen:** I.M.: Females: Children ≥9 years and Adults ≤26 years: 0.5 mL followed by 0.5 mL at 2 and 6 months after initial dose

CDC recommended immunization schedule: Administer first dose to females at age 11-12 years; begin series in females aged 13-26 years if not previously vaccinated. Minimum interval between first and second doses is 4 weeks; the minimum interval between first and third doses is 24 weeks.

Dosing: Pediatric**Immunization regimen:** Females: Children ≥9 years: Refer to adult dosing.

Administration: I.M.Shake suspension well before use. Inject I.M. into the deltoid region of the upper arm or higher anterolateral thigh area. Observe for syncope for 15 minutes following administration.

Administration with other vaccines:

Papillomavirus (Types 6, 11, 16, 18) Recombinant vaccine with other inactivated vaccines: May be given simultaneously or at any interval between doses.

Papillomavirus (Types 6, 11, 16, 18) Recombinant vaccine with live vaccines: May be given simultaneously or at any interval between doses

Vaccine administration with antibody-containing products: Papillomavirus (Types 6, 11, 16, 18) Recombinant vaccine may be given simultaneously at different sites or at any interval between doses. Examples of antibody-containing products include I.M. and I.V. immune globulin, hepatitis B immune globulin, tetanus immune globulin, varicella zoster immune globulin, rabies immune globulin, whole blood, packed red cells, plasma, and platelet products

For patients at risk of hemorrhage following intramuscular injection, the ACIP recommends "it should be administered intramuscularly if, in the opinion of the physician familiar with the patients bleeding risk, the vaccine can be administered with reasonable safety by this route. If the patient receives antihemophilia or other similar therapy, intramuscular vaccination can be scheduled shortly after such therapy is administered. A fine needle (23 gauge or smaller) can be used for the vaccination and firm pressure applied to the site (without rubbing) for at least 2 minutes. The patient should be instructed concerning the risk of hematoma from the injection."

StorageStore at 2°C to 8°C (36°F to 46°F); do not freeze. Protect from light.

ContraindicationsHypersensitivity to papillomavirus recombinant vaccine or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use.
- Syncope: Syncope may occur following vaccination; observe for 15 minutes following administration.

Disease-related concerns:

- Acute illness: May consider deferring administration in patients with moderate or severe acute illness (with or without fever); may administer to patients with mild acute illness (with or without fever).
- Bleeding disorders: Use with caution in patients with a history of bleeding disorders (including thrombocytopenia) and/or patients on anticoagulant therapy; bleeding/hematoma may occur from I.M. administration.
- Human papillomavirus (HPV) infection: There is no evidence that individuals already infected with HPV will be protected; those already infected with 1 or more HPV types were protected from disease in the remaining HPV types. Not for the treatment of active disease; will not protect against diseases not caused by HPV vaccine types 6, 11, 16, and 18.

Concurrent drug therapy issues:

- Vaccines: In order to maximize vaccination rates, the ACIP recommends simultaneous administration of all age-appropriate vaccines (live or inactivated) for which a person is eligible at a single clinic visit, unless contraindications exist.

Special populations:

- Altered immunocompetence: Use with caution in severely immunocompromised patients (eg, patients receiving chemo/radiation therapy or other immunosuppressive therapy (including high dose corticosteroids)); may have a reduced response to vaccination.

- Males: Safety and efficacy have not been established in males.

- Pediatrics: Safety and efficacy have not been established in girls <9 years of age.

- Pregnancy: Not recommended for use during pregnancy.

- Women: Safety and efficacy have not been established in women >26 years of age.

Dosage form specific issues:

- Yeast: Product may contain yeast.

Other warnings/precautions:

- Maximum efficacy: The entire 3-dose regimen should be completed for maximum efficacy.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. Administration of the vaccine in pregnancy is not recommended. In clinical trials, women who were found to be pregnant before the completion of the 3-dose regimen were instructed to defer any remaining dose until pregnancy resolution. Pregnancies detected within 30 days of vaccination had a higher rate of congenital anomalies (pyloric stenosis, congenital megacolon, congenital hydronephrosis, hip dysplasia, club foot) than the placebo group. Pregnancies with onset beyond 30 days of vaccination had a rate of congenital anomalies consistent with the general population. Overall, the type of teratogenic events were the same as those generally observed for this age group. A registry has been established for women exposed to the HPV vaccine during pregnancy (1-800-986-8999).

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsInfants had a higher incidence of acute respiratory illness when breast-fed by mothers within 30 days postvaccination. Lactating women may receive vaccine.

Adverse Reactions**All serious adverse reactions must be reported to the U.S. Department of Health and Human Services (DHHS) Vaccine Adverse Event Reporting System (VAERS) 1-800-822-7967.**

>10%:

Central nervous system: Fever (13%)

Local: Injection site: Pain (84%), swelling (25%), erythema (25%)

1% to 10%:

Central nervous system: Dizziness (4%), malaise (1%), insomnia (1%)

Gastrointestinal: Nausea (7%), diarrhea (4%), vomiting (2%), toothache (2%)

Local: Injection site: Bruising (3%), pruritus (3%)

Neuromuscular & skeletal: Arthralgia (1%)

Respiratory: Cough (2%), nasal congestion (1%)

<1%, postmarketing, and/or case reports: Anaphylactic/anaphylactoid reaction, appendicitis, arrhythmia, arthritis, asthma, autoimmune hemolytic anemia, bronchospasm, DVT, fatigue, gastroenteritis, Guillain-Barré syndrome, headache, hypersensitivity reaction, hyperthyroidism, JRA, lymphadenopathy, motor neuron disease, myalgia, pancreatitis, paralysis, pelvic inflammatory disease, pulmonary embolus, RA, renal failure (acute), seizure, sepsis, syncope, transverse myelitis, urticaria, weakness

Drug Interactions

Immunosuppressants: May diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Monitoring ParametersGynecologic screening exam, papillomavirus test; observe for syncope/fainting for ~15 minutes after administration of vaccine

Nursing: Physical Assessment/MonitoringNot for treatment of active disease. Assess for impaired immune responsiveness; may have reduced antibody response to immunizations. Treatment for anaphylactic/anaphylactoid reaction should be available during vaccine use; if there is a hypersensitivity response after receiving a dose of Gardasil®, patient should not receive further doses. **Note:** All serious adverse reactions must be reported to the U.S. DHHS. Federal law requires that date of administration, name of manufacturer, lot number, administering person's name, title, and address be recorded in patient's permanent medical record. All patients should be informed that the vaccine is not a treatment for active disease and is not a substitute for regular, routine cervical screening. Teach patient appropriate use (necessity for 3 doses), possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationThis vaccine is not a treatment for active disease and does not substitute for regular, routine cervical cancer screening. Three doses will be required for effective immunity; consult prescriber for appropriate schedule of vaccinations. May cause drowsiness, malaise, or insomnia (do not drive or engage in activities that require alertness and coordination until response to drug is known); diarrhea (buttermilk, boiled milk, or yogurt may help); or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). May cause some redness, pain, or swelling at injection site; consult prescriber if excessive or persistent. Notify prescriber immediately of any acute reaction (eg, difficulty breathing, chest pain, acute headache, rash, difficulty swallowing). **Breast-feeding precaution:** Inform prescriber if you are or intend to breast-feed.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, suspension [preservative free]:

Gardasil®: HPV 6 L1 protein 20 mcg, HPV 11 L1 protein 40 mcg, HPV 16 L1 protein 40 mcg, and HPV 18 L1 protein 20 mcg per 0.5 mL (0.5 mL) [contains aluminum, polysorbate 80; manufactured using *S. cerevisiae* (baker's yeast)]

Generic Available No
Manufacturer Merck & Co, Inc
Pricing: U.S. (www.drugstore.com)

Suspension (Gardasil)

(0.5): $149.73

(3): $842.04

(5): $1351.67

Mechanism of Action Contains inactive human papillomavirus (HPV) proteins HPV 6 L1, HPV 11 L1, HPV 16 L1, and HPV 18 L1 which produce neutralizing antibodies to prevent cervical cancer, cervical adenocarcinoma, cervical, vaginal and vulvar neoplasia and genital warts caused by HPV.
Related Information

- Immunization Recommendations

Pharmacotherapy Pearls Federal law requires that the date of administration, the vaccine manufacturer, lot number of vaccine, and the administering person's name, title and address be entered into the patient's permanent medical record. Ideally, administration of vaccine should occur prior to potential HPV exposure. Benefits of vaccine decrease once infected with ≥1 of the HPV vaccine types.
Dental Health: Effects on Dental Treatment No significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions
Index Terms HPV Vaccine ; Human Papillomavirus Vaccine; Papillomavirus Vaccine, Recombinant; Quadrivalent Human Papillomavirus Vaccine

Paregoric

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Camphorated tincture of opium is an error-prone synonym (mistaken as opium tincture)

Paregoric may be confused with Percogesic®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Use care when prescribing opium tincture; each mL contains the equivalent of morphine 10 mg; paregoric contains the equivalent of morphine 0.4 mg/mL

Pronunciation(par e GOR ik)

Pharmacologic CategoryAnalgesic, Opioid

Use: Labeled IndicationsTreatment of diarrhea or relief of pain; neonatal opiate withdrawal

Dosing: Adults**Diarrhea:** Oral: 5-10 mL 1-4 times/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Neonatal opiate withdrawal: Oral: 3-6 drops every 3-6 hours as needed, or initially 0.2 mL every 3 hours; increase dosage by approximately 0.05 mL every 3 hours until withdrawal symptoms are controlled; it is rare to exceed 0.7 mL/dose. Stabilize withdrawal symptoms for 3-5 days, then gradually decrease dosage over a 2- to 4-week period.

Diarrhea: Oral: Children: 0.25-0.5 mL/kg 1-4 times/day

StorageStore in light-resistant, tightly-closed container.

RestrictionsC-III

ContraindicationsHypersensitivity to opium or any component of the formulation; diarrhea caused by poisoning until the toxic material has been removed; pregnancy (prolonged use or high doses)

Allergy Considerations

- Belladonna Alkaloid Allergy
- Benzylisoquinoline Allergy
- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hypotension: May cause hypotension; use with caution in patients with hypovolemia, cardiovascular disease (including acute MI), or drugs which may exaggerate hypotensive effects (including phenothiazines or general anesthetics).
- Opioid agonist toxicities: Opium shares the toxic potentials of opiate agonists, and precautions of opiate agonist therapy should be observed.

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.
- Biliary tract impairment: Use with caution in patients with biliary tract dysfunction; acute pancreatitis may cause constriction of sphincter of Oddi.
- CNS depression/coma: Use with caution in patients with CNS depression or coma.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.

- Hepatic impairment: Use with caution in patients with hepatic dysfunction.

- Obesity: Use with caution in patients who are morbidly obese.

- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.

- Renal impairment: Use with caution in patients with renal dysfunction.

- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages.

- Seizures: Use with caution in patients with a history of seizure disorders.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Dosage form specific issues:

- Sulfites: Some preparations contain sulfites which may cause allergic reactions

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.

- Pediatrics: Infants <3 months of age are more susceptible to respiratory depression; use with caution and generally in reduced doses in this age group.

Other warnings/precautions:

- Withdrawal: Concurrent use of agonist/antagonist analgesics may precipitate withdrawal symptoms and/or reduced analgesic efficacy in patients following prolonged therapy with mu opioid agonists. Abrupt discontinuation following prolonged use may also lead to withdrawal symptoms.

Pregnancy Risk FactorB/D (prolonged use or high doses)
LactationEnters breast milk/use caution
Breast-Feeding ConsiderationsInformation regarding use while breast-feeding is based on experience with morphine. Probably safe with low doses and by administering dose after breast-feeding to further minimize exposure to the drug. Monitor the infant for possible side effects related to opiates.
Adverse ReactionsFrequency not defined.

Cardiovascular: Hypotension, peripheral vasodilation

Central nervous system: Drowsiness, dizziness, insomnia, CNS depression, mental depression, increased intracranial pressure, restlessness, headache, malaise

Gastrointestinal: Constipation, anorexia, stomach cramps, nausea, vomiting, biliary tract spasm

Genitourinary: Ureteral spasms, decreased urination, urinary tract spasm

Hepatic: Increased liver function tests

Neuromuscular & skeletal: Weakness

Ocular: Miosis

Respiratory: Respiratory depression

Miscellaneous: Physical and psychological dependence, histamine release

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Nursing: Physical Assessment/MonitoringMonitor for excessive sedation, respiratory depression, or hypotension. For inpatients, implement safety measures (eg, side rails up, call light within reach, patient instructions to call for assistance). Has potential for psychological or physiological dependence

Patient EducationTake exactly as directed; do not increase dosage. May cause dependence with prolonged or excessive use. Avoid alcohol or any other prescription and OTC medications that may cause sedation (sleeping medications, some cough/cold remedies, antihistamines, etc). You may experience drowsiness, dizziness, or impaired judgment (use caution when driving or engaging in tasks that require alertness until response to drug is known) or postural hypotension (use caution when rising from sitting or lying position or when climbing stairs). You may experience nausea or loss of appetite (small frequent meals may help) or constipation (a laxative may be necessary). Report unresolved nausea, vomiting, respiratory difficulty (shortness of breath or decreased respirations), chest pain, or palpitations. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. If breast-feeding, take immediately after feeding or 4-6 hour before next feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Liquid, oral: Morphine equivalent 2 mg/5 mL (473 mL) [equivalent to opium 20 mg powder; contains alcohol 45% and benzoic acid]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tincture (Paregoric)

2 mg/5 mL (240): $69.98

Mechanism of ActionIncreases smooth muscle tone in GI tract, decreases motility and peristalsis, diminishes digestive secretions

Pharmacodynamics/KineticsIn terms of opium:

Metabolism: Hepatic

Excretion: Urine (primarily as morphine glucuronide conjugates and unchanged drug - morphine, codeine, papaverine, etc)

Pharmacotherapy PearlsContains morphine 0.4 mg/mL and alcohol 45%. Do **not** confuse this product with opium tincture which is 25 times **more** potent; each 5 mL of paregoric contains 2 mg morphine equivalent, 0.02 mL anise oil, 20 mg benzoic acid, 20 mg camphor, 0.2 mL glycerin and alcohol; final alcohol content 45%; paregoric also contains papaverine and noscapine; because all of these additives may be harmful to neonates, **a 25-fold dilution of opium tincture** is often preferred for treatment of neonatal abstinence syndrome (opiate withdrawal).

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness and dizziness are common; may cause restlessness; may rarely cause insomnia or depression

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive sedation

Index TermsCamphorated Tincture of Opium (error-prone synonym)

Paricalcitol

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

Pronunciation(pah ri KAL si tole)

U.S. Brand NamesZemplar®

Canadian Brand NamesZemplar®

Pharmacologic CategoryVitamin D Analog

Use: Labeled Indications

I.V.: Prevention and treatment of secondary hyperparathyroidism associated with stage 5 chronic kidney disease (CKD)

Oral: Prevention and treatment of secondary hyperparathyroidism associated with stage 3 and 4 CKD

Dosing: Adults**Note:** If hypercalcemia or Ca x P >75 is observed, reduce or interrupt dosing until parameters are normalized.

Secondary hyperparathyroidism associated with chronic renal failure (stage 5 CKD): Children ≥5 years and Adults: I.V.: 0.04-0.1 mcg/kg (2.8-7 mcg) given as a bolus dose no more frequently than every other day at any time during dialysis; dose may be increased by 2-4 mcg every 2-4 weeks; doses as high as 0.24 mcg/kg (16.8 mcg) have been administered safely; the dose of paricalcitol should be adjusted based on serum intact PTH (iPTH) levels, as follows:

Same or increasing iPTH level: Increase paricalcitol dose

iPTH level decreased by <30%: Increase paricalcitol dose

iPTH level decreased by >30% and <60%: Maintain paricalcitol dose

iPTH level decrease by >60%: Decrease paricalcitol dose

iPTH level 1.5-3 times upper limit of normal: Maintain paricalcitol dose

Secondary hyperparathyroidism associated with stage 3 and 4 CKD: Adults: Oral: Initial dose based on baseline serum iPTH:

iPTH ≤500 pg/mL: 1 mcg/day or 2 mcg 3 times/week

iPTH >500 pg/mL: 2 mcg/day or 4 mcg 3 times/week

Dosage adjustment based on iPTH level relative to baseline, adjust dose at 2-4 week intervals:

iPTH same or increased: Increase paricalcitol dose by 1 mcg/day or 2 mcg 3 times/week

iPTH decreased by <30%: Increase paricalcitol dose by 1 mcg/day or 2 mcg 3 times//week

iPTH decreased by ≥30% or ≤60%: Maintain paricalcitol dose

iPTH decreased by >60%: Decrease paricalcitol dose by 1 mcg/day* or 2 mcg 3 times/week

iPTH <60 pg/mL: Decrease paricalcitol dose by 1 mcg/day* or 2 mcg 3 times/week

*If patient is taking the lowest dose on a once-daily regimen, but further dose reduction is needed, decrease dose to 1 mcg 3 times/week. If further dose reduction is required, withhold drug as needed and restart at a lower dose. If applicable, calcium-phosphate binder dosing may also be adjusted or withheld, or switch to noncalcium-based binder.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Secondary hyperparathyroidism associated with chronic renal failure (stage 5 CKD):** I.V.: Children ≥5 years: Refer to adult dosing.

Dosing: Renal ImpairmentRefer to adult dosing.

Dosing: Hepatic ImpairmentAdjustment not needed for mild-to-moderate impairment. Paricalcitol has not been evaluated in severe hepatic impairment.

Administration: I.V.Administered as a bolus dose at anytime during dialysis. Doses should not be administered more often than every other day.

Administration: OralMay be administered with or without food. With the 3 times/week dosing schedule, doses should not be given more frequently than every other day.

Dietary Considerations

The capsules may contain coconut or palm kernel oil.

ContraindicationsHypersensitivity to paricalcitol or any component of the formulation; patients with evidence of vitamin D toxicity; hypercalcemia

Warnings/Precautions

Concerns related to adverse effects:

- Excessive vitamin D: Excessive vitamin D administration may lead to over suppression of PTH, progressive or acute hypercalcemia, hypercalciuria, hyperphosphatemia and adynamic bone disease.

- Hypercalcemia: Progressive and/or acute hypercalcemia may increase risk of cardiac arrhythmias and seizures; chronic hypercalcemia may lead to generalized vascular and other soft-tissue calcification. Phosphate and vitamin D (and its derivatives) should be withheld during therapy to avoid hypercalcemia.

Concurrent drug therapy issues:

- Cardiac glycosides: Use with caution in patients taking cardiac glycosides; digitalis toxicity is potentiated by hypocalcemia.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children for the oral formulation or in children <5 years of age for the I.V. formulation.

Geriatric ConsiderationsNo specific dose changes necessary. Monitor closely. It may be advised to obtain baseline electrolytes, calcium, phosphorous, and digoxin serum concentrations, if applicable.
Pregnancy Risk FactorC
Pregnancy Considerations

Teratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women.

LactationExcretion in breast milk unknown/not recommended
Adverse Reactions

>10%: Gastrointestinal: Nausea (6% to 13%)

1% to 10%:

Cardiovascular: Edema (7%), hypertension (7%), hypotension (5%), palpitation (3%), chest pain (3%), syncope (3%), cardiomyopathy (2%), MI (2%), postural hypotension (2%)

Central nervous system: Pain (8%), chills (5%), dizziness (5%), headache (5%), lightheadedness (5%), vertigo (5%), fever (3% to 5%), depression (3%), insomnia (2%)

Dermatologic: Rash (2% to 6%), skin ulcer (3%), pruritus (3%), skin hypertrophy (2%)

Endocrine & metabolic: Dehydration (3%), acidosis (2%), hypokalemia (2%)

Gastrointestinal: Vomiting (6% to 8%), diarrhea (7%), GI bleeding (5%), abdominal pain (4%), xerostomia (3%), constipation (4%), gastroenteritis (3%), dyspepsia (2%), gastritis (2%), rectal disorder (2%)

Genitourinary: Urinary tract infection (3%), kidney function abnormal (2%)

Neuromuscular & skeletal: Arthritis (5%), back pain (4%), leg cramps (3%), weakness (3%), neuropathy (2%)

Ocular: Amblyopia (2%), retinal disorder (2%)

Respiratory: Pneumonia (2% to 5%), rhinitis (5%), sinusitis (3%), bronchitis (3%), cough (3%), epistaxis (2%)

Miscellaneous: Infection (bacterial, fungal, viral: 2% to 8%); allergic reaction (6%), flu-like syndrome (2% to 5%), sepsis (5%), cyst (2%)

Postmarketing and/or case reports: Facial edema, oral edema, taste perversion (metallic), urticaria

Metabolism/Transport Effects

Substrate of CYP3A4 (major)

Drug InteractionsThere are no known significant interactions.
Monitoring Parameters

Signs and symptoms of vitamin D intoxication

Serum calcium and phosphorus:

I.V.: Twice weekly during initial phase, then at least monthly once dose established

Oral: At least every 2 weeks for 3 months or following dose adjustment, then monthly for 3 months, then every 3 months

Serum or plasma intact PTH (iPTH):

I.V.: Every 3 months

Oral: At least every 2 weeks for 3 months or following dose adjustment, then monthly for 3 months, then every 3 months

In trials, a mean PTH level reduction of 30% was achieved within 6 weeks with I.V. administration

Reference Range

CKD (definition of stages; chronic disease is kidney damage or GFR <60 mL/minute/1.73 m^2 for ≥3 months)

- Stage 3: GFR 30-59 mL/minute/1.73 m^2 (moderate decrease GFR)
- Stage 4: GFR 15-29 mL/minute/1.73 m^2 (severe decreased GFR)
- Stage 5: GFR <15 mL/minute/1.73 m^2 or dialysis (kidney failure)

Target range for iPTH:

- Stage 3 CKD: 35-70 pg/mL
- Stage 4 CKD: 70-110 pg/mL
- Stage 5 CKD: 150-300 pg/mL

Serum phosphorous:

- Stage 3 and 4 CKD: ≥2.7 to <4.6 mg/dL
- Stage 5 CKD: 3.5-5.5 mg/dL

Nursing: Physical Assessment/MonitoringAssess results of laboratory tests. Monitor patient response and adverse effects. Monitor for signs and symptoms of vitamin D intoxication and hypercalcemia. Assess knowledge/instruct patient on safe and appropriate use of paricalcitol and dietary requirements.

Monitoring: Lab TestsSerum calcium and phosphorus should be monitored closely (eg, twice weekly) during dose titration. Monitor serum PTH. In trials, a mean PTH level reduction of 30% was achieved within 6 weeks.

Patient EducationTake as directed; do not increase dosage without consulting prescriber. Adhere to diet as recommended (do not take any other phosphate or vitamin D related compounds while taking paricalcitol). You may experience nausea or vomiting (small frequent meals, frequent mouth care, chewing gums, or sucking lozenges may help); swelling of extremities (elevate feet when sitting); or lightheadedness or dizziness (use caution when driving or engaging in tasks requiring alertness until response to drug is known). Report persistent fever, gastric disturbances, abdominal pain or blood in stool, chest pain or palpitations, bone pain, irritability, muscular twitching, weakness, or signs of respiratory infection or flu. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, gelatin: 1 mcg, 2 mcg, 4 mcg [contains alcohol and coconut or palm kernel oil]

Injection, solution: 2 mcg/mL (1 mL); 5 mcg/mL (1 mL, 2 mL) [contains alcohol 20% v/v and propylene glycol 30% v/v]

Generic AvailableNo

ManufacturerAbbott Laboratories (Pharmaceutical Product Division)

Pricing: U.S. (www.drugstore.com)

Capsules (Zemplar)

- 1 mcg (30): $226.67
- 4 mcg (30): $915.98

Mechanism of ActionDecreased renal conversion of vitamin D to its primary active metabolite (1,25-hydroxyvitamin D) in chronic renal failure leads to reduced activation of vitamin D receptor (VDR), which subsequently removes inhibitory suppression of parathyroid hormone (PTH) release; increased serum PTH (secondary hyperparathyroidism) reduces calcium excretion and enhances bone resorption. Paricalcitol is a synthetic vitamin D analog which binds to and activates the VDR in kidney, parathyroid gland, intestine and bone, thus reducing PTH levels and improving calcium and phosphate homeostasis.

Pharmacodynamics/Kinetics

Distribution: V_d:

- Healthy subjects: Oral: 34 L; I.V.: 24 L
- Stage 3 and 4 CKD: Oral: 44-46 L
- Stage 5 CKD: I.V.: 31-35 L

Protein binding: >99%

Metabolism: Hydroxylation and glucuronidation via hepatic and nonhepatic enzymes, including CYP24, CYP3A4, UGT1A4; forms metabolites (at least one active)

Bioavailability: Oral: ~72% in healthy subjects

Half-life elimination:

- Healthy subjects: Oral: 4-6 hours
- Stage 3 and 4 CKD: Oral: 17-20 hours
- Stage 5 CKD: I.V.: 14-15 hours

Excretion: Healthy subjects: Feces (oral: 70% to 74%; I.V.: 63%); urine (oral: 16% to 18%, I.V.: 19%); 51% to 59% as metabolites

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentNone reported

Pronunciation(par oh moe MYE sin)

U.S. Brand NamesHumatin® [DSC]

Canadian Brand NamesHumatin®

Pharmacologic Category[Amebicide]

Use: Labeled IndicationsTreatment of acute and chronic intestinal amebiasis; hepatic coma

Use: Unlabeled/InvestigationalTreatment of cryptosporidiosis

Dosing: Adults

Intestinal amebiasis: Oral: 25-35 mg/kg/day in 3 divided doses for 5-10 days

Infection by*Dientamoeba fragilis*: Oral: 25-30 mg/kg/day in 3 divided doses for 7 days

Infection by*Cryptosporidium*(unlabeled use): Oral: Adults with AIDS: 1.5-2.25 g/day in 3-6 divided doses for 10-14 days (occasionally courses of up to 4-8 weeks may be needed)

Tapeworm (fish, dog, bovine, porcine): Oral: 1 g every 15 minutes for 4 doses

Hepatic coma: Oral: 4 g/day in 2-4 divided doses for 5-6 days

Dwarf tapeworm: Oral: 45 mg/kg/dose every day for 5-7 days

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Intestinal amebiasis: Children: Refer to adult dosing.

Infection by*Dientamoeba fragilis*: Children: Refer to adult dosing.

Tapeworm (fish, dog, bovine, porcine): Oral: Children: 11 mg/kg every 15 minutes for 4 doses

Dwarf tapeworm: Children: Refer to adult dosing.

ContraindicationsHypersensitivity to paromomycin or any component of the formulation; intestinal obstruction

Warnings/Precautions

Concerns related to adverse effects:

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment.
- Ulcerative bowel lesions: Use with caution in patients with possible or proven ulcerative bowel lesions.

Pregnancy Risk FactorC

LactationDoes not enter breast milk/compatible

Breast-Feeding ConsiderationsParomomycin is not expected to be excreted in breast milk since the drug is not systemically available after oral ingestion.

Adverse Reactions

1% to 10%: Gastrointestinal: Diarrhea, abdominal cramps, nausea, vomiting, heartburn

<1%: Headache, vertigo, exanthema, rash, pruritus, steatorrhea, secondary enterocolitis, eosinophilia, ototoxicity

Drug InteractionsThere are no known significant interactions.

Ethanol/Nutrition/Herb InteractionsFood: Paromomycin may cause malabsorption of xylose, sucrose, and fats.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule: 250 mg

Humatin®: 250 mg [DSC]

Generic AvailableYes

Mechanism of ActionActs directly on ameba; has antibacterial activity against normal and pathogenic organisms in the GI tract; interferes with bacterial protein synthesis by binding to 30S ribosomal subunits

Pharmacodynamics/Kinetics

Absorption: None

Excretion: Feces (100% as unchanged drug)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsParomomycin Sulfate

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

PARoxetine may be confused with FLUoxetine, paclitaxel, pyridoxine

Paxil® may be confused with Doxil®, paclitaxel, Plavix®, Taxol®

Pronunciation(pa ROKS e teen)

U.S. Brand NamesPaxil CR®; Paxil®; Pexeva®

Canadian Brand NamesApo-Paroxetine®; CO Paroxetine; Gen-Paroxetine; Novo-Paroxetine; Paxil CR®; Paxil®; PMS-Paroxetine; ratio-Paroxetine; Rhoxal-paroxetine; Sandoz-Paroxetine

Pharmacologic CategoryAntidepressant, Selective Serotonin Reuptake Inhibitor

Use: Labeled IndicationsTreatment of major depressive disorder (MDD); treatment of panic disorder with or without agoraphobia; obsessive-compulsive disorder (OCD); social anxiety disorder (social phobia); generalized anxiety disorder (GAD); post-traumatic stress disorder (PTSD); premenstrual dysphoric disorder (PMDD)

Use: Unlabeled/InvestigationalMay be useful in eating disorders, impulse control disorders, self-injurious behavior; vasomotor symptoms of menopause; treatment of depression and obsessive-compulsive disorder (OCD) in children; treatment of mild dementia-associated agitation in nonpsychotic patients

Dosing: Adults

Major depressive disorder: Oral:

Paxil®, Pexeva®: Initial: 20 mg once daily, preferably in the morning; increase if needed by 10 mg/day increments at intervals of at least 1 week; maximum dose: 50 mg/day

Paxil CR®: Initial: 25 mg once daily; increase if needed by 12.5 mg/day increments at intervals of at least 1 week; maximum dose: 62.5 mg/day

Generalized anxiety disorder (Paxil®, Pexeva®): Oral: Initial: 20 mg once daily, preferably in the morning (if dose is increased, adjust in increments of 10 mg/day at 1-week intervals); doses of 20-50 mg/day were used in clinical trials, however, no greater benefit was seen with doses >20 mg.

Obsessive-compulsive disorder (Paxil®, Pexeva®): Oral: Initial: 20 mg once daily, preferably in the morning; increase if needed by 10 mg/day increments at intervals of at least 1 week; recommended dose: 40 mg/day; range: 20-60 mg/day; maximum dose: 60 mg/day

Panic disorder: Oral:

Paxil®, Pexeva®: Initial: 10 mg once daily, preferably in the morning; increase if needed by 10 mg/day increments at intervals of at least 1 week; recommended dose: 40 mg/day; range: 10-60 mg/day; maximum dose: 60 mg/day

Paxil CR®: Initial: 12.5 mg once daily; increase if needed by 12.5 mg/day at intervals of at least 1 week; maximum dose: 75 mg/day

Premenstrual dysphoric disorder (Paxil CR®): Oral: Initial: 12.5 mg once daily in the morning; may be increased to 25 mg/day; dosing changes should occur at intervals of at least 1 week. May be given daily throughout the menstrual cycle or limited to the luteal phase.

Post-traumatic stress disorder (Paxil®): Oral: Initial: 20 mg once daily, preferably in the morning; increase if needed by 10 mg/day increments at intervals of at least 1 week; range: 20-50 mg. Limited data suggest doses of 40 mg/day were not more efficacious than 20 mg/day.

Social anxiety disorder: Oral:

Paxil®: Initial: 20 mg once daily, preferably in the morning; recommended dose: 20 mg/day; range: 20-60 mg/day; doses >20 mg may not have additional benefit

Paxil CR®: Initial: 12.5 mg once daily, preferably in the morning; may be increased by 12.5 mg/day at intervals of at least 1 week; maximum dose: 37.5 mg/day

Menopause-associated vasomotor symptoms (unlabeled use, Paxil CR®): Oral: 12.5-25 mg/day

Note: Upon discontinuation of paroxetine therapy, gradually taper dose:

Paxil®, Pexeva®: 10 mg/day at weekly intervals; when 20 mg/day dose is reached, continue for 1 week before treatment is discontinued. Some patients may need to be titrated to 10 mg/day for 1 week before discontinuation.

Paxil CR®: Patients receiving 37.5 mg/day in clinical trials had their dose decreased by 12.5 mg/day to a dose of 25 mg/day and remained at a dose of 25 mg/day for 1 week before treatment was discontinued.

Dosing: Elderly

Major depressive disorder, obsessive compulsive disorder, panic attack, social anxiety disorder:

Paxil®, Pexeva®: Oral: Initial: 10 mg/day; increase if needed by 10 mg/day increments at intervals of at least 1 week; maximum dose: 40 mg/day

Paxil CR®: Initial: 12.5 mg/day; increase if needed by 12.5 mg/day increments at intervals of at least 1 week; maximum dose: 50 mg/day

Note: Upon discontinuation of paroxetine therapy, gradually taper dose:

Paxil®, Pexeva®: 10 mg/day at weekly intervals; when 20 mg/day dose is reached, continue for 1 week before treatment is discontinued. Some patients may need to be titrated to 10 mg/day for 1 week before discontinuation.

Paxil CR®: Patients receiving 37.5 mg/day in clinical trials had their dose decreased by 12.5 mg/day to a dose of 25 mg/day and remained at a dose of 25 mg/day for 1 week before treatment was discontinued.

Dosing: Pediatric

Depression (unlabeled use; not recommended by FDA): Oral: Initial: 10 mg/day and adjusted upward on an individual basis to 20 mg/day

Obsessive-compulsive disorder (unlabeled use): Oral: Initial: 10 mg/day and titrate up as necessary to 60 mg/day

Self-injurious behavior (unlabeled use): Oral: 20 mg/day

Social anxiety disorder (unlabeled use): Oral: 2.5-15 mg/day

Dosing: Renal Impairment

Cl_{cr} <30 mL/minute: Mean plasma concentrations ~4 times that seen in normal function.

Cl_{cr} 30-60 mL/minute: Plasma concentrations 2 times that seen in normal function.

Paxil®, Pexeva®: Adults: Initial: 10 mg/day; increase if needed by 10 mg/day increments at intervals of at least 1 week; maximum dose: 40 mg/day

Paxil CR®: Initial: 12.5 mg/day; increase if needed by 12.5 mg/day increments at intervals of at least 1 week; maximum dose: 50 mg/day

Dosing: Hepatic Impairment

In hepatic dysfunction, plasma concentration is 2 times that seen in normal function.

Paxil®, Pexeva®: Initial: 10 mg/day; increase if needed by 10 mg/day increments at intervals of at least 1 week; maximum dose: 40 mg/day

Paxil CR®: Initial: 12.5 mg/day; increase if needed by 12.5 mg/day increments at intervals of at least 1 week; maximum dose: 50 mg/day

Calculations

- Creatinine Clearance: Adults

Administration: Oral

May be administered with or without food. Do not crush, break, or chew controlled release tablets.

Dietary Considerations

May be taken with or without food.

Storage

Suspension: Store at ≤25°C (≤77°F).

Tablet: Store at 15°C to 30°C (59°F to 86°F).

Restrictions

An FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.

Contraindications

Hypersensitivity to paroxetine or any component of the formulation; use with or within 14 days of MAO inhibitors; concurrent use with thioridazine or pimozide

Allergy Considerations

- Selective Serotonin Reuptake Inhibitor (SSRI) Allergy

Warnings/Precautions

Boxed warnings:

- Suicidal thinking/behavior: See “Major psychiatric warnings” below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor patients for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 months of therapy or during periods of dosage adjustments (increases or decreases); the patient’s family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants should be dispensed with each prescription. **Paroxetine is not FDA approved for use in children.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants (for any indication) should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **Paroxetine is not FDA approved for the treatment of bipolar depression.**

Concerns related to adverse effects:

- Akathisia: Inability to remain still due to feelings of agitation or restlessness has been observed with paroxetine and other SSRIs. Usually occurs within the first few weeks of therapy.

- Anticholinergic effects: Has low potential for sedation and anticholinergic effects relative to cyclic antidepressants; however among the SSRI class these effects are relatively higher.

- Bleeding risk: May impair platelet aggregation resulting in increased risk of bleeding events, particularly if used concomitantly with aspirin, NSAIDs, warfarin or other anticoagulants. Bleeding related to SSRI use has been reported to range from relatively minor bruising and epistaxis to life-threatening hemorrhage.

- CNS depression: Has a low potential to impair cognitive or motor performance; caution operating hazardous machinery or driving.

- Sexual dysfunction: May cause or exacerbate sexual dysfunction.

- SIADH and hyponatremia: SSRIs and SNRIs have been associated with the development of SIADH; hyponatremia has been reported rarely (including severe cases with serum sodium <110 mmol/L), predominately in the elderly. Volume depletion and/or concurrent use of diuretics likely increases risk.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease; paroxetine has not been systemically evaluated in patients with a recent history of MI or unstable heart disease.

- Hepatic impairment: Use with caution in patients with hepatic impairment; clearance is decreased and plasma concentrations are increased; a lower dosage may be needed.

- Narrow-angle glaucoma: May cause mydriasis which can exacerbate narrow angle glaucoma.

- Renal impairment: Use with caution in patients with renal impairment; clearance is decreased and plasma concentrations are increased; a lower dosage may be needed.

- Seizure disorder: Use with caution in patients with a previous seizure disorder or condition predisposing to seizures such as brain damage or alcoholism.

Concurrent drug therapy issues:

- Agents which lower seizure threshold: Concurrent therapy of paroxetine with these drugs may increase the risk of seizure.

- Anticoagulants/Antiplatelets: Use caution with concomitant use of NSAIDs, ASA, or other drugs that affect coagulation; the risk of bleeding may be potentiated.

- CNS depressants: Use caution with concomitant therapy.

- MAO inhibitors: Potential for severe reaction when used with MAO inhibitors; autonomic instability, coma, death, delirium, diaphoresis, hyperthermia, mental status changes/agitation, muscular rigidity, myoclonus, neuroleptic malignant syndrome features, and seizures may occur. Concurrent use with paroxetine is contraindicated.

- Serotonin syndrome: Symptoms of agitation, confusion, hallucinations, hyper-reflexia, myoclonus, shivering, and tachycardia may occur with concomitant proserotonergic drugs (eg, SSRIs, SNRIs, triptans) or agents which reduce paroxetine's metabolism. Concurrent use of serotonin precursors (eg, tryptophan) is not recommended.

- Thioridazine and pimozide: Potential for QT_c prolongation and arrhythmia; concurrent use of paroxetine with either of these agents is contraindicated.

Special populations:

- Elderly: Use caution in elderly patients; risk of hyponatremia and other adverse events may be increased.

- Pediatrics: Safety and efficacy in children have not been established.

- Pregnancy: Avoid use in the first trimester.

Other warnings/precautions:

- Electroconvulsive therapy: May increase the risks associated with electroconvulsive therapy; consider discontinuing, when possible, prior to ECT treatment.

- Withdrawal syndrome: May cause dysphoric mood, irritability, agitation, dizziness, sensory disturbances, anxiety, confusion, headache, lethargy, emotional lability, insomnia, hypomania, tinnitus, and seizures. Upon discontinuation of paroxetine therapy, gradually taper dose. If intolerable symptoms occur following a decrease in dosage or upon discontinuation of therapy, then resuming the previous dose with a more gradual taper should be considered.

Geriatric ConsiderationsParoxetine is the most sedating and anticholinergic of the selective serotonin reuptake inhibitors. Paroxetine has been shown to be an equally effective antidepressant compared to nortriptyline in patients with ischemic heart disease. However, nortriptyline was associated with a significantly higher rate of adverse cardiac events (sustained increase in heart rate, sinus tachycardia, and asymptomatic increase in ventricular ectopy) compared to placebo. The elderly are more prone to SSRI/SNRI-induced hyponatremia.

Pregnancy Risk FactorD

Pregnancy ConsiderationsDue to adverse events observed in human studies, paroxetine is classified as pregnancy category D. Paroxetine crosses the placenta. The risk of cardiovascular and other congenital malformations may be higher with paroxetine than with other antidepressants. Nonteratogenic effects in the newborn following SSRI exposure late in the third trimester include respiratory distress, cyanosis, apnea, seizures, temperature instability, feeding difficulty, vomiting, hypoglycemia, hypo- or hypertonia, hyper-reflexia, jitteriness, irritability, constant crying, and tremor. An increased risk of low birth weight, lower APGAR scores, and blunted behavioral response to pain for a prolonged period after delivery has also been reported. Exposure to SSRIs after the twentieth week of gestation has been associated with persistent pulmonary hypertension of the newborn (PPHN). Adverse effects may be due to toxic effects of the SSRI or drug withdrawal due to discontinuation. The long-term effects of *in utero* SSRI exposure on infant development and behavior are not known.

Due to pregnancy-induced physiologic changes, women who are pregnant may require increased doses of paroxetine to achieve euthymia. Women treated for major depression and who are euthymic prior to pregnancy are more likely to experience a relapse when medication is discontinued as compared to pregnant women who continue taking antidepressant medications. The ACOG recommends that therapy with SSRIs or SNRIs during pregnancy be individualized; treatment of depression during pregnancy should incorporate the clinical expertise of the mental health clinician, obstetrician, primary healthcare provider, and pediatrician (ACOG, 2007). The ACOG also recommend that therapy with paroxetine be avoided during pregnancy if possible and that fetuses exposed in early pregnancy be assessed with a fetal echocardiography. If treatment during pregnancy is required, consider tapering therapy during the third trimester in order to prevent withdrawal symptoms in the infant. If this is done and the woman is considered to be at risk from her major depressive disorder, the medication can be restarted following delivery, although the dose should be readjusted to that required before pregnancy.

LactationEnters breast milk/use caution (AAP rates “of concern”)

Breast-Feeding ConsiderationsParoxetine is excreted in breast milk and concentrations in the hindmilk are higher than in foremilk. Paroxetine has not been detected in the serum of nursing infants and adverse events have not been reported. The AAP considers paroxetine to be a "drug for which the effect on the nursing infant is unknown but may be of concern." The manufacturer recommends that caution be exercised when administering paroxetine to nursing women.

The long-term effects on development and behavior have not been studied; therefore, one should prescribe paroxetine to a mother who is breast-feeding only when the benefits outweigh the potential risks.

Adverse ReactionsFrequency varies by dose and indication. Adverse reactions reported as a composite of all indications.

>10%:

Central nervous system: Somnolence (15% to 24%), insomnia (11% to 24%), headache (17% to 18%), dizziness (6% to 14%)

Endocrine & metabolic: Libido decreased (3% to 15%)

Gastrointestinal: Nausea (19% to 26%), xerostomia (9% to 18%), constipation (5% to 16%), diarrhea (9% to 12%)

Genitourinary: Ejaculatory disturbances (10% to 28%)

Neuromuscular & skeletal: Weakness (12% to 22%), tremor (4% to 11%)

Miscellaneous: Diaphoresis (5% to 14%)

1% to 10%:

Cardiovascular: Vasodilation (2% to 4%), chest pain (3%), palpitation (2% to 3%), hypertension (≥1%), tachycardia (≥1%)

Central nervous system: Nervousness (4% to 9%), anxiety (5%), agitation (3% to 5%), abnormal dreams (3% to 4%), concentration impaired (3% to 4%), yawning (2% to 4%), depersonalization (up to 3%), amnesia (2%), emotional lability (≥1%), vertigo (≥1%), confusion (1%), chills (2%)

Dermatologic: Rash (2% to 3%), pruritus (≥1%)

Endocrine & metabolic: Orgasmic disturbance (2% to 9%), dysmenorrhea (5%)

Gastrointestinal: Anorexia, appetite decreased (5% to 9%), dyspepsia (2% to 5%), flatulence (4%), abdominal pain (4%), appetite increased (2% to 4%), vomiting (2% to 3%), taste perversion (2%), weight gain (≥1%)

Genitourinary: Impotence (2% to 9%), genital disorder (female 2% to 9%), urinary frequency (2% to 3%), urinary tract infection (2%)

Otic: Tinnitus (≥1%)

Respiratory: Respiratory disorder (up to 7%), pharyngitis (4%), sinusitis (up to 4%), rhinitis (3%)

Miscellaneous: Infection (5% to 6%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Acute renal failure, adrenergic syndrome, akinesia, alkaline phosphatase increased, allergic reaction, anaphylaxis, anemias (various), angina pectoris, angioedema, aphasia, aphthous stomatitis, arrhythmias (atrial and ventricular), arthrosis, asthma, behavioral disturbances (various), bilirubinemia, bleeding time increased, blood dyscrasias, bloody diarrhea, bradycardia, bronchitis, bulimia, BUN increased, bundle branch block, cardiospasm, cataract, cellulitis, cerebral ischemia, cerebrovascular accident, cholelithiasis, colitis, congestive heart failure, creatinine phosphokinase increased, deafness, dehydration, delirium, diabetes mellitus, drug dependence, dyskinesia, dysphagia, dyspnea, dystonia, ecchymosis, eclampsia, electrolyte abnormalities, emphysema, erythema, exfoliative dermatitis, extrapyramidal syndrome, fecal impactions, fungal dermatitis, gamma globulins increased, gastroenteritis, glaucoma, goiter, Guillain-Barré syndrome, hallucinations, hematemesis, hematoma, hemorrhage, hemoptysis, hepatic necrosis, hepatitis, hypercholesteremia, hyper-/hypoglycemia, hyper-/hypothyroidism, hypotension, ileus, intestinal obstruction, jaundice, ketosis, lactic dehydrogenase increased, liver function tests abnormal, low cardiac output, lung fibrosis, lymphadenopathy, meningitis, MI, migraine, myelitis, myocardial ischemia, neuroleptic malignant syndrome, neuropathy, osteoporosis, pancreatitis, pancytopenia, peptic ulcer, peritonitis, phlebitis, pneumonia, platelet count abnormalities, pulmonary edema, pulmonary embolus, pulmonary hypertension, seizure, sepsis, serotonin syndrome, status epilepticus, suicidal tendencies, syncope, tetany, thrombophlebitis, thrombosis, tongue edema, torsade de pointes, toxic epidermal necrolysis, vasculitic syndrome

Metabolism/Transport Effects **Substrate** of CYP2D6 (major); **Inhibits** CYP1A2 (weak), 2B6 (moderate), 2C9 (weak), 2C19 (weak), 2D6 (strong), 3A4 (weak)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alpha-/Beta-Blockers: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Alpha-/Beta-Blockers. *Risk C: Monitor therapy*

Amprenavir: May decrease the serum concentration of PARoxetine. *Risk C: Monitor therapy*

Analgesics (Opioid): May enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Anticoagulants: Antiplatelet Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antidepressants (Serotonin Reuptake Inhibitor/Antagonist): Selective Serotonin Reuptake Inhibitors may enhance the serotonergic effect of Antidepressants (Serotonin Reuptake Inhibitor/Antagonist). This may cause serotonin syndrome. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of other Antiplatelet Agents. *Risk C: Monitor therapy*

Aspirin: Selective Serotonin Reuptake Inhibitors may enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Atomoxetine: PARoxetine may decrease the metabolism of Atomoxetine. *Risk D: Consider therapy modification*

Beta-Blockers: Selective Serotonin Reuptake Inhibitors may enhance the bradycardic effect of Beta-Blockers. **Exceptions:** Acebutolol; Atenolol; Carteolol; Esmolol; Levobunolol; Metipranolol; Nadolol; Penbutolol. *Risk C: Monitor therapy*

BusPIRone: May enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. Selective Serotonin Reuptake Inhibitors may decrease the metabolism of BusPIRone. *Risk C: Monitor therapy*

CarBAMazepine: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of CarBAMazepine. Specifically those SSRIs that inhibit CYP3A4 isoenzymes. CarBAMazepine may increase the metabolism of Selective Serotonin Reuptake Inhibitors. Specifically those agents metabolized via CYP1A2, 2C, and/or 3A4 isoenzymes. *Risk D: Consider therapy modification*

Cimetidine: May decrease the metabolism of Selective Serotonin Reuptake Inhibitors. *Risk D: Consider therapy modification*

Clozapine: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Clozapine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2B6 Substrates: CYP2B6 Inhibitors (Moderate) may decrease the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

CYP2D6 Substrates: CYP2D6 Inhibitors (Strong) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk D: Consider therapy modification*

Cyproheptadine: May diminish the therapeutic effect of Selective Serotonin Reuptake Inhibitors. *Risk C: Monitor therapy*

Darunavir: May decrease the serum concentration of PARoxetine. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Desmopressin: Selective Serotonin Reuptake Inhibitors may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Dextromethorphan: Selective Serotonin Reuptake Inhibitors may enhance the adverse/toxic effect of Dextromethorphan. *Risk D: Consider therapy modification*

Drotrecogin Alfa: Antiplatelet Agents may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

DULoxetine: PARoxetine may decrease the metabolism of DULoxetine. *Risk C: Monitor therapy*

Fesoterodine: CYP2D6 Inhibitors may increase serum concentrations of the active metabolite(s) of Fesoterodine. *Risk C: Monitor therapy*

Fosamprenavir: May decrease the serum concentration of PARoxetine. The active metabolite amprenavir is likely responsible for this effect. *Risk C: Monitor therapy*

Galantamine: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Galantamine. *Risk C: Monitor therapy*

Haloperidol: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Haloperidol. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Antiplatelet Agents. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Iobenguane I 123: Selective Serotonin Reuptake Inhibitors may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Lithium: Selective Serotonin Reuptake Inhibitors may enhance the adverse/toxic effect of Lithium. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk X: Avoid combination*

Methadone: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Methadone. Fluvoxamine appears to be the only interacting SSRI. *Risk D: Consider therapy modification*

Mexiletine: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Mexiletine. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): Selective Serotonin Reuptake Inhibitors may enhance the antiplatelet effect of NSAID (COX-2 Inhibitor). *Risk D: Consider therapy modification*

NSAID (Nonselective): Selective Serotonin Reuptake Inhibitors may enhance the antiplatelet effect of NSAID (Nonselective). *Risk D: Consider therapy modification*

Omega-3-Acid Ethyl Esters: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

Pimozide: Selective Serotonin Reuptake Inhibitors may enhance the adverse/toxic effect of Pimozide. *Risk X: Avoid combination*

Propafenone: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Propafenone. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Risperidone: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Risperidone. *Risk C: Monitor therapy*

Salicylates: Antiplatelet Agents may enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Tamoxifen: CYP2D6 Inhibitors (Strong) may decrease the metabolism of Tamoxifen. Specifically, strong CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk X: Avoid combination*

Tetrabenazine: CYP2D6 Inhibitors (Strong) may increase the serum concentration of Tetrabenazine. Specifically, concentrations of the active alpha- and beta-dihydrotetrabenazine metabolites may be increased. Management: Tetrabenazine dose should be reduced by 50% when starting a strong CYP2D6 inhibitor. Maximum tetrabenazine dose is 50mg/day when used with a strong CYP2D6 inhibitor. *Risk D: Consider therapy modification*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

Thrombolytic Agents: Antiplatelet Agents may enhance the anticoagulant effect of Thrombolytic Agents. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

TraMADol: Selective Serotonin Reuptake Inhibitors may enhance the neuroexcitatory and/or seizure-potentiating effect of TraMADol. TraMADol may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: Selective Serotonin Reuptake Inhibitors may decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Tryptophan: May enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Selective Serotonin Reuptake Inhibitors may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Peak concentration is increased, but bioavailability is not significantly altered by food.

Herb/Nutraceutical: Avoid valerian, St John's wort, SAMe, kava kava.

Monitoring ParametersMental status for depression, suicidal ideation (especially at the beginning of therapy or when doses are increased or decreased), anxiety, social functioning, mania, panic attacks; akathisia

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescription or OTC medications or herbal products patient may be taking. Assess results of laboratory tests. Assess therapeutic effectiveness (according to rationale for prescribing), and adverse reactions at beginning of therapy and frequently with long-term use. Monitor for clinical worsening and suicidal ideation. Taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report

Monitoring: Lab TestsHepatic and renal function

Patient EducationTake exactly as directed; do not increase dose or frequency or discontinue without consulting prescriber. It may take 2-3 weeks to achieve desired results. Take in the morning to reduce the incidence of insomnia (may be taken with or without food). Do not crush, break, or chew controlled release (Paxil CR®) tablets. Avoid alcohol, caffeine, and other prescription or OTC medications not approved by prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, dizziness, or lightheadedness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, anorexia, or dry mouth (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or orthostatic hypotension (use caution when climbing stairs or changing position from lying or sitting to standing). Report persistent insomnia or excessive daytime sedation; muscle cramping, tremors, weakness, or change in gait; chest pain, palpitations, or rapid heartbeat; vision changes or eye pain; respiratory difficulty or breathlessness; abdominal pain or blood in stool; change in affect or thought processes, unusual agitation, or abnormal dreams; worsening of condition; or suicidal ideation. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Note: Strength expressed as base:

Suspension, oral, as hydrochloride: 10 mg/5 mL (250 mL)

  Paxil®: 10 mg/5 mL (250 mL) [orange flavor]

Tablet, as hydrochloride: 10 mg, 20 mg, 30 mg, 40 mg

  Paxil®: 10 mg, 20 mg, 30 mg, 40 mg

Tablet, as mesylate:

  Pexeva®: 10 mg, 20 mg, 30 mg, 40 mg

Tablet, controlled release, as hydrochloride: 37.5 mg

  Paxil CR®: 12.5 mg, 25 mg, 37.5 mg

Tablet, extended release, as hydrochloride: 12.5 mg, 25 mg

Generic AvailableYes

ManufacturerSmithKline Beecham Pharmaceuticals

Pricing: U.S. (www.drugstore.com)

Suspension (Paxil)

  10 mg/5 mL (250): $166.90

Tablet, 24-hour (Paroxetine HCl)

  12.5 mg (30): $96.99

  25 mg (30): $99.99

  37.5 mg (30): $101.99

Tablet, 24-hour (Paxil CR)

20 mg (30): $103.98

30 mg (30): $113.99

40 mg (30): $115.99

Tablets (Pexeva)

20 mg (30): $155.01

30 mg (30): $163.49

40 mg (30): $166.94

Mechanism of ActionParoxetine is a selective serotonin reuptake inhibitor, chemically unrelated to tricyclic, tetracyclic, or other antidepressants; presumably, the inhibition of serotonin reuptake from brain synapse stimulated serotonin activity in the brain

Pharmacodynamics/Kinetics

Onset of action: Depression: The onset of action is within a week; however, individual response varies greatly and full response may not be seen until 8-12 weeks after initiation of treatment.

Absorption: Completely absorbed following oral administration

Distribution: V_d: 8.7 L/kg (3-28 L/kg)

Protein binding: 93% to 95%

Metabolism: Extensively hepatic via CYP2D6 enzymes; primary metabolites are formed via oxidation and methylation of parent drug, with subsequent glucuronide/sulfate conjugation; nonlinear pharmacokinetics (via 2D6 saturation) may be seen with higher doses and longer duration of therapy. Metabolites exhibit ~2% potency of parent compound. C_{min} concentrations are 70% to 80% greater in the elderly compared to nonelderly patients; clearance is also decreased.

Half-life elimination: 21 hours (3-65 hours)

Time to peak: Immediate release: 5.2 hours; controlled release: 6-10 hours

Excretion: Urine (64%, 2% as unchanged drug); feces (36% primarily via bile, <1% as unchanged drug)

Pharmacotherapy PearlsPaxil CR® incorporates a degradable polymeric matrix (Geomatrix™) to control dissolution rate over a period of 4-5 hours. An enteric coating delays the start of drug release until tablets have left the stomach.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation), postural hypotension, and abnormal taste. Problems with SSRI-induced bruxism have been reported and may preclude their use; clinicians attempting to evaluate any patient with bruxism or involuntary muscle movement, who is simultaneously being treated with an SSRI drug, should be aware of the potential association. Prolonged use may decrease or inhibit salivary flow; normal salivation resumes upon discontinuation.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsAlthough caution should be used in patients taking tricyclic antidepressants, no interactions have been reported with vasoconstrictor and paroxetine, a nontricyclic antidepressant which acts to increase serotonin; no precautions appear to be needed

Mental Health: Child/Adolescent Considerations

Depression: Paroxetine was shown to be effective and generally well tolerated in a recent randomized, double-blind, placebo-controlled parallel-design study; 275 adolescents (12-18 years of age) with major depression were randomized to receive paroxetine, imipramine, or placebo; 93 patients (mean age: 14.8 ± 1.6 years) received paroxetine at initial doses of 20 mg/day given in the morning; doses were increased if needed at week 5 to 30 mg/day (given in divided doses) and at weeks 6-8 to 40 mg/day (given in divided doses); 48% of patients remained at the initial starting dose of 20 mg/day; mean optimal daily dose: 28 ± 8.54 mg (Keller, 2001). Paroxetine was shown to be effective and well tolerated in an open label clinical trial in 45 children <14 years of age (mean: 10.7 ± 2 years) with major depression (Rey-Sanchoz, 1997). Doses were initiated at 10 mg/day and adjusted upward on an individual basis with a mean dose of 16.2 mg/day used for an average of 8.4 months. Further studies are needed.

Obsessive-compulsive disorder (OCD): Twenty OCD outpatients 8-17 years of age were treated with daily doses ranging from 10-60 mg/day for 12 weeks (Rosenberg, 1999). A randomized, double-blind, placebo-controlled trial with paroxetine was conducted in 207 pediatric patients (aged 7-17 years) meeting DSM-IV criteria for OCD (Geller et al, 2004). Patients received 10-50 mg/day paroxetine or placebo for 10 weeks and change from baseline of the Children's Yale-Brown Obsessive-Compulsive Scale was assessed as the primary endpoint. In the intent-to-treat population, paroxetine was associated with a significant adjusted mean difference improvement (-3.45; 95% CI: -5.6 to -1.29, p =0.002) compared to placebo. Side effects were generally mild to moderate, with 10% and 3% of paroxetine- and placebo-receiving patients, respectively, discontinuing due to adverse events.

Self-injurious behavior: A 15-year old autistic male with self-injurious behavior was successfully treated with 20 mg/day (Snead, 1994). Further studies are needed.

Social anxiety disorder: A small case series reported the effective use of paroxetine in 5 pediatric patients with social phobia [2 children (7 and 11 years of age) and 3 adolescents (16, 17, and 18 years of age)]; comorbid diagnoses (obsessive compulsive disorder and/or dysthymia) existed in 3 patients; doses were adjusted on an individual basis; the 7-year old was started on 2.5 mg/day and increased to 5 mg/day after 4 weeks; the 11-year old was started on 5 mg/day and the dose was titrated upwards by 5 mg/day increments every 3-4 weeks to 15 mg/day; adolescents were started on 20 mg/day (Mancini, 1999); further studies are needed. In a 16-week trial of pediatric patients (aged 8-17 years) presenting with social anxiety disorder, 163 were randomized to receive paroxetine (10-50 mg/day) and 156 to receive placebo (Wagner et al, 2004). From the intent-to-treat analysis, 77.6% of paroxetine patients responded (achievement of Clinical Global Impression-Improvement score of 1 or 2) compared to 38.3% of placebo patients (odds ratio: 7.02, $p < 0.001$). Adverse events occurred in 5% of paroxetine-receiving patients (twice the placebo rate) and consisted mainly of insomnia, decreased appetite and vomiting.

A recent report described the SSRI discontinuation syndrome in 6 children; the syndrome was similar to that reported in adults (Diler, 2002).

Mental Health CommentThe SSRIs as a class are generally considered to be safe and equally effective. For the management of depression, these drugs display a flat dose-response curve. Allow sufficient dose-response time (6-12 weeks). Differences lie in approved indications, receptor profiles, pharmacokinetics, and cytochrome P450 activity profile. Subtle differences exist in adverse effect profiles. All SSRIs have the potential to cause sexual dysfunction. Among the SSRIs, paroxetine is felt to be the most sedating and anticholinergic. Discontinuation syndromes may be more severe with paroxetine compared to other SSRIs. It also has been associated with more long-term weight gain (Marks, 2008).

Pharmacologic Category[Chemotherapy Regimen, Lung Cancer (Nonsmall Cell)]

Regimen UseLung cancer, nonsmall cell

RegimenNOTE: Multiple variations are listed below.

Variation 1:

Paclitaxel: I.V.: 175-225 mg/m^2 day 1

[total dose/cycle = 175-225 mg/m^2]

Carboplatin: I.V.: Target AUC 5-7 day 1

[total dose/cycle = AUC = 5-7]

Repeat cycle every 21 days for 2-8 cycles

Variation 2:

Paclitaxel: I.V.: 175 mg/m^2 day 1

[total dose/cycle = 175 mg/m^2]

Cisplatin: I.V.: 80 mg/m^2 day 1

[total dose/cycle = 80 mg/m^2]

Repeat cycle every 21 days

Variation 3:

Paclitaxel: I.V.: 135 mg/m^2 continuous infusion day 1

[total dose/cycle = 135 mg/m^2]

Carboplatin: I.V.: AUC 7.5 day 2

[total dose/cycle = AUC = 7.5]

Repeat cycle every 21 days

Variation 4:

Paclitaxel: I.V.: 135 mg/m^2 continuous infusion day 1

[total dose/cycle = 135 mg/m^2]

Cisplatin: I.V.: 75 mg/m^2 day 2

[total dose/cycle = 75 mg/m^2]

Repeat cycle every 21 days

Pharmacologic Category[Chemotherapy Regimen, Leukemia, Chronic Lymphocytic]

Regimen UseLeukemia, chronic lymphocytic

Index TermsPentostatin-Cyclophosphamide-Rituximab

RegimenNOTE: Multiple variations are listed below.

Variation 1:

Cycle 1:

Cyclophosphamide: I.V.: 600 mg/m^2 day 1

[total dose/cycle = 600 mg/m^2]

Pentostatin: I.V.: 4 mg/m^2 day 1

[total dose/cycle = 4 mg/m^2]

Treatment cycle is 3 weeks

Cycles 2-6:

Cyclophosphamide: I.V.: 600 mg/m^2 day 1

[total dose/cycle = 600 mg/m^2]

Pentostatin: I.V.: 4 mg/m^2 day 1

[total dose/cycle = 4 mg/m^2]

Rituximab: I.V.: 375 mg/m^2 day 1

[total dose/cycle = 375 mg/m^2]

Repeat cycle every 3 weeks

Variation 2:

Cycle 1:

Pentostatin: I.V.: 2 mg/m^2 day 1

[total dose/cycle = 2 mg/m^2]

Cyclophosphamide: I.V.: 600 mg/m^2 day 1

[total dose/cycle = 600 mg/m^2]

Rituximab: I.V.: 100 mg/m^2 day 1 only

followed by I.V.: 375 mg/m^2/day days 3 and 5 only

[total dose/cycle 1 = 850 mg/m^2]

Treatment cycle is 3 weeks

Cycles 2-6:

Pentostatin: I.V.: 2 mg/m^2 day 1

[total dose/cycle = 2 mg/m^2]

Cyclophosphamide: I.V.: 600 mg/m^2 day 1

[total dose/cycle = 600 mg/m^2]

Rituximab: I.V.: 375 mg/m^2 day 1

[total dose/cycle = 375 mg/m^2]

Repeat cycle every 3 weeks

Pegademase Bovine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(peg A de mase BOE vine)

U.S. Brand NamesAdagen®

Canadian Brand NamesAdagen®

Pharmacologic CategoryEnzyme

Use: Labeled IndicationsEnzyme replacement therapy for adenosine deaminase (ADA) deficiency in patients with severe combined immunodeficiency disease (SCID) who are not candidates for or who have failed bone marrow transplant

Dosing: Pediatric**Note:** Dose should be individualized based on monitoring of plasma ADA activity levels and dATP content.

Adenosine deaminase deficiency (enzyme replacement therapy): I.M.: Infants and Children: Dose given every 7 days, 10 units/kg the first dose, 15 units/kg the second dose, and 20 units/kg the third dose; maintenance dose: 20 units/kg/week is recommended depending on patient's ADA level; maximum single dose: 30 units/kg

Administration: I.M.Administer intramuscularly; do not dilute or mix with other medications prior to administration.

StorageRefrigerate at 2°C to 8°C (36°F to 46°F); do not freeze. Discard unused portions; do not save for further use. Do not use if previously frozen.

ContraindicationsNot to be used as preparatory or support therapy for bone marrow transplantation; severe thrombocytopenia

Warnings/Precautions

Concerns related to adverse effects:

- Antibody formation: Development of antibodies has been reported in patients resulting in more rapid clearance of pegademase bovine. In patients who experience a persistent decrease in preinjection levels of plasma ADA to <10 micromole/hour/mL and have had other causes ruled out (eg, improper storage of vials, improper handling of plasma sample), antibody formation should be considered and a specific assay for antibody ADA should be performed. Dosage adjustments may be required in patients developing antibodies.

Disease-related concerns:

- Immune status: Failure to maintain adequate levels of plasma ADA activity will increase patients risk for infection.

- Thrombocytopenia: Use with caution in patients with thrombocytopenia; should not be used in patients with severe thrombocytopenia.

Other warnings/precautions:

- Appropriate use: Not a substitute for bone marrow transplant; should be used in conjunction with continued close monitoring and appropriate diagnostic tests and therapy. Therapy is not a cure for SCID and must be continued.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies have not been conducted. There are no adequate and well-controlled studies in pregnant women. The benefits versus risks should be considered carefully before initiating pegademase bovine therapy in pregnant women.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

<1%: Headache, pain at injection site

Postmarketing and/or case reports: Autoimmune hemolytic anemia, erythema (injection site), hemolytic anemia, thrombocythemia, urticaria

Drug Interactions

Pentostatin: Pegademase Bovine may diminish the therapeutic effect of Pentostatin. Pentostatin may diminish the therapeutic effect of Pegademase Bovine. *Risk X: Avoid combination*

Monitoring Parameters

Plasma ADA activity prior to treatment, then a preinjection level every 1-2 weeks for the first 8-12 weeks, then twice a month for the next 3-9 months, then monthly until after 18-24 months. After 24 months monitor level every 2-4 months. If therapy is interrupted, more frequent monitoring is required.

Monitor red cell dATP prior to treatment and until levels have decreased adequately (usually after 2 months of maintenance therapy), then monitor 2-4 times a year for first year and 2-3 times a year thereafter. If therapy is interrupted, more frequent monitoring is required.

Monitor immune function and clinical status.

Reference Range

Plasma ADA activity: Recommended maintenance trough level: 15-35 micromole/hour/mL

Red cell dATP: After 2 months of maintenance therapy, levels should decrease to ≤0.005-0.015 micromole/mL (normal dATP value: <0.001

micromole/mL) or ≤1% of total erythrocyte adenine nucleotide (ATP + dATP) content with a normal ATP level

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Adagen®: 250 units/mL (1.5 mL)

Generic AvailableNo

Mechanism of ActionAdenosine deaminase is an enzyme that catalyzes the deamination of both adenosine and deoxyadenosine. Hereditary lack of adenosine deaminase activity results in severe combined immunodeficiency disease, a fatal disorder of infancy characterized by profound defects of both cellular and humoral immunity. It is estimated that 25% of patients with the autosomal recessive form of severe combined immunodeficiency lack adenosine deaminase. Pegademase bovine is a (modified) enzyme replacement for adenosine deaminase deficiency.

Pharmacodynamics/Kinetics

Absorption: Rapid

Half-life elimination: Plasma ADA half-life (following administration): Range: 3 to >6 days

Time to peak: Plasma adenosine deaminase activity: 2-3 days

Pharmacotherapy Pearls

Any indication (laboratory or clinical) of a decrease in potency of Adagen® should be reported to Enzon Pharmaceuticals (866-792-5172).

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

International Brand NamesAdagen (CA)

Pegaptanib

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(peg AP ta nib)

U.S. Brand NamesMacugen®

Canadian Brand NamesMacugen®

Pharmacologic CategoryOphthalmic Agent; Vascular Endothelial Growth Factor (VEGF) Inhibitor

Use: Labeled IndicationsTreatment of neovascular (wet) age-related macular degeneration (AMD)

Dosing: Adults**AMD:** Intravitreous injection: 0.3 mg into affected eye every 6 weeks

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentAdjustment not required with renal impairment; information not available for patients requiring hemodialysis.

Administration: OtherFor intravitreous injection only. Adequate anesthesia and a broad spectrum antibiotic should be administered prior to injection. pH: 6-7

StorageStore under refrigeration at 2°C to 8°C (36°F to 46°F); do not freeze. Do not shake vigorously.

ContraindicationsHypersensitivity to pegaptanib or any component of the formulation; ocular or periocular infection

Warnings/Precautions

Concerns related to adverse effects:

- Endophthalmitis: Intravitreous injections may be associated with endophthalmitis; patients should be instructed to report any signs of infection immediately.
- Hypersensitivity reactions: Rare hypersensitivity reactions (including anaphylaxis) have been associated with use, occurring within several hours of use; monitor closely. Equipment and appropriate personnel should be available for monitoring and treatment of anaphylaxis.
- Increased intraocular pressure: Following injection, intraocular pressure may increased.

Disease-related concerns:

- Hepatic impairment: Safety and efficacy have not been established with hepatic impairment.
- Renal impairment: Safety and efficacy have not been established in patients requiring hemodialysis.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Concurrent administration in both eyes: Safety and efficacy for administration into both eyes concurrently have not been studied.

Geriatric ConsiderationsIn studies, 94% of patients treated with pegaptanib were ≥65 years of age. No difference in efficacy was seen as compared to younger adults.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not reported in animal studies. There are no adequate and well-controlled studies in pregnant women.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

10% to 40%:

Cardiovascular: Hypertension

Ocular: Anterior chamber inflammation, blurred vision, cataract, conjunctival hemorrhage, corneal edema, eye discharge, eye irritation, eye pain, intraocular pressure increased, ocular discomfort, punctate keratitis, visual acuity decreased, visual disturbance, vitreous floaters, vitreous opacities

1% to 10%:

Cardiovascular: Carotid artery occlusion (1% to 5%), cerebrovascular accident (1% to 5%), chest pain (1% to 5%), transient ischemic attack (1% to 5%)

Central nervous system: Dizziness (6% to 10%), headache (6% to 10%), vertigo (1% to 5%)

Dermatologic: Contact dermatitis (1% to 5%)

Endocrine & metabolic: Diabetes mellitus (1% to 5%)

Gastrointestinal: Diarrhea (6% to 10%), nausea (6% to 10%), dyspepsia (1% to 5%), vomiting (1% to 5%)

Genitourinary: Urinary retention (1% to 5%)

Neuromuscular & skeletal: Arthritis (1% to 5%), bone spur (1% to 5%)

Ocular: Blepharitis (6% to 10%), conjunctivitis (6% to 10%), photopsia (6% to 10%), vitreous disorder (6% to 10%), allergic conjunctivitis (1% to 5%), conjunctival edema (1% to 5%), corneal abrasion (1% to 5%), corneal deposits (1% to 5%), corneal epithelium disorder (1% to 5%), endophthalmitis (1% to 5%), eye inflammation (1% to 5%), eye swelling (1% to 5%), eyelid irritation (1% to 5%), meibomianitis (1% to 5%), mydriasis (1% to 5%), periorbital hematoma (1% to 5%), retinal edema (1% to 5%), vitreous hemorrhage (1% to 5%)

Otic: Hearing loss (1% to 5%)

Renal: Urinary tract infection (6% to 10%)

Respiratory: Bronchitis (6% to 10%), pleural effusion (1% to 5%)

Miscellaneous: Contusion (1% to 5%)

<1%: Iatrogenic traumatic cataract, endophthalmitis, retinal detachment

Postmarketing and/or case reports: Anaphylaxis, anaphylactoid reaction, angioedema, hypersensitivity

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersIntraocular pressure (within 30 minutes and 2-7 days after injection); endophthalmitis

Nursing: Physical Assessment/MonitoringAssess allergy history before beginning therapy. Assess visual acuity and intraocular pressure prior to beginning treatment and periodically during treatment. Adequate anesthesia and broad spectrum antibiotic should be administered prior to intravitreous injection. Rare hypersensitivity reactions, including anaphylaxis, can occur within several hours of use; patient should be monitored closely following injection and appropriate emergency equipment should be immediately available. Teach patient/caregiver possible side effects/appropriate interventions and adverse symptoms to report (eg, any signs of infection, intraocular discomfort, or visual disturbances).

Patient EducationThis treatment will not reverse vision loss, but may decrease further loss. Do not rub eyes or use any ocular products unless recommended by prescriber. You may experience dizziness or headache (use caution when driving or engaged in tasks that require alertness until response to drug is known); nausea or vomiting (small frequent meals, frequent mouth care, or sucking lozenges may help); diarrhea (buttermilk, boiled milk, or yogurt may help). Notify prescriber immediately at any sign of infection (redness, drainage, eye pain, itching sensitivity to light, swelling, or change in vision); unusual chest pain or loss of consciousness; acute headache or persistent dizziness; or other persistent adverse effects.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]: 0.3 mg/90 µL (90 µL) [prefilled syringe]

Generic AvailableNo

ManufacturerEyetech Pharmaceuticals; Pfizer Inc

Mechanism of ActionPegaptanib is an apatamer, an oligonucleotide covalently bound to polyethylene glycol, which can adopt a three-dimensional shape and bind to vascular endothelial growth factor (VEGF). Pegaptanib binds to extracellular VEGF, inhibiting VEGF from binding to its receptors and thereby suppressing neovascularization and slowing vision loss.

Pharmacodynamics/Kinetics

Absorption: Slow systemic absorption following intravitreous injection

Metabolism: Metabolized by endo- and exonucleases

Half-life elimination: Plasma: 6-14 days

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentBlurred vision and GI side effects are common. Concomitant use with psychotropics with high anticholinergic load may produce additive effects; monitor. Concomitant use with SSRIs, lithium, or valproic acid may produce additive effects; monitor.

Index TermsEYE001; Pegaptanib Sodium

International Brand NamesMacugen (AT, BE, BG, BR, CH, CZ, DE, DK, FI, FR, GB, GR, HN, IE, IL, IT, NL, NO, PE, PH, PT, RU, SE, SG, TH, TR)

Pegaspargase

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Pegaspargase may be confused with asparaginase

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(peg AS par jase)

U.S. Brand NamesOncaspar®

Pharmacologic CategoryAntineoplastic Agent, Miscellaneous

Use: Labeled IndicationsTreatment of acute lymphocytic leukemia (ALL); treatment of ALL with previous hypersensitivity to native L-asparaginase

Dosing: AdultsUsually administered as part of a combination chemotherapy regimen.

I.M. administration is **preferred** over I.V. administration due to lower incidence of hepatotoxicity, coagulopathy, gastrointestinal and renal disorders with I.M. administration.

Acute lymphoblastic leukemia (ALL): I.M., I.V.: 2500 int. units/m^2 every 14 days

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricUsually administered as part of a combination chemotherapy regimen.

I.M. administration is **preferred** over I.V. administration due to lower incidence of hepatotoxicity, coagulopathy, gastrointestinal and renal disorders with I.M. administration.

Acute lymphoblastic leukemia: I.M., I.V.:

Body surface area <0.6 m^2: 82.5 int. units/kg every 14 days

Body surface area ≥0.6 m^2: 2500 int. units/m^2 every 14 days

Dosing: Combination Regimens

Leukemia (acute lymphocytic): Hyper-CVAD (Leukemia, Acute Lymphocytic)

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: I.M.Must only be administered as a deep intramuscular injection into a large muscle; if I.M. injection volume is >2 mL, use multiple injection sites.

Administration: I.V.May be administered as a 1- to 2-hour I.V. infusion; **do not administer I.V. push**.

Administration: I.V. DetailDo not filter solution. Have available appropriate agents for maintenance of an adequate airway and treatment of a hypersensitivity reaction (antihistamine, epinephrine, oxygen, I.V. corticosteroids). Be prepared to treat anaphylaxis at each administration. Administer through an infusion that is already running.

pH: 7.3

StorageRefrigerate at 2°C to 8°C (36°F to 46°F); do not freeze. Do not use product if it is known to have been frozen. Do not use if stored at room temperature for >48 hours. Avoid excessive agitation; do not shake. Do not use if cloudy or if precipitate is present.

Reconstitution

Standard I.M. dilution: Do not exceed 2 mL volume per injection site.

Standard I.V. dilution: Dilute in 100 mL NS or D_5W; stable for 48 hours at room temperature.

CompatibilityStable in NS, D_5W.

ContraindicationsHypersensitivity to pegaspargase or any component of the formulation; history of serious thrombosis with previous L-asparaginase treatment; pancreatitis or a history of pancreatitis; previous serious allergic reactions (urticaria, bronchospasm, laryngeal edema, hypotension) or other unacceptable adverse reactions to pegaspargase; previous hemorrhagic event with L-asparaginase

Allergy Considerations

- Asparaginase Allergy

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Allergic reactions: Monitor for severe allergic reactions; may be used cautiously in patients who have had hypersensitivity reactions to *E. coli* asparaginase; however, up to 32% of patients who have an allergic reaction to *E. coli* asparaginase will also react to pegaspargase; immediate treatment for hypersensitivity reactions should be available during administration.

- Coagulopathy: Has been reported; monitor coagulation parameters. Use cautiously in patients with an underlying coagulopathy or previous hematologic complications from asparaginase.

- Glucose intolerance: May cause (possibly irreversible) glucose intolerance; use with caution in patients with hyperglycemia.

- Pancreatitis: Discontinue if pancreatitis occurs during treatment.

- Thrombotic events: May occur; discontinue with serious thrombotic event.

Disease-related concerns:

- Diabetes: Use with caution in patients with diabetes mellitus.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

Concurrent drug therapy issues:

- Hepatotoxic medications: Use with caution in patients on concomitant hepatotoxic medications.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted with pegaspargase.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.

Adverse ReactionsIn general, pegaspargase toxicities tend to be less frequent and appear somewhat later than comparable toxicities of asparaginase. Intramuscular rather than intravenous injection may decrease the incidence of coagulopathy; GI, hepatic, and renal toxicity. Except for hypersensitivity reactions, adults tend to have a higher incidence than children.

>5%:

Cardiovascular: Edema

Central nervous system: Fever, malaise

Dermatologic: Rash (1% to >5%)

Gastrointestinal: Nausea, vomiting

Hematologic: Coagulopathy (7%; grades 3/4: 2%)

Hepatic: Transaminases increased (11%; grades 3/4: 3%), ALT increased

Miscellaneous: Allergic reactions (including bronchospasm, chills, dyspnea, edema, erythema, fever, rash, urticaria: 1% to 10%; 32% in patients with prior hypersensitivity to asparaginase products)

1% to 5%:

Cardiovascular: Hypotension, peripheral edema, tachycardia, thrombosis (4%)

Central nervous system: Chills, CNS thrombosis/hemorrhage (2%), headache, seizure

Dermatologic: Lip edema, urticaria

Endocrine & metabolic: Hyperglycemia (3% to 5%), hyperuricemia, hypoglycemia, hypoproteinemia

Gastrointestinal: Abdominal pain, anorexia, diarrhea, pancreatitis (1% to 2%; grades 3/4: 2%)

Hematologic: Anticoagulant effect decreased, disseminated intravascular coagulation (DIC), fibrinogen decreased, hemolytic anemia, leukopenia, pancytopenia, thrombocytopenia, thromboplastin increased, myelosuppression (mild to moderate; onset: 7 days; nadir: 14 days; recovery: 21 days)

Hepatic: Liver function tests abnormal (5%), hyperbilirubinemia, jaundice, AST increased

Local: Injection site hypersensitivity, pain or reaction

Neuromuscular & skeletal: Arthralgia, limb pain, myalgia, paresthesia

Respiratory: Dyspnea

Miscellaneous: Anaphylactic reactions, night sweats

<1%, postmarketing, and/or case reports: Abnormal renal function, alopecia, amylase increased, anemia, antithrombin III decreased, appetite increased, ascites, bone pain, bronchospasm, bruising, BUN increased, chest pain, coagulation disorder, coagulation time increased, colitis, coma, confusion, constipation, cough, creatinine increased, dizziness, DVT, emotional lability, endocarditis, epistaxis, erythema, excessive thirst, face edema, fatigue, fatty liver deposits, flatulence, gastrointestional pain, glucose intolerance, hematuria, hemorrhagic cystitis, hepatomegaly, hyperammonemia, hypertension, hypoalbuminemia, hyponatremia, joint disorder, lesional edema, lipase increased, liver failure, metabolic acidosis, mucositis, petechial rash, polyuria, proteinuria, prothrombin time increased, pruritus, purpura, renal failure, sagittal sinus thrombosis, sepsis, septic shock, somnolence, subacute bacterial endocarditis, superficial venous thrombosis, thirst, upper respiratory infection, uric acid nephropathy, urinary frequency, weight loss

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Monitoring ParametersVital signs during administration, CBC with differential, platelets, amylase, liver enzymes, fibrinogen, PT, PTT, renal function tests, urine dipstick for glucose, blood glucose; monitor for onset of abdominal pain and mental status changes

Nursing: Physical Assessment/MonitoringIdentify patient's allergy history with L-asparaginase before beginning therapy. I.V.: See Administration for infusion specifics and anaphylactic precautions (have a freely-running I.V. in place and emergency medications at hand). Patient must be monitored closely during and for 1 hour following each infusion (anaphylactic reactions can occur with each dose). Assess results of laboratory tests and patient response with each dose (eg, GI disturbance, nausea, vomiting; depression of clotting factors; hypotension). **Note:** I.M. rather than I.V. administration may decrease the incidence of coagulopathy and GI, hepatic, and renal toxicity. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential, platelets, amylase, liver enzymes, fibrinogen, PT, PTT, renal function tests, urine dipstick for glucose, blood glucose

Patient EducationThis drug is given by infusion or injection; report immediately any redness, swelling, burning, or pain at infusion/injection site or any signs of allergic reaction (eg, respiratory difficulty or swallowing, chest tightness, rash, hives, swelling of lips or mouth). Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake and nutrition (small frequent meals will help). You may be more susceptible to infection (avoid crowds and exposure to infection and do not have vaccinations without consulting prescriber). May cause nausea, vomiting, or loss of appetite (frequent mouth care, chewing gum, or sucking lozenges may help); mouth sores (use soft toothbrush, waxed dental floss, and frequent mouth rinses); diarrhea (buttermilk, boiled milk, or yogurt may help); dizziness, drowsiness, syncope, or blurred vision (use caution when driving or engaging in tasks that require alertness until response to drug is known); increased sweating; decreased sexual drive; or cough. Report immediately any unusual bleeding or bruising, nosebleeds, bleeding gums, black tarry stools, blood in urine or stool, pinpoint red spots on your skin; persistent nausea or vomiting; allergic reaction (fever, rash, swelling around mouth, chest pain, rapid heart beat); weakness or fatigue, edema (swelling of extremities or sudden weight gain); or other adverse reactions.
Pregnancy/breast-feeding precautions: Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Oncaspar®: 750 units/mL (5 mL)

Generic AvailableNo

Mechanism of ActionPegaspargase is a modified version of asparaginase. Leukemic cells, especially lymphoblasts, require exogenous asparagine; normal cells can synthesize asparagine. Asparaginase contains L-asparaginase amidohydrolase type EC-2 which inhibits protein synthesis by deaminating asparagine to aspartic acid and ammonia in the plasma and extracellular fluid and therefore deprives tumor cells of the amino acid for protein synthesis. Asparaginase is cycle-specific for the G_1 phase of the cell cycle.

Pharmacodynamics/Kinetics

Duration: Asparaginase was measurable for at least 20 days following initial treatment with pegaspargase

Distribution: V_d: 4-5 L/kg; 70% to 80% of plasma volume; does not penetrate the CSF

Metabolism: Systemically degraded

Half-life elimination: 5.8 days; unaffected by age, renal or hepatic function; half life decreased to 3.2 days in patients with previous hypersensitivity to native L-asparaginase

Excretion: Urine (trace amounts)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common

Mental Health: Effects on Psychiatric TreatmentMay cause pancytopenia; use caution with clozapine and carbamazepine

Index TermsNSC-644954; PEG-L-asparaginase

Medication Safety Issues

Sound-alike/look-alike issues:

Neulasta® may be confused with Neumega® and Lunesta™

Pronunciation(peg fil GRA stim)
U.S. Brand NamesNeulasta®
Canadian Brand NamesNeulasta®
Pharmacologic CategoryColony Stimulating Factor
Use: Labeled IndicationsTo decrease the incidence of infection, by stimulation of granulocyte production, in patients with nonmyeloid malignancies receiving myelosuppressive therapy associated with a significant risk of febrile neutropenia
Dosing: Adults**Myelosuppressive therapy:** SubQ: 6 mg once per chemotherapy cycle; do not administer in the period between 14 days before and 24 hours after administration of cytotoxic chemotherapy
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricAdolescents >45 kg: Refer to adult dosing.
Dosing: Renal ImpairmentNo adjustment necessary.
Administration: OtherDo not use 6 mg fixed dose in infants, children, or adolescents <45 kg. Engage/activate needle guard following use to prevent accidental needlesticks.
StorageStore under refrigeration 2°C to 8°C (36°F to 46°F); do not freeze. If inadvertently frozen, allow to thaw in refrigerator; discard if frozen more than one time. Protect from light. Do not shake. Allow to reach room temperature prior to injection. May be kept at room temperature for up to 48 hours.
ContraindicationsHypersensitivity to pegfilgrastim, filgrastim, *E. coli*-derived proteins, or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Allergic reactions: Anaphylaxis, skin rash, erythema, and urticaria have occurred primarily with the initial dose and may recur after discontinuation; close follow up for several days and permanent discontinuation are recommended for severe reactions.
- Respiratory distress syndrome: Acute respiratory distress syndrome (ARDS) has been reported with use; evaluate patients with pulmonary symptoms such as fever, lung infiltrates, or respiratory distress; withhold or discontinue pegfilgrastim if ARDS occurs.
- Splenic rupture: Rare cases of splenic rupture have been reported; patients must be instructed to report left upper quadrant pain or shoulder tip pain.

Disease-related concerns:

- Sickle cell disease: May precipitate sickle cell crises in patients with sickle cell disease; carefully evaluate potential risks and benefits.

Concurrent drug therapy issues:

- Cytotoxic chemotherapy: Do not use pegfilgrastim in the period 14 days before to 24 hours after administration of cytotoxic chemotherapy because of the potential sensitivity of rapidly dividing myeloid cells to cytotoxic chemotherapy.

Special populations:

- Adolescents: The 6 mg fixed dose should not be used in adolescents weighing <45 kg.
- Delayed myelosuppression: Use has not been evaluated with patients receiving chemotherapy associated with delayed myelosuppression (eg, nitrosoureas, mitomycin C).
- Pediatrics: Safety and efficacy in pediatric patients have not been established.
- Radiation therapy recipients: Use has not been evaluated for peripheral blood progenitor cell (PBPC) mobilization with patients receiving radiation therapy.
- Stem cell mobilization: Safety and efficacy have not been evaluated for peripheral blood progenitor cell (PBPC) mobilization.

Dosage form specific issues:

- Latex: The packaging (needle cover) contains latex.

Other warnings/precautions:

- Tumor growth factor: May potentially act as a growth factor for any tumor type, particularly myeloid malignancies; caution should be exercised when using in any malignancy with myeloid characteristics. Tumors of nonhematopoietic origin may have surface receptors for pegfilgrastim.

Geriatric ConsiderationsNot for patients <45 kg.
Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal studies have demonstrated adverse effects and fetal loss. There are no adequate and well-controlled studies in pregnant women; use only if potential benefit to mother justifies the potential risk to the fetus.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

>10%:

Cardiovascular: Peripheral edema (12%)

Central nervous system: Headache (16%)

Gastrointestinal: Vomiting (13%)

Neuromuscular & skeletal: Bone pain (31% to 57%), myalgia (21%), arthralgia (16%), weakness (13%)

1% to 10%: Gastrointestinal: Constipation (10%)

<1%, postmarketing, and/or case reports: Acute respiratory distress syndrome (ARDS), allergic reaction, anaphylaxis, erythema, fever, flushing, hyperleukocytosis, hypoxia, injection site pain, leukocytosis, rash, sickle cell crisis, splenic rupture, Sweet's syndrome (acute febrile dermatosis), urticaria. Cytopenias resulting from an antibody response to exogenous growth factors have been reported on rare occasions in patients treated with other recombinant growth factors.

Drug InteractionsThere are no known significant interactions.
Test InteractionsMay interfere with bone imaging studies; increased hematopoietic activity of the bone marrow may appear as transient positive bone imaging changes
Monitoring ParametersComplete blood count (with differential) and platelet count should be obtained prior to chemotherapy. Leukocytosis (white blood cell counts 100,000/mm^3) has been observed in <1% of patients receiving pegfilgrastim. Monitor platelets and hematocrit regularly. Evaluate fever, pulmonary infiltrates, and respiratory distress; evaluate for left upper abdominal pain, shoulder tip pain, or splenomegaly. Monitor for sickle cell crisis (in patients with sickle cell anemia).
Monitoring: Lab TestsComplete blood count (with differential) and platelet count should be obtained prior to chemotherapy. Leukocytosis (white blood cell counts 100,000/mm^3) has been observed in <1% of patients receiving pegfilgrastim. Monitor platelets and hematocrit regularly.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Neulasta®: 10 mg/mL (0.6 mL) [prefilled syringe; needle cover contains latex]

Generic AvailableNo
ManufacturerAmgen Inc
Pricing: U.S. (www.drugstore.com)

Solution (Neulasta)

6 mg/0.6 mL (0.6): $3331.13

Mechanism of ActionStimulates the production, maturation, and activation of neutrophils, pegfilgrastim activates neutrophils to increase both their migration and cytotoxicity. Pegfilgrastim has a prolonged duration of effect relative to filgrastim and a reduced renal clearance.
Pharmacodynamics/KineticsHalf-life elimination: SubQ: 15-80 hours
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentLithium may potentiate release of neutrophils from bone marrow
Index TermsG-CSF (PEG Conjugate); Granulocyte Colony Stimulating Factor (PEG Conjugate); NSC-725961; SD/01

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(peg in ter FEER on AL fa too aye)

U.S. Brand NamesPegasys®

Canadian Brand NamesPegasys®

Pharmacologic CategoryInterferon

Use: Labeled IndicationsTreatment of chronic hepatitis C (CHC), alone or in combination with ribavirin, in patients with compensated liver disease and histological evidence of cirrhosis (Child-Pugh class A) and patients with clinically-stable HIV disease; treatment of patients with HBeAg positive and HBeAg negative chronic hepatitis B with compensated liver disease and evidence of viral replication and liver inflammation

Dosing: Adults

Chronic hepatitis C (monoinfection or coinfection with HIV): SubQ:

Monotherapy: 180 mcg once weekly for 48 weeks

Combination therapy with ribavirin: Recommended dosage: 180 mcg once/week with ribavirin (Copegus®)

Duration of therapy: Monoinfection (based on genotype):

Genotype 1,4: 48 weeks

Genotype 2,3: 24 weeks

Duration of therapy: Coinfection: 48 weeks

Chronic hepatitis B: SubQ: 180 mcg once weekly for 48 weeks

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} <50 mL/minute: Use caution; monitor for toxicity

End-stage renal disease requiring hemodialysis: 135 mcg/week; monitor for toxicity

Dosing: Hepatic Impairment

HCV: ALT progressively rising above baseline: Decrease dose to 135 mcg/week. If ALT continues to rise or is accompanied by increased bilirubin or hepatic decompensation, discontinue therapy immediately.

HBV:

ALT >5 x ULN: Monitor LFTs more frequently; consider decreasing dose to 135 mcg/week or temporarily discontinuing (may resume after ALT flare subsides).

ALT >10 x ULN: Consider discontinuing.

Dosing: Adjustment for Toxicity

Dose modifications for adverse events/toxicity:

For moderate to severe adverse reactions: Initial: 135 mcg/week; may need decreased to 90 mcg/week in some cases

Based on hematologic parameters:

ANC <750/mm^3: 135 mcg/week

ANC <500/mm^3: Suspend therapy until >1000/mm^3, then restart at 90 mcg/week; monitor ANC

Platelet count <50,000/mm^3: 90 mcg/week

Platelet count <25,000/mm^3: Discontinue therapy

Depression (severity based on DSM-IV criteria):

Mild depression: No dosage adjustment required; evaluate once weekly by visit/phone call. If depression remains stable, continue weekly visits. If depression improves, resume normal visit schedule

Moderate depression: Decrease interferon dose to 90-135 mcg once/week; evaluate once weekly with an office visit at least every other week. If depression remains stable, consider psychiatric evaluation and continue with reduced dosing. If symptoms improve and remain stable for 4 weeks, resume normal visit schedule; continue reduced dosing or return to normal dose.

Severe depression: Discontinue interferon permanently. Obtain immediate psychiatric consultation. Discontinue ribavirin if using concurrently.

Administration: OtherSubQ: Administer in the abdomen or thigh. Rotate injection site. Do not use if solution contains particulate matter or is discolored. Discard unused solution. Administration should be done on the same day and at approximately the same time each week.

Dietary ConsiderationsAvoid ethanol use in patients with hepatitis C virus.

StorageStore in refrigerator at 2°C to 8°C (36°F to 46°F). Do not freeze or shake. Protect from light. Discard unused solution.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to polyethylene glycol (PEG), interferon alfa, or any component of the formulation; autoimmune hepatitis; decompensated liver disease in cirrhotic patients (Child-Pugh score >6); decompensated liver disease (Child-Pugh score ≥6, class B and C) in CHC coinfected with HIV; neonates and infants

Warnings/Precautions

Boxed warnings:

- Autoimmune disease: See “Disease-related concerns” below.

- Combination therapy with ribavirin: See “Concurrent drug therapy issues” below.

- Infectious disorders: See “Disease-related concerns” below.

- Ischemic disorders: See “Disease-related concerns” below.

- Neuropsychiatric disorders: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related t o adverse effects:

- Bone marrow suppression: May cause myelosuppression (including neutropenia, thrombocytopenia, lymphopenia, aplastic anemia). Use caution with baseline neutrophil count <1500/mm^3, platelet count <90,000/mm^3 or hemoglobin <10 g/dL. Discontinue therapy (at least temporarily) if ANC <500/mm^3 or platelet count <25,000/mm^3.

- CNS effects: Patients who experience dizziness, confusion, somnolence, or fatigue should use caution when performing tasks which require mental alertness (eg, operating machinery or driving).

- Dermatologic effects: Serious cutaneous reactions, including vesiculobullous eruptions, Stevens-Johnson syndrome, and exfoliative dermatitis, have been reported (rarely) with use, with or without ribavirin therapy; discontinue with signs or symptoms of severe skin reactions.

- Flu-like symptoms: Commonly associated with flu-like symptoms, including fever; rule out other causes/infection with persistent or high fever.

- Gastrointestinal effects: Gastrointestinal hemorrhage, ulcerative and hemorrhagic/ischemic colitis have been observed with interferon alfa treatment; may be severe and/or life-threatening; discontinue if symptoms of colitis (eg, abdominal pain, bloody diarrhea, and/or fever) develop.

- Hepatic effects: Hepatic decompensation and death have been associated with the use of alpha interferons including Pegasys®, in cirrhotic chronic hepatitis C patients; patients coinfected with HIV and receiving highly active antiretroviral therapy have shown an increased risk. Monitor hepatic function; discontinue if decompensation occurs (Child-Pugh score >6) in monoinfected patients and (Child-Pugh score ≥6, class B and C) in patients coinfected with HIV.

- Hypersensitivity reactions: Severe acute hypersensitivity reactions have occurred rarely; prompt discontinuation is advised.

- Infections: Serious and severe infections (bacterial, viral, and fungal) have been reported with treatment.

- Neuropsychiatric disorders: **[U.S. Boxed Warning]: Discontinue treatment with worsening or persistently severe signs/symptoms of neuropsychiatric disorders.** Severe psychiatric adverse effects (including depression, suicidal ideation, and suicide attempt) may occur. Avoid use in severe psychiatric disorders; use with extreme caution in patients with a history of depression.

- Ocular effects: Discontinue if new or worsening ophthalmologic disorders occur including retinal hemorrhages, cotton wool spots, and retinal artery or vein obstruction; visual exams are recommended in these instances, at the initiation of therapy, and periodically during therapy.

- Pancreatitis: Discontinue therapy if known or suspected pancreatitis develops.

- Pulmonary effects: Dyspnea, pulmonary infiltrates, pneumonia, bronchiolitis obliterans, interstitial pneumonia, and sarcoidosis, resulting in potentially fatal respiratory failure may occur with treatment. Discontinue with unexplained pulmonary infiltrates or evidence of impaired pulmonary function. Use with caution in patients with pulmonary dysfunction or a history of pulmonary disease.

Disease-related concerns:

- Anemia: Use with caution in patients with an increased risk for severe anemia (eg, spherocytosis, history of GI bleeding).

- Autoimmune disease: **[U.S. Boxed Warning]: Discontinue treatment with worsening or persistently severe signs/symptoms of autoimmune disorders;** use with caution in patients with autoimmune disease.

- Cardiovascular disease: Use with caution in patients with prior cardiovascular disease; hypertension, arrhythmia, chest pain, and MI have been observed with treatment.

- Diabetes: Use with caution in patients with diabetes mellitus; hyper/hypoglycemia have been reported; may require adjustments in antidiabetic medications; discontinue peginterferon alfa 2-a if unable to effectively manage diabetes with medication.

- Hepatitis B: In hepatitis B patients, flares (transient and potentially severe increases in serum ALT) may occur during or after treatment; more frequent monitoring of LFTs and a dose reduction are recommended. Discontinue if ALT elevation continues despite dose reduction or if increased bilirubin or hepatic decompensation occur.

- Infectious disorders: **[U.S. Boxed Warning]: Discontinue treatment in patients with worsening or persistently severe signs/symptoms of infectious disorders.**

- Ischemic disorders: **[U.S. Boxed Warning]: Discontinue treatment in patients with worsening or persistently severe signs/symptoms of ischemic (including radiographic changes or worsening hepatic function) disorders.**

- Renal impairment: Use with caution in patients with renal dysfunction (Cl_{cr} <50 mL/minute); monitor for signs/symptoms of toxicity (dosage adjustment required if toxicity occurs).

- Thyroid disorders: Use with caution in patients with pre-existing thyroid disease; thyroid disorders (hyper- or hypothyroidism) or exacerbations have been reported; discontinue peginterferon alfa 2-a if unable to effectively manage with medication.

Concurrent drug therapy issues:

Combination therapy with ribavirin: **[U.S. Boxed Warning]: Combination treatment with ribavirin may cause birth defects and/or fetal mortality; hemolytic anemia (which may worsen cardiac disease), genotoxicity, mutagenicity, and may possibly be carcinogenic.**

Special populations:

- Elderly: Use with caution in the elderly.

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Product variability: **Due to differences in dosage, patients should not change brands of interferon without the concurrence of their healthcare provider.**

Other warnings/precautions:

- Appropriate use: Safety and efficacy have not been established in patients who have failed other alpha interferon therapy, received organ transplants, been coinfected with HBV and HCV or HIV; or with HCV and HIV with a $CD4^+$ cell count <100 cells/microL, or been treated for >48 weeks.

Pregnancy Risk FactorC / X in combination with ribavirin

Pregnancy ConsiderationsReproduction studies with pegylated interferon alfa have not been conducted. Animal studies with nonpegylated interferon alfa-2b have demonstrated abortifacient effects. Disruption of the normal menstrual cycle was also observed in animal studies; therefore, the manufacturer recommends that reliable contraception is used in women of childbearing potential. Alfa interferon is endogenous to normal amniotic fluid. *In vitro* administration studies have reported that when administered to the mother, it does not cross the placenta. Case reports of use in pregnant women are limited. The Perinatal HIV Guidelines Working Group does not recommend that peginterferon-alfa be used during pregnancy. Peginterferon monotherapy should only be used in pregnancy when the potential benefit to the mother justifies the possible risk to the fetus. Combination therapy with ribavirin is contraindicated in pregnancy (refer to Ribavirin monograph); a pregnancy registry has been established for women inadvertently exposed to ribavirin while pregnant (800-593-2214).

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsBreast milk samples obtained from a lactating mother prior to and after administration of interferon alfa-2b showed that interferon alfa is present in breast milk and administration of the medication did not significantly affect endogenous levels. The AAP considers interferon alfa to be “usually compatible with breastfeeding”. Breast-feeding is not linked to the spread of hepatitis C virus; however, if nipples are cracked or bleeding, breast-feeding is not recommended. Mothers co-infected with HIV are discouraged from breast-feeding to decrease potential transmission of HIV.

Adverse Reactions**Note:** Percentages are reported for peginterferon alfa-2a in chronic hepatitis C (CHC) patients. Other percentages indicated as “with ribavirin” or “in HIV/CHC” or "in hepatitis B" are those which significantly exceed incidence reported for peginterferon monotherapy in CHC patients.

>10%:

Central nervous system: Headache (54%), fatigue (56%), pyrexia (37%; 41% with ribavirin; 54% in hepatitis B), insomnia (19%; 30% with ribavirin), depression (18%), dizziness (16%), irritability/anxiety/nervousness (19%; 33% with ribavirin), pain (11%)

Dermatologic: Alopecia (23%; 28% with ribavirin), pruritus (12%; 19% with ribavirin), dermatitis (16% with ribavirin)

Gastrointestinal: Nausea/vomiting (24%), anorexia (17%; 24% with ribavirin), diarrhea (16%), weight loss (16% in HIV/CHC), abdominal pain (15%)

Hematologic: Neutropenia (21%; 27% with ribavirin; 40% in HIV/CHC), lymphopenia (14% with ribavirin), anemia (11% with ribavirin; 14% in HIV/CHC)

Hepatic: ALT increases 5-10 x ULN during treatment (25% to 27% in hepatitis B); ALT increases >10 x ULN during treatment (12% to 18% in hepatitis B); ALT increases 5-10 x ULN after treatment (13% to 16% in hepatitis B); ALT increases >10 x ULN after treatment (7% to 12% in hepatitis B)

Local: Injection site reaction (22%)

Neuromuscular & skeletal: Weakness (56%; 65% with ribavirin), myalgia (37%), rigors (35%; 25% to 27% in hepatitis B), arthralgia (28%)

Respiratory: Dyspnea (13% with ribavirin)

1% to 10%:

Central nervous system: Concentration impaired (8%), memory impaired (5%), mood alteration (3%; 9% in HIV/CHC)

Dermatologic: Dermatitis (8%), rash (5%), dry skin (4%; 10% with ribavirin), eczema (1%; 5% with ribavirin)

Endocrine & metabolic: Hypothyroidism (3% to 4%), hyperthyroidism (≤1%)

Gastrointestinal: Xerostomia (6%), dyspepsia (<1%; 6% with ribavirin), weight loss (4%; 10% with ribavirin)

Hematologic: Thrombocytopenia (5%; 8% in HIV/CHC), lymphopenia (3%), anemia (2%)

Hepatic: Hepatic decompensation (2% in CHC/HIV)

Neuromuscular & skeletal: Back pain (9%)

Ocular: Blurred vision (4%)

Respiratory: Cough (4%; 10% with ribavirin), dyspnea (4%), exertional dyspnea (4% with ribavirin)

Miscellaneous: Diaphoresis (6%), bacterial infection (3%; 5% in HIV/CHC)

≤1%, postmarketing, and/or case reports: Aggression, anaphylaxis, angioedema, angina, aplastic anemia, arrhythmia, autoimmune disorders, bronchiolitis obliterans, bronchoconstriction, cerebral hemorrhage, chest pain, cholangitis, colitis, coma, corneal ulcer, cotton wool spots, diabetes mellitus, endocarditis, erythema multiforme major, exertional dyspnea, exfoliative dermatitis, fatty liver, gastrointestinal bleeding, hallucination, hearing impairment, hearing loss, hemoglobin decreased, hematocrit decreased, hepatic dysfunction, hepatic decompensation, hyper-/hypoglycemia, hypersensitivity reactions, hypertension, influenza, interstitial pneumonitis, MI, myositis, optic neuritis, papilledema, pancreatitis, peptic ulcer, peripheral neuropathy, pneumonia, psychiatric disorder, psychosis, pulmonary embolism, pulmonary infiltrates, retinal hemorrhage, retinopathy, rheumatoid arthritis, sarcoidosis, Stevens-Johnson syndrome, substance overdose, suicidal ideation, suicide, supraventricular arrhythmia, systemic lupus erythematosus, thrombotic thrombocytopenic purpura, urticaria, vesiculobullous eruptions, vision decreased/loss

Metabolism/Transport Effects **Inhibits** CYP1A2 (weak)

Drug Interactions

Aldesleukin: Interferons (Alfa) may enhance the adverse/toxic effect of Aldesleukin. In particular, risks of myocardial and renal toxicity may be increased by this combination. *Risk D: Consider therapy modification*

Ribavirin: Interferons (Alfa) may enhance the adverse/toxic effect of Ribavirin. Hemolytic anemia has been observed. *Risk C: Monitor therapy*

Theophylline Derivatives: Interferons may decrease the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Zidovudine: Interferons may enhance the adverse/toxic effect of Zidovudine. Interferons may decrease the metabolism of Zidovudine. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions Ethanol: Avoid use in patients with hepatitis C virus.

Monitoring Parameters Prior to treatment, pregnancy screening should occur for women of childbearing age who are receiving treatment or who have male partners who are receiving treatment. In combination therapy with ribavirin, pregnancy tests should continue monthly up to 6 months after discontinuation of therapy. Standard hematological tests should be performed prior to therapy, at week 2, and periodically. Standard biochemical tests should be performed prior to therapy, at week 4, and periodically. Evaluate for depression and other psychiatric symptoms before and during therapy; baseline eye examination and periodically in patients with baseline disorders; baseline echocardiogram in patients with cardiac disease; serum HCV RNA levels after 12 weeks of treatment. Consider discontinuing treatment if virologic tests indicate no response by week 12.

Clinical studies tested as follows: CBC (including hemoglobin, WBC, and platelets) and chemistries (including liver function tests and uric acid) measured at weeks 1, 2, 4, 6, and 8, and then every 4-6 weeks (more frequently if abnormal) weeks; TSH measured every 12 weeks

In addition, the following baseline values were used as entrance criteria:

Platelet count ≥90,000/mm^3 (as low as 75,000/mm^3 in patients with cirrhosis or transition to cirrhosis)

ANC ≥1500/mm^3

Serum creatinine <1.5 times ULN

TSH and T$_4$ within normal limits or adequately controlled

CD4$^+$ cell count ≥200 cells/microL or CD4$^+$ cell count ≥100 cells/ microL, but <200 cells/ microL and HIV-1 RNA <5000 copies/mL in CHC patients coinfected with HIV

Hemoglobin ≥12 g/dL for women and ≥13 g/dL for men in CHC monoinfected patients

Hemoglobin ≥11 g/dL for women and ≥12 g/dL for men in CHC patients coinfected with HIV

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess results of laboratory tests prior to and periodically during therapy. Evaluate for depression and other psychiatric symptoms before and during therapy; baseline eye examination and periodically in patients with baseline disorders; baseline echocardiogram in patients with cardiac disease; assess therapeutic effectiveness and adverse response at beginning of and at regular intervals during therapy. Teach patient proper use if self-administered (appropriate injection technique and syringe/needle disposal), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsStandard hematological tests should be performed prior to therapy, at week 2, and periodically. Standard biochemical tests should be performed prior to therapy, at week 4, and periodically. Baseline eye examination and periodically in patients with baseline disorders; baseline echocardiogram in patients with cardiac disease; serum HCV RNA levels after 12 weeks of treatment

Clinical studies tested as follows: CBC (including hemoglobin, WBC, and platelets) and chemistries (including liver function tests and uric acid) measured at weeks 1, 2, 4, 6, and 8, and then every 4 weeks; TSH measured every 12 weeks

In addition, the following baseline values were used as entrance criteria:

Platelet count ≥ 90,000/mm^3 (as low as 75,000/mm^3 in patients with cirrhosis or transition to cirrhosis)

ANC ≥ 1500/mm^3

Serum creatinine <1.5 times ULN

TSH and T_4 within normal limits or adequately controlled

Consider discontinuing treatment if virologic tests indicate no response by week 12.

Patient EducationInform prescriber of all prescriptions, OTC medications, or herbal products you are taking, and any allergies you have. Do not take any new medication during therapy without consulting prescriber. This medication must be given by injection; if self-administered, follow exact instructions for injection and syringe/needle disposal. Avoid alcohol. You will need laboratory tests and ophthalmic exams prior to and during therapy. May cause headache, insomnia, dizziness (use caution when driving or engaging in potentially hazardous tasks until response to drug is known); loss of hair (will grow back after therapy); nausea or anorexia (small frequent meals or frequent mouth care may help); diarrhea (boiled milk, buttermilk, or yogurt may help); weakness, fatigue; muscle, skeletal, or joint pain; or increased perspiration. Report any severe or persistent adverse effects, including nausea, vomiting, or abdominal or back pain; severe depression, anxiety, or suicidal ideation; skin rash; pain, redness, or swelling at injection site; signs of infection; unusual bleeding or bruising; changes in vision; severe shivering (rigors); or chest pain, palpitations, or respiratory difficulty. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber for appropriate contraceptive measures. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection solution:

Pegasys®

180 mcg/0.5 mL (0.5 mL) [prefilled syringe; contains benzyl alcohol and polysorbate 80; packaged with needles and alcohol swabs]

180 mcg/mL (1 mL) [vial; contains benzyl alcohol and polysorbate 80]

Generic AvailableNo

ManufacturerRoche Pharmaceuticals

Pricing: U.S. (www.drugstore.com)

180 mcg/0.5 mL (1): $2017.16

Solution (Pegasys)

180 mcg/mL (1): $564.17

Mechanism of ActionAlpha interferons are a family of proteins, produced by nucleated cells, that have antiviral, antiproliferative, and immune-regulating activity. There are 16 known subtypes of alpha interferons. Interferons interact with cells through high affinity cell surface receptors. Following activation, multiple effects can be detected including induction of gene transcription. Inhibits cellular growth, alters the state of cellular differentiation, interferes with oncogene expression, alters cell surface antigen expression, increases phagocytic activity of macrophages, and augments cytotoxicity of lymphocytes for target cells.

Pharmacodynamics/Kinetics

Half-life elimination: Terminal: 50-160 hours; increased with renal dysfunction

Time to peak, serum: 72-96 hours

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSevere psychiatric adverse effects (including depression, suicidal ideation, and suicide attempt) may occur. May also cause sedation, anxiety, emotional lability, irritability, insomnia, dizziness, and impaired concentration.

Mental Health: Effects on Psychiatric TreatmentContraindicated in those with severe psychiatric disorder. Gastrointestinal side effects are common; use caution with SSRIs, valproic acid, and lithium. Flu-like symptoms are common; take this into consideration if also concerned about SSRI discontinuation syndrome. A case of agranulocytosis has been reported with concurrent use of clozapine; monitor.

Index TermsInterferon Alfa-2a (PEG Conjugate); Pegylated Interferon Alfa-2a

Pronunciation(peg in ter FEER on AL fa too bee & rye ba VYE rin)
Canadian Brand NamesPegasys; Pegasys® RBV; Pegetron™
Pharmacologic CategoryAntiviral Agent; Interferon
Use: Labeled IndicationsCombination therapy for the treatment of chronic hepatitis C in patients with compensated liver disease
Dosing: Adults

Chronic hepatitis C: Recommended dosage of combination therapy:

Intron® A: SubQ: 1.5 mcg/kg/week

and

Rebetol®: Oral:

≤64 kg: 800 mg/day (two 200 mg capsules in the morning and two 200 mg capsules in the evening)

64-84 kg: 1000 mg/day (two 200 mg capsules in the morning and three 200 mg capsules in the evening)

≥85 kg: 1200 mg/day (three 200 mg capsules in the morning and three 200 mg capsules in the evening)

Note: Treatment duration may vary. Consult current guidelines and literature.

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentAvoid use in patients with Cl_{cr} <50 mL/minute. Permanently discontinue therapy in any patient with a serum creatinine >2 mg/dL.
Dosing: Hepatic ImpairmentNot for use in patients with severe hepatic impairment. Reduce ribavirin dose to 600 mg/day in any patient with a indirect bilirubin >5 mg/dL. Permanently discontinue therapy in any patient with a direct bilirubin >2.5 times ULN or indirect bilirubin >4 mg/dL (for >4 weeks); AST/ALT 2 times baseline **and** 10 times ULN.
Dosing: Adjustment for Toxicity

Hemoglobin:

Hemoglobin <10 g/dL: Continue current peginterferon alfa-2b dose; decrease ribavirin dose by 200 mg/day

Hemoglobin <8.5 g/dL: Permanently discontinue peginterferon alfa-2b and ribavirin

Hemoglobin decrease >2 g/dL in any 4-week period and stable cardiac disease: Decrease peginterferon alfa-2b dose by half; decrease ribavirin dose by 200 mg per day. Hemoglobin <12 g/dL after ribavirin dose is decreased: Permanently discontinue both peginterferon alfa-2b and ribavirin.

White blood cells:

WBC <1.5 x 10^9/L: Decrease peginterferon alfa-2b dose by half

WBC <1.0 x 10^9/L: Permanently discontinue peginterferon alfa-2b and ribavirin

Neutrophils:

Neutrophils <0.75 x 10^9/L: Decrease peginterferon alfa-2b dose by half

Neutrophils <0.5 x 10^9/L: Permanently discontinue peginterferon alfa-2b and ribavirin

Platelets:

Platelet count <50 x 10^9/L: Decrease peginterferon alfa-2b dose by half

Platelet count <25 x 10^9/L: Permanently discontinue peginterferon alfa-2b and ribavirin

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralCapsule should not be opened, crushed, chewed, or broken.
Administration: OtherSee individual agents.
Dietary ConsiderationsTake oral formulation without regard to food, but always in a consistent manner with respect to food intake (ie, always take with food or always take on an empty stomach).

Storage

Rebetol® capsule/Intron® A injection combination package: Store under refrigeration between 2°C and 8°C (36°F and 46°F). When the package is separated:

Rebetol® capsules: Store under refrigeration between 2°C and 8°C (36°F and 46°F) or at 25°C (77°F); excursions are permitted between 15°C and 30°C (59°F and 86°F).

Peginterferon injection: Store vial/carton under refrigeration between 2°C and 8°C (36°F and 46°F).

Reconstitution Peginterferon alpha-2b powder for injection should be reconstituted with 0.7 mL of diluent (provided). Roll gentle to form solution; do not shake. Vials are calibrated to provide appropriate dose in a volume of 0.5 mL of resulting solution. Use within 3 hours of reconstitution.

Restrictions Not available in U.S.

Contraindications Hypersensitivity to polyethylene glycol (PEG), interferon alfa, ribavirin, or any component of the formulation; autoimmune hepatitis; decompensated liver disease; previous treatment with interferon; severe psychiatric disorder; males with a pregnant female partner; pregnancy

Allergy Considerations

- Interferon Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Bone marrow suppression: Anemia has been observed in patients receiving the interferon/ribavirin combination.
- Colitis: Discontinue ribavirin therapy in suspected/confirmed colitis.
- Dental/periodontal disorders: Have been reported with ribavirin and interferon therapy; patients should be instructed to brush teeth twice daily and have regular dental exams.
- Hemolytic anemia: Hemolytic anemia is a significant toxicity, usually occurring within 1-2 weeks, and may worsen underlying cardiac disease; use caution and assess cardiac disease before initiation. Patients with renal dysfunction and/or those >50 years of age should be carefully assessed for development of anemia. If any deterioration in cardiovascular status occurs, discontinue therapy.
- Neuropsychiatric disorders: Interferon alfa-2b may cause severe psychiatric adverse events (psychosis, mania, depression, suicidal behavior/ideation) in patients with and without previous psychiatric symptoms, avoid use in severe psychiatric disorders or in patients with a history of depression; careful neuropsychiatric monitoring is required during therapy. Suicidal ideation or attempts may occur more frequently in pediatric patients when compared to adults. Severe psychiatric events have also occurred with ribavirin.
- Ocular effects: Ophthalmologic disorders (including retinal hemorrhages, cotton wool spots, and retinal artery or vein obstruction) have occurred in patients using other alpha interferons. Prior to start of therapy, visual exams are recommended for patients with diabetes mellitus or hypertension.
- Pancreatitis: Discontinue ribavirin therapy in suspected/confirmed pancreatitis.
- Rash: Transient rashes do not necessitate interruption of therapy.

Disease-related concerns:

- Autoimmune disease: Peginterferon alfa-2b may cause or aggravate fatal or life-threatening autoimmune disorders; treatment should be discontinued in patients with worsening or persistently severe signs/symptoms.
- Bone marrow suppression: Use peginterferon alfa-2b with caution in patients with low peripheral blood counts or myelosuppression, including concurrent use of myelosuppressive therapy. Discontinue therapy when significant decreases in neutrophil ($<0.5 \times 10^9$/L) or platelet counts ($<50{,}000/\text{mm}^3$)
- Cardiovascular disease: Use peginterferon alfa-2b with caution in patients with cardiac disease (ischemic or thromboembolic), hypertension or arrhythmias.
- Endocrine disorders: Use peginterferon alfa-2b with caution in patients with endocrine disorders.
- Hepatic impairment: Interferon alfa-2b treatment should be discontinued in patients who develop worsening of hepatic function; use with caution in patients with hepatic impairment. Safety and efficacy of ribavirin have not been established in patients with decompensated liver disease.
- Hepatitis: Safety and efficacy of ribavirin have not been established in patients with concurrent hepatitis B virus.
- HIV: Safety and efficacy of ribavirin have not been established in patients with HIV exposure.
- Infectious disorders: Peginterferon alfa-2b may cause or aggravate fatal or life-threatening infectious disorders; discontinue if signs and symptoms occur.
- Ischemic disorders: Peginterferon alfa-2b may cause or aggravate fatal or life-threatening ischemic disorders.
- Renal impairment: Use peginterferon alfa-2b with caution in patients with renal impairment; use is not recommended if $Cl_{cr}<50$ mL/minute; monitor for signs/symptoms of toxicity (dosage adjustment required if toxicity occurs).
- Respiratory disease: Use with caution in patients with pulmonary disease; pulmonary symptoms have been associated with administration.

- Sarcoidosis: Use ribavirin with caution in patients with sarcoidosis (exacerbation reported).

Concurrent drug therapy issues:

- Medications causing lactic acidosis: Use with caution in patient receiving medications which may cause lactic acidosis (eg, nucleoside analogues).

Special populations:

- Elderly: Use with caution in elderly patients; higher frequency of anemia; take renal function into consideration before initiating.

- Organ transplant recipients: Safety and efficacy of ribavirin have not been established in organ transplant patients.

- Pediatrics: Safety and efficacy have not been established in children.

- Pregnancy: Avoid pregnancy in female patients and female partners of patients during ribavirin therapy by using two effective forms of contraception; continue contraceptive measures for at least 6 months after completion of therapy. If patient or female partner becomes pregnant during treatment, she should be counseled about potential risks of exposure. Negative pregnancy test is required before initiation and monthly thereafter.

Dosage form specific issues:

- Product variability: **Due to differences in dosage, patients should not change brands of interferons.**

Other warnings/precautions:

- Appropriate use: Safety and efficacy have not been established in patients who have failed other alpha interferon (including peginterferon alfa-2b) therapy, have received organ transplants, have been infected with HIV or hepatitis B, or have received treatment for >48 weeks.

Pregnancy Risk FactorX

Pregnancy ConsiderationsAbortifacient and teratogenic effects have been reported in women receiving interferons. Women of childbearing potential should not be treated unless two reliable forms of contraception are used. In addition, male patients and their female partners must also use two reliable forms of contraception. Pregnancy must be avoided during treatment and for 6 months following therapy.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions**Note:** Adverse reactions listed are specific to combination regimen in previously untreated hepatitis patients. See individual agents for additional adverse reactions reported with each agent during therapy for other diseases.

>10%:

Central nervous system: Fatigue (62% to 64%), headache (58% to 62%), fever (44% to 46%), rigors (45% to 48%), insomnia (40%), irritability (34% to 35%), depression (29% to 34%), impaired concentration (16% to 17%), anxiety (15%), emotional lability (11%)

Dermatologic: Alopecia (29% to 36%), pruritus (26% to 29%), rash (22% to 24%), dry skin (18% to 24%)

Endocrine & metabolic: Weight loss (17% to 29%)

Gastrointestinal: Nausea (36% to 43%), anorexia (29% to 32%), diarrhea (16% to 22%), vomiting (14%), abdominal pain (12% to 13%), xerostomia (8% to 12%)

Local: Injection site reaction (58% to 59%), injection site inflammation (25% to 27%)

Neuromuscular & skeletal: Myalgia (48% to 56%), arthralgia (34%), musculoskeletal pain (17% to 21%), weakness (16% to 18%)

Respiratory: Dyspnea (23% to 26%), cough (15% to 17%), pharyngitis (11% to 12%)

Miscellaneous: Flu-like syndrome (24% to 27%)

1% to 10%:

Cardiovascular: Chest pain, tachycardia

Central nervous system: Agitation, nervousness; suicidal ideation and suicide attempt have been reported in up to 1.2% of patients

Endocrine & metabolic: Thyroid abnormalities (hyper-/hypothyroidism), menstrual disorder

Gastrointestinal: Constipation, dyspepsia, right upper quadrant pain, taste perversion

Local: Injection site pain

Respiratory: Nonproductive cough, rhinitis

<1% (reported with other interferon preparations and/or ribavirin; limited to important or life-threatening): Acute hypersensitivity reactions, anaphylaxis, angioedema, aplastic anemia (very rare), arrhythmia, bronchoconstriction, cardiomyopathy, cotton wool spots, diabetes, hearing loss, hepatotoxic reactions, hypotension, MI, pneumonia, pneumonitis, retinal hemorrhages, retinal artery or vein obstruction, severe psychiatric reactions, suicidal behavior, suicidal ideation, tinnitus, urticaria; rare cases of autoimmune diseases including vasculitis, polyarteritis reaction, rheumatoid arthritis, lupus erythematosus, and Raynaud's phenomenon

Postmarketing and/or case reports: Dental disorders, hypertriglyceridemia, nephrotic syndrome, pancreatitis, periodontal disorders, hallucinations, renal failure, sarcoidosis (including exacerbations of sarcoidosis)

Metabolism/Transport EffectsPeginterferon Alfa-2a: **Inhibits** CYP1A2 (weak)

Drug Interactions

Aldesleukin: Interferons (Alfa) may enhance the adverse/toxic effect of Aldesleukin. In particular, risks of myocardial and renal toxicity may be increased by this combination. *Risk D: Consider therapy modification*

Influenza Virus Vaccine: Antiviral Agents (Influenza A and B) may diminish the therapeutic effect of Influenza Virus Vaccine. This only pertains to live, attentuated influenza virus vaccine. *Risk D: Consider therapy modification*

Interferons (Alfa): May enhance the adverse/toxic effect of Ribavirin. Hemolytic anemia has been observed. *Risk C: Monitor therapy*

Reverse Transcriptase Inhibitors (Nucleoside): Ribavirin may enhance the hepatotoxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Lactic acidosis may occur. *Risk D: Consider therapy modification*

Ribavirin: Interferons (Alfa) may enhance the adverse/toxic effect of Ribavirin. Hemolytic anemia has been observed. *Risk C: Monitor therapy*

Theophylline Derivatives: Interferons may decrease the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Zidovudine: Interferons may enhance the adverse/toxic effect of Zidovudine. Interferons may decrease the metabolism of Zidovudine. *Risk C: Monitor therapy*

Monitoring ParametersObtain pretreatment CBC, liver function tests, TSH, and electrolytes, then monitor routinely throughout therapy (at 2- and 4 weeks, more frequently if indicated); discontinue if WBC <1.0 x 10^9/L, neutrophils <0.5 x 10^9/L, platelets <25 x 10^9/L, or if hemoglobin <8.5 g/dL (in cardiac patients, discontinue if hemoglobin <12 g/dL after 4 weeks of dosage reduction). Pretreatment and monthly pregnancy test for women of childbearing age. Baseline chest x-ray, ECG, weight; patients with pre-existing cardiac abnormalities, or in advanced stages of cancer should have ECGs taken before and during treatment; reticulocyte count, I & O; dental exams

Reference RangePeak serum level after I.V. infusion of 10 million units: 546 units/mL

Early viral response (EVR): >2 log decrease in HCV RNA after 12 weeks of treatment

End of treatment response (ETR): Absence of detectable HCV RNA at end of the recommended treatment period

Sustained treatment response (STR): Absence of HCV RNA in the serum 6 months following completion of full treatment course

Monitoring: Lab TestsObtain pretreatment CBC, liver function tests, TSH, and electrolytes, then monitor routinely throughout therapy (at 2- and 4 weeks, more frequently if indicated); discontinue if WBC <1.0 x 10^9/L, neutrophils <0.5 x 10^9/L, platelets <25 x 10^9/L, or if hemoglobin <8.5 g/dL (in cardiac patients, discontinue if hemoglobin <12 g/dL after 4 weeks of dosage reduction). Pretreatment and monthly pregnancy test for women of childbearing age. Baseline chest x-ray, ECG, weight; patients with pre-existing cardiac abnormalities, or in advanced stages of cancer should have ECGs taken before and during treatment; reticulocyte count, I & O

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Combination package:

Injection, powder for reconstitution (Peginterferon alfa-2b): 50 mcg/0.5 mL

Capsules: Ribavirin (Rebetol®): 200 mg (56s)

Injection, powder for reconstitution (Peginterferon alfa-2b): 80 mcg/0.5 mL

Capsules: Ribavirin (Rebetol®): 200 mg (56s)

Injection, powder for reconstitution (Peginterferon alfa-2b): 100 mcg/0.5 mL

Capsules: Ribavirin (Rebetol®): 200 mg (70s)

Injection, powder for reconstitution (Peginterferon alfa-2b): 120 mcg/0.5 mL

Capsules: Ribavirin (Rebetol®): 200 mg (70s)

Injection, powder for reconstitution (Peginterferon alfa-2b): 150 mcg/0.5 mL

Capsules: Ribavirin (Rebetol®): 200 mg (84s)

Mechanism of Action

Peginterferon Alfa-2b: Alpha interferons are a family of proteins, produced by nucleated cells, that have antiviral, antiproliferative, and immune-regulating activity. There are 16 known subtypes of alpha interferons. Interferons interact with cells through high affinity cell surface receptors. Following activation, multiple effects can be detected including induction of gene transcription. Inhibits cellular growth, alters the state of cellular differentiation, interferes with oncogene expression, alters cell surface antigen expression, increases phagocytic activity of macrophages, and augments cytotoxicity of lymphocytes for target cells.

Ribavirin: Inhibits replication of RNA and DNA viruses; inhibits influenza virus RNA polymerase activity and inhibits the initiation and elongation of RNA fragments resulting in inhibition of viral protein synthesis.

Pharmacodynamics/KineticsSee individual agents.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and metallic taste.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSevere psychiatric disorders, including depression and suicidal behavior, have been associated with interferon use. Careful neuropsychiatric monitoring is recommended.

Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

Sound-alike/look-alike issues:

Peginterferon alfa-2b may be confused with interferon alfa-2a, interferon alfa-2b, interferon alfa-n3, peginterferon alfa-2a

PegIntron™ may be confused with Intron® A

International issues:

Peginterferon alfa-2b may be confused with interferon alpha multi-subtype which is available in international markets

Pronunciation(peg in ter FEER on AL fa too bee)

U.S. Brand NamesPegIntron™

Canadian Brand NamesPegIntron™

Pharmacologic CategoryInterferon

Use: Labeled IndicationsTreatment of chronic hepatitis C (in combination with ribavirin) in patients who have never received alfa interferons and have compensated liver disease; treatment of chronic hepatitis C (as monotherapy) in adult patients who have never received alfa interferons

Use: Unlabeled/InvestigationalTreatment of advanced melanoma

Dosing: Adults

Chronic hepatitis C: SubQ: Administer dose once weekly; **Note:** Treatment duration may vary. Consult current guidelines and literature. Discontinue after 6 months of treatment if HCV viral levels remain detectable.

Monotherapy: Initial: 1 mcg/kg/week

- ≤45 kg: 40 mcg once weekly
- 46-56 kg: 50 mcg once weekly
- 57-72 kg: 64 mcg once weekly
- 73-88 kg: 80 mcg once weekly
- 89-106 kg: 96 mcg once weekly
- 107-136 kg: 120 mcg once weekly
- 137-160 kg: 150 mcg once weekly

Combination therapy with ribavirin: Initial: 1.5 mcg/kg/week

- <40 kg: 50 mcg once weekly (with ribavirin 800 mg/day)
- 40-50 kg: 64 mcg once weekly (with ribavirin 800 mg/day)
- 51-60 kg: 80 mcg once weekly (with ribavirin 800 mg/day)
- 61-65 kg: 96 mcg once weekly (with ribavirin 800 mg/day)
- 66-75 kg: 96 mcg once weekly (with ribavirin 1000 mg/day)
- 76-85 kg: 120 mcg once weekly (with ribavirin 1000 mg/day)
- 86-105 kg: 150 mcg once weekly (with ribavirin 1200 mg/day)
- >105 kg: 150 mcg once weekly (with ribavirin 1400 mg/day)

Advanced melanoma (unlabeled use): 6 mcg/kg weekly for 8 weeks, followed by 3 mcg/kg weekly for a total of 5 years (Eggermont, 2008).

Dosing: ElderlyMay require dosage reduction based upon renal dysfunction, but no established guidelines are available.

Dosing: Pediatric**Chronic hepatitis C:** Children ≥3 years: SubQ: Combination therapy with ribavirin: 60 mcg/m^2 once weekly (in combination with ribavirin 15 mg/kg/day in 2 divided doses); **Note:** Children who reach their 18th birthday during treatment should remain on the pediatric regimen. Discontinue combination therapy at 12 weeks if HCV-RNA decreases <2 $\log_{10}$ (compared to pretreatment) or if detectable HCV-RNA at 24 weeks.

Dosing: Renal Impairment
Peginterferon alfa-2b monotherapy:

Cl_{cr} 30-50 mL/minute: Reduce dose by 25%

Cl_{cr} 10-29 mL/minute: Reduce dose by 50%

Hemodialysis: Reduce dose by 50%

Discontinue use if renal function declines during treatment.

Peginterferon alfa-2b combination with ribavirin:

Children: Serum creatinine >2 mg/dL: Discontinue treatment.

Adults: Cl_{cr} <50 mL/minute: Combination therapy with ribavirin is not recommended.

Dosing: Hepatic ImpairmentContraindicated in decompensated liver disease

Dosing: Adjustment for ToxicityFor serious adverse reaction during treatment, modify dosage or discontinue; discontinue for persistent serious adverse reaction:

Dosage adjustment for depression (severity based upon DSM-IV criteria):

Mild depression: No dosage adjustment required; evaluate once weekly by visit/phone call. If depression remains stable, continue weekly visits. If depression improves, resume normal visit schedule.

Moderate depression: Adults: Decrease peginterferon alfa-2b dose by 50%; Children: Decrease peginterferon alfa-2b dose to 40 mcg/m^2/week, may further decrease to 20 mcg/m^2/week if needed. Evaluate once weekly with an office visit at least every other week. If depression remains stable, consider psychiatric evaluation and continue with reduced dosing. If symptoms improve and remain stable for 4 weeks, resume normal visit schedule; continue reduced dosing or return to normal dose.

Severe depression: Discontinue peginterferon alfa-2b and ribavirin permanently. Obtain immediate psychiatric consultation.

Dosage adjustment in hematologic toxicity:

Children:

Hemoglobin decrease ≥2 g/dL in any 4-week period in patients with pre-existing cardiac disease: Monitor and evaluate weekly.

Hemoglobin <10 g/dL: Decrease ribavirin dose to 12 mg/kg/day; may further reduce to 8 mg/kg/day.

WBC <1.5 x 10^9/L, neutrophils <0.75 x 10^9/L, or platelets <70 x 10^9/L: Reduce peginterferon alfa-2b dose to 40 mcg/m^2/week; may further reduce to 20 mcg/m^2/week.

Hemoglobin <8.5 g/dL, WBC <1.0 x 10^9/L, neutrophils <0.5 x 10^9/L, or platelets <50 x 10^9/L: Permanently discontinue peginterferon alfa-2b and ribavirin.

Adults:

Hemoglobin decrease >2 g/dL in any 4-week period and stable cardiac disease: Decrease peginterferon alfa-2b dose by 50%; decrease ribavirin dose by 200 mg/day. Hemoglobin <12 g/dL after dose reductions: Permanently discontinue both peginterferon alfa-2b and ribavirin.

Hemoglobin <10 g/dL in patients with cardiac disease: Reduce peginterferon alfa-2b dose by 50%; decrease ribavirin dose by 200 mg/day.

WBC <1.5 x 10^9/L, neutrophils <0.75 x 10^9/L, or platelets <80 x 10^9/L: Reduce peginterferon alfa-2b dose by 50%.

Hemoglobin <8.5 g/dL, WBC <1.0 x 10^9/L, neutrophils <0.5 x 10^9/L, or platelets <50 x 10^9/L: Permanently discontinue peginterferon alfa-2b and ribavirin.

Administration: OtherFor SubQ administration; rotate injection site; thigh, outer surface of upper arm, and abdomen are preferred injection sites; do not inject near navel or waistline; patients who are thin should only use thigh or upper arm. Do not inject into bruised, infected, irritated, red, or scarred skin.

StoragePrior to reconstitution, store Redipen™ at 2°C to 8°C (36°F to 46°F). Store vials at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Once reconstituted each product should be used immediately or may be stored for ≤24 hours at 2°C to 8°C (36°F to 46°F); do not freeze. Products do not contain preservative.

Reconstitution

Redipen™: Hold cartridge upright and press the two halves together until there is a "click". Gently invert to mix; do not shake.

Vial: Add 0.7 mL of sterile water for injection, USP (supplied diluent) to the vial. Gently swirl. Do not re-enter vial after dose removed. Discard unused portion.

CompatibilityDo not mix with any other medicines.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity (including urticaria, angioedema, bronchoconstriction, anaphylaxis, Stevens Johnson syndrome and toxic epidermal necrolysis) to interferons, or any component of the formulation; autoimmune hepatitis; decompensated liver disease (Child-Pugh score >6, classes B and C) in cirrhotic chronic hepatitis C (prior to or during treatment)

Combination therapy with peginterferon alfa-2b and ribavirin is also contraindicated in pregnancy, women who may become pregnant, males with pregnant partners; hemoglobinopathies (eg, thalassemia major, sickle-cell anemia); renal dysfunction (Cl_{cr} <50 mL/minute)

Warnings/Precautions

Boxed warnings:

- Autoimmune disease: See "Disease-related concerns" below.
- Combination therapy with ribavirin: See "Concurrent drug therapy issues" below.
- Infectious disorders: See "Disease-related concerns" below.
- Ischemic disorders: See "Disease-related concerns" below.
- Neuropsychiatric disorders: See "Concerns related to adverse effects" below.
- Pregnancy: See "Special populations" below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: Causes bone marrow suppression, including potentially severe cytopenias; alfa interferons may (rarely) cause aplastic anemia. Use with caution in patients who are chronically immunosuppressed, with low peripheral blood counts or myelosuppression, including concurrent use of myelosuppressive therapy. Dosage modification may be necessary for hematologic toxicity. Combination therapy with ribavirin may potentiate the neutropenic effects of alfa interferons. When used in combination with ribavirin, an increased incidence of anemia was observed when using ribavirin weight-based dosing, as compared to flat-dose ribavirin.
- Colitis: Ulcerative or hemorrhagic/ischemic colitis has been observed with alfa interferons; discontinue therapy if signs of colitis (abdominal pain, bloody diarrhea, fever) develop.
- Dental/periodontal disorders: Have been reported with combination therapy; dry mouth may affect teeth and mucous membranes. Instruct patients to brush teeth twice daily; encourage regular dental exams.
- Hypersensitivity: Acute hypersensitivity reactions and cutaneous reactions have been reported (rarely) with alfa interferons; prompt discontinuation is recommended. Transient rashes do not require interruption of therapy.
- Hypertriglyceridemia: Has been reported; monitor; discontinue if severe (triglycerides >1000 mg/dL), particularly if combined with symptoms of pancreatitis.
- Neuropsychiatric disorders: **[U.S. Boxed Warning]: May cause or aggravate severe neuropsychiatric adverse events in patients with and without a history of psychiatric disorder;** addiction relapse, aggression, depression, homicidal ideation and suicidal behavior/ideation have been observed with peginterferon alfa-2b; bipolar disorder, hallucinations, mania, and psychosis have been observed with other alfa interferons. Use with extreme caution in patients with a history of psychiatric disorders, including depression. Monitor all patients for evidence of depression; patients who develop psychiatric disorders should be monitored during and for 6 months after completion of therapy; discontinue treatment if psychiatric symptoms persist, worsen or if suicidal behavior develops. Higher doses may be associated with the development of encephalopathy (higher risk in elderly patients).
- Ophthalmic effects: Ophthalmologic disorders (including decreased/loss of vision, macular edema, retinal hemorrhages, optic neuritis, papilledema, cotton wool spots, and retinal artery or vein thrombosis) have occurred with peginterferon alfa-2b and/or with other alfa interferons. Prior to start of therapy, ophthalmic exams are recommended for all patients; patients with diabetic or hypertensive retinopathy should have periodic ophthalmic exams during treatment. Discontinue treatment with new or worsening ophthalmic disorder.
- Pancreatitis: Pancreatitis has been observed with alfa interferon therapy; discontinue therapy if known or suspected pancreatitis develops.
- Pulmonary effects: May cause or aggravate dyspnea, pulmonary infiltrates, pneumonia, bronchiolitis obliterans, interstitial pneumonitis, and sarcoidosis which may result in respiratory failure; may recur upon rechallenge with treatment; monitor closely.

Disease-related concerns:

- Autoimmune disease: **[U.S. Boxed Warning]: May cause or exacerbate autoimmune disorders; monitor closely; discontinue treatment in patients with worsening or persistently severe signs/symptoms of autoimmune disease.** Thyroiditis, thrombotic thrombocytopenic purpura, idiopathic thrombocytopenic purpura, rheumatoid arthritis, interstitial nephritis, systemic lupus erythematosus, and psoriasis have been reported with therapy; use with caution in patients with autoimmune disorders.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease or a history of cardiovascular disease; hypotension, arrhythmia, tachycardia, cardiomyopathy, angina pectoris and MI have been observed with treatment. Patients with pre-existing cardiac abnormalities should have baseline ECGs prior to combination treatment with ribavirin; patients with a history of significant or unstable cardiac disease should not receive combination treatment with ribavirin.
- Diabetes: Diabetes mellitus and hyperglycemia have been reported; discontinue if diabetes cannot be effectively managed with medication. Use caution in patients with a history of diabetes mellitus, particularly if prone to DKA.

- Hepatic effects: Discontinue treatment immediately with hepatic decompensation (Child Pugh score >6). Patients with chronic hepatitis C (CHC) with cirrhosis and patients coinfected with human immunodeficiency virus (HIV) receiving highly-active antiretroviral therapy (HAART) are at increased risk for hepatic decompensation; monitor closely. A transient increase in ALT (2-5 times above baseline) which is not associated with liver dysfunction may occur with peginterferon alfa-2b use; may continue treatment with close monitoring.

- Infectious disorders: **[U.S. Boxed Warning]: May cause or aggravate infectious disorders; monitor closely; discontinue treatment in patients with worsening or persistently severe signs/symptoms of infectious disorders.** Interferon therapy is commonly associated with flu-like symptoms, including fever; rule out other causes/infection with persistent or high fever.

- Ischemic disorders: **[U.S. Boxed Warning]: May cause or aggravate ischemic disorders and hemorrhagic cerebrovascular events; monitor closely; discontinue treatment in patients with worsening or persistent ischemia** (including radiographic changes or worsening hepatic function). Has been reported in patients without risk factors for stroke.

- Renal impairment: Use with caution in patients with renal impairment (Cl_{cr} <50 mL/minute); monitor closely; dosage adjustments are recommended with monotherapy in patients with moderate-to-severe impairment. Do not use combination therapy with ribavirin in adults with renal dysfunction (Cl_{cr} <50 mL/minute); discontinue if serum creatinine >2 mg/dL in children. Serum creatinine increases have been reported in patients with renal insufficiency.

- Thyroid disorders: Use with caution in patients with thyroid disorders; may cause or aggravate hyper- or hypothyroidism. Discontinue use in patients with thyroid disease who cannot be controlled with medication.

Concurrent drug therapy issues:

- Combination therapy with ribavirin: **[U.S. Boxed Warning]: Combination treatment with ribavirin may cause birth defects and/or fetal mortality; hemolytic anemia (which may worsen cardiac disease), genotoxicity, mutagenicity, and may possibly be carcinogenic.**

Special populations:

- Elderly: Use with caution in the elderly; the potential adverse effects may be more pronounced in the elderly.

- Pediatrics: Growth velocity (height and weight) was decreased in children on combination treatment, particularly during the first 6 months of treatment. Safety and efficacy have not been established in children <3 years of age.

- Pregnancy: **[U.S. Boxed Warning]: Combination therapy with ribavirin may cause birth defects; avoid pregnancy in females and female partners of male patients.** Combination therapy with ribavirin is contraindicated in pregnancy.

Dosage form specific issues:

- Product variability: **Due to differences in dosage, patients should not change brands of interferon.**

Other warnings/precautions:

- Appropriate use: Combination therapy with ribavirin is preferred over monotherapy for the treatment of chronic hepatitis C. Safety and efficacy have not been established in patients who have failed other alfa interferon therapy, received organ transplants, coinfected with HIV or hepatitis B, or received treatment for >1 year.

Geriatric Considerations May require dosage reduction based upon renal dysfunction, but no established guidelines are available. Geriatric patients often have Cl_{cr} <50 mL/minute, as well as, many diseases that put them at risk for adverse effects with this agent. Calculation and measuring creatinine clearance must be done prior to initiating this drug.

Pregnancy Risk Factor C / X in combination with ribavirin

Pregnancy Considerations Reproduction studies with pegylated interferon alfa have not been conducted. Animal studies with nonpegylated interferon alfa-2b have demonstrated abortifacient effects. Disruption of the normal menstrual cycle was also observed in animal studies; therefore, the manufacturer recommends that reliable contraception is used in women of childbearing potential. Alfa interferon is endogenous to normal amniotic fluid. *In vitro* administration studies have reported that when administered to the mother, it does not cross the placenta. Case reports of use in pregnant women are limited. The Perinatal HIV Guidelines Working Group does not recommend that peginterferon-alfa be used during pregnancy. Peginterferon alfa-2b monotherapy should only be used in pregnancy when the potential benefit to the mother justifies the possible risk to the fetus. **[U.S. Boxed Warning]: Combination therapy with ribavirin may cause birth defects; avoid pregnancy in females and female partners of male patients;** combination therapy with ribavirin is contraindicated in pregnancy. A pregnancy registry has been established for women inadvertently exposed to ribavirin while pregnant (800-593-2214).

Lactation Excretion in breast milk unknown/not recommended

Breast-Feeding Considerations Breast milk samples obtained from a lactating mother prior to and after administration of interferon alfa-2b showed that interferon alfa is present in breast milk and administration of the medication did not significantly affect endogenous levels. The AAP considers interferon alfa to be “usually compatible with breast-feeding.” Breast-feeding is not linked to the spread of hepatitis C virus; however, if nipples are cracked or bleeding, breast-feeding is not recommended. Mothers coinfected with HIV are discouraged from breast-feeding to decrease potential transmission of HIV.

Adverse Reactions **Note:** Percentages reported for adults receiving monotherapy unless noted:

>10%:

Central nervous system: Headache (56%), fatigue (52%), depression (16% to 29%; may be severe), anxiety/emotional liability/irritability (28%), insomnia (23%), fever (22%), dizziness (12%)

Dermatologic: Alopecia (22%), pruritus (12%), dry skin (11%)

Gastrointestinal: Nausea (26%), anorexia (20%), diarrhea (18%), abdominal pain (8% to 15%), weight loss (11%)

Hematologic: Neutropenia (6% to 70%; grade 4: 1%), thrombocytopenia (7% to 20%; grades 3/4: <4%), anemia (in combination with ribavirin: 12% to 47%)

Local: Injection site inflammation/reaction (23% to 47%)

Neuromuscular & skeletal: Myalgia (54%), weakness (52%), musculoskeletal pain (28%), arthralgia (23%), rigors (23%)

Miscellaneous: Viral infection (11%)

>1% to 10%:

Cardiovascular: Chest pain (6%), flushing (6%)

Central nervous system: Concentration impaired (10%), malaise (7%), nervousness (4%), agitation (2%), suicidal behavior (ideation/attempt/suicide ≤2%)

Dermatologic: Rash (6%)

Endocrine & metabolic: Hypothyroidism (5%), menstrual disorder (4%), hyperthyroidism (3%)

Gastrointestinal: Vomiting (7%), dyspepsia (6%), xerostomia (6%), constipation (1%)

Hepatic: Transaminases increased (10%; transient), hepatomegaly (6%)

Local: Injection site pain (2% to 3%)

Ocular: Conjunctivitis (4%), blurred vision (2%)

Respiratory: Pharyngitis (10%), cough (8%), sinusitis (7%), dyspnea (4%), rhinitis (2%)

Miscellaneous: Diaphoresis (6%), neutralizing antibodies (2%)

≤1%, postmarketing, and/or case reports (limited to important or life-threatening): Abscess, addiction (drug) relapse, aggressive behavior, anaphylaxis, angina, angioedema, aphthous stomatitis, aplastic anemia, arrhythmia, autoimmune thrombocytopenia (with or without purpura), bronchiolitis obliterans, bronchoconstriction, cardiomyopathy, cellulitis, cerebral hemorrhage, cerebral ischemia, cotton wool spots, cytopenia, diabetes mellitus, drug overdose, emphysema, encephalopathy, erythema multiforme, fungal infection, gastroenteritis, gout, hallucinations, hearing impairment/loss, hemorrhagic colitis, homicidal ideation, hyperglycemia, hypersensitivity reactions, hypertriglyceridemia, hypotension, injection site necrosis, interstitial nephritis, interstitial pneumonia, ischemic colitis, leukopenia, loss of consciousness, lupus-like syndrome, macular edema, memory loss, MI, migraine, myositis, nerve palsy (facial/oculomotor), optic neuritis, pancreatitis, papilledema, pericardial effusion, peripheral neuropathy, phototoxicity, pleural effusion, pneumonia, pneumonitis, polyneuropathy, psoriasis, psychosis, pulmonary infiltrates, pure red cell aplasia, renal insufficiency, renal failure, retinal artery or vein thrombosis, retinal hemorrhage, retinal ischemia, rhabdomyolysis, rheumatoid arthritis, sarcoidosis, seizure, sepsis, serum creatinine increased, Stevens-Johnson syndrome, supraventricular arrhythmia, tachycardia, thrombotic thrombocytopenic purpura, thyroiditis, toxic epidermal necrolysis, transient ischemic attack, ulcerative colitis, urticaria, vasculitis, vertigo, vision decrease/loss, visual acuity decreased

Oncology: Emetic PotentialVery low (<10%)
Metabolism/Transport Effects**Inhibits** CYP1A2 (weak)
Drug Interactions

Aldesleukin: Interferons (Alfa) may enhance the adverse/toxic effect of Aldesleukin. In particular, risks of myocardial and renal toxicity may be increased by this combination. *Risk D: Consider therapy modification*

Ribavirin: Interferons (Alfa) may enhance the adverse/toxic effect of Ribavirin. Hemolytic anemia has been observed. *Risk C: Monitor therapy*

Theophylline Derivatives: Interferons may decrease the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Zidovudine: Interferons may enhance the adverse/toxic effect of Zidovudine. Interferons may decrease the metabolism of Zidovudine. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid use in patients with hepatitis C virus.
Monitoring ParametersBaseline and periodic TSH, hematology (including CBC with differential, platelets), chemistry (including LFTs) testing, renal function, triglycerides. Evaluate for depression and other psychiatric symptoms before and after initiation of therapy; baseline ophthalmic eye examination; periodic ophthalmic exam in patients with diabetic or hypertensive retinopathy; baseline echocardiogram in patients with cardiac disease; serum HCV RNA levels, serum glucose or Hb A_{1c} (for patients with diabetes mellitus).

In combination therapy with ribavirin, pregnancy tests (for women of childbearing age who are receiving treatment or who have male partners who are receiving treatment), continue monthly up to 6 months after discontinuation of therapy.

Reference Range

Early viral response (EVR): >2 log decrease in HCV RNA after 12 weeks of treatment

End of treatment response (ETR): Absence of detectable HCV RNA at end of the recommended treatment period

Sustained treatment response (STR): Absence of HCV RNA in the serum 6 months following completion of full treatment course

Monitoring: Lab TestsBaseline and periodic TSH, hematology (including CBC with differential, platelets). chemistry (including LFTs) testing, renal function, triglycerides; serum HCV RNA levels, serum glucose or Hb A_{1c} (for patients with diabetes mellitus)

In combination therapy with ribavirin, pregnancy tests (for women of childbearing age who are receiving treatment or who have male partners who are receiving treatment), continue monthly up to 6 months after discontinuation of therapy.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [preservative free]:

PegIntron™: 50 mcg, 80 mcg, 120 mcg, 150 mcg [contains polysorbate 80 and sucrose]

PegIntron™ Redipen®: 50 mcg, 80 mcg, 120 mcg, 150 mcg [contains polysorbate 80 and sucrose]

Generic AvailableNo
ManufacturerSchering-Plough
Pricing: U.S. (www.drugstore.com)

Kit (Peg-Intron Redipen Pak 4)

50 mcg/0.5 mL (4): $1747.09

Mechanism of ActionAlpha interferons are a family of proteins, produced by nucleated cells, that have antiviral, antiproliferative, and immune-regulating activity. There are 16 known subtypes of alpha interferons. Interferons interact with cells through high affinity cell surface receptors. Following activation, multiple effects can be detected including induction of gene transcription. Inhibits cellular growth, alters the state of cellular differentiation, interferes with oncogene expression, alters cell surface antigen expression, increases phagocytic activity of macrophages, and augments cytotoxicity of lymphocytes for target cells.
Pharmacodynamics/Kinetics

Bioavailability: Increases with chronic dosing

Half-life elimination: ~40 hours (range: 22-60 hours)

Time to peak: 15-44 hours

Excretion: Urine (30%)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusSevere psychiatric adverse effects (including depression, suicidal ideation, and suicide attempt) may occur. May also cause sedation, anxiety, emotional lability, irritability, insomnia, dizziness, and impaired concentration.
Mental Health: Effects on Psychiatric TreatmentContraindicated in those with severe psychiatric disorder. Gastrointestinal side effects are common; use caution with SSRIs, valproic acid, and lithium. Flu-like symptoms are common; take this into consideration if also concerned about SSRI discontinuation syndrome. A case of agranulocytosis has been reported with concurrent use of clozapine; monitor.
Index TermsInterferon Alfa-2b (PEG Conjugate); Pegylated Interferon Alfa-2b

Pegvisomant: Increased Risks of Hepatotoxicity - June 2008

Pfizer Canada, in conjunction with Health Canada, has issued a “Dear Healthcare Professional” letter regarding upcoming labeling changes for pegvisomant (Somavert®) concerning an increased risk of markedly elevated hepatic enzymes associated with its use in combination with a somatostatin analogue (octreotide acetate).

Elevated hepatic transaminase levels >10 times the upper limit of normal (ULN) have been reported in two postmarketing studies of patients receiving pegvisomant concomitantly with octreotide, and in some patients the changes were observed within 3 months of initiating therapy. Some of the affected patients had been receiving supratherapeutic doses of octreotide. In one of the studies, enzyme levels returned to normal upon discontinuation of therapy.

It is recommended that prior to initiating pegvisomant therapy, baseline levels of transaminases, total bilirubin (TBIL), and alkaline phosphatase be obtained and then routinely monitored during therapy. A comprehensive hepatic workup is recommended for any patient with elevated hepatic enzymes ≥3 times ULN during therapy. Therapy should be discontinued immediately if at any time a patient displays signs/symptoms of hepatitis or other hepatic injury (eg, jaundice, bilirubinuria). Discontinue therapy permanently if hepatic injury is confirmed.

Patients with enzyme levels ≥3 but <5 times ULN and without signs/symptoms of hepatic injury or an increase in serum TBIL may continue with therapy, but with more frequent (weekly) monitoring of hepatic function.

Patients with transaminase levels ≥5 times ULN or transaminase levels ≥3 times ULN associated with any increase in TBIL (with or without signs/symptoms of hepatitis or other hepatic injury) should discontinue pegvisomant therapy immediately. Cautious reinitiation of therapy with more frequent monitoring of hepatic function may be considered with normalization of hepatic enzymes and function.

Further information may be found at http://www.hc-sc.gc.ca/dhp-mps/medeff/advisories-avis/public/_2008/index-eng.php

Pronunciation(peg VI soe mant)

U.S. Brand NamesSomavert®

Canadian Brand NamesSomavert®

Pharmacologic CategoryGrowth Hormone Receptor Antagonist

Use: Labeled IndicationsTreatment of acromegaly in patients resistant to or unable to tolerate other therapies

Dosing: Adults**Acromegaly:** SubQ: Initial loading dose: 40 mg; maintenance dose: 10 mg once daily; doses may be adjusted by 5 mg increments in 4- to 6-week intervals based on IGF-I concentrations (maximum maintenance dose: 30 mg/day)

Dosing: ElderlyRefer to adult dosing.

Dosing: Hepatic Impairment

At initiation of therapy:

Normal liver function test (LFT): Initiate therapy; monitor LFT monthly for first 6 months, quarterly for next 6 months, then biannually the following year.

Baseline LFT elevated but ≤3 x ULN: May initiate therapy with monthly evaluation of LFT for 1 year then biannually the following year.

Baseline LFT >3 times ULN: Do not initiate treatment without comprehensive work-up to determine cause; monitor closely if treatment is started.

With ongoing therapy:

LFT ≥3 x but <5 x ULN without signs/symptoms of hepatitis, hepatic injury, or increase in total bilirubin: Continue treatment, but monitor LFT weekly for further increases; perform comprehensive hepatic work-up to rule out alternative cause of hepatic dysfunction

LFT ≥5 x ULN or transaminase ≥3 x ULN associated with any increase in total bilirubin: Discontinue immediately and perform comprehensive hepatic work-up. If LFTs return to normal, may cautiously consider restarting therapy with frequent LFT monitoring.

Signs or symptoms of hepatitis or hepatic injury: Discontinue therapy immediately and perform comprehensive hepatic work-up; discontinue permanently if liver injury is confirmed.

Administration: OtherFor SubQ administration only; to minimize the risk for lipohypertrophy, rotate injection site daily; may administer in upper arm, thigh, abdomen, or buttocks; do not rub injection site. The manufacturer recommends the initial dose be administered under the supervision of prescribing healthcare provider.

StorageStore intact vials under refrigeration at 2°C to 8°C (36°F to 46°F); protect from freezing. Following reconstitution, use within 6 hours. Do not use solution if cloudy.

ReconstitutionReconstitute each vial with 1 mL SWFI. Aim diluent along glass wall of vial. Gently roll in order to dissolve powder; do not shake.

ContraindicationsHypersensitivity to pegvisomant, polyethylene glycol, latex, or any other component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Growth hormone (GH) deficiency: Use may be associated with functional GH deficiency in spite of elevated serum GH levels; monitor closely for signs/symptoms of GH deficiency (eg, decreased muscle or bone mass, decreased strength); dose adjustments may be needed to maintain insulin-like growth factor 1 (IGF-1) within age-adjusted normal levels.

- Hepatic effects: May increase liver function tests; transient but marked elevations (≤15 x upper limit of normal [ULN]) in transaminase levels, usually without accompanying hyperbilirubinemia, have been reported with use; transaminase levels often normalized following interruption of therapy; use with caution in patients with hepatic impairment; monitor hepatic function periodically during therapy; discontinue use immediately with signs/symptoms of jaundice.

- Lipohypertrophy: May occur following administration; daily rotation of injection site may prevent or reduce incidence.

Disease-related concerns:

- Diabetes: Use with caution in patients with diabetes mellitus; may affect glucose metabolism; monitor closely; dosage adjustments of antidiabetic therapy may be necessary.

- Growth hormone (GH)-secreting tumors: Pegvisomant may expand GH-secreting tumors causing serious complications; carefully monitor patients with periodic imaging scans of the sella turcica.

- Renal impairment: Use in patients with renal impairment has not been studied.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific:

- Latex: Vial stopper contains latex

Other warnings/precautions:

- Administration: The manufacturer recommends the initial dose be administered under the supervision of prescribing healthcare provider.

- Monitoring: Interferes with commercially available GH assays; do not make dose adjustments based on serum GH concentrations reported from assays; use insulin-like growth factor I (IGF-I) levels to adjust therapy.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women; use during pregnancy only if clearly needed.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Central nervous system: Pain (4% to 14%)

Gastrointestinal: Diarrhea (≤14%), nausea (≤14%)

Hepatic: Liver function tests abnormal (4% to 12%; >10 x ULN: 1%)

Local: Injection site reaction (4% to 11%)

Miscellaneous: Infection (≤23%), non-neutralizing anti-GH antibodies (17%; relevance unknown), flu-like syndrome (4% to 12%)

1% to 10%:

Cardiovascular: Hypertension (≤8%), chest pain (≤8%), peripheral edema (≤8%)

Central nervous system: Dizziness (4% to 8%)

Neuromuscular & skeletal: Back pain (≤8%), paresthesia (≤7%)

Respiratory: Sinusitis (≤8%)

Postmarketing and/or case reports: Alkaline phosphatase increased, hepatic transaminases increased ≤15 times ULN, lipohypertrophy, progressive tumor growth

Drug Interactions

Analgesics (Opioid): May diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Antidiabetic Agents: Pegvisomant may enhance the hypoglycemic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Somatostatin Analogs: May enhance the adverse/toxic effect of Pegvisomant. Specifically, this combination may increase the risk for significant elevations of liver enzymes. *Risk C: Monitor therapy*

Test InteractionsInterferes with measurement of serum GH concentrations by available GH assays; commercially available GH assays will overestimate true GH levels

Monitoring ParametersGH-secreting tumor size, serum glucose, signs and symptoms of growth hormone deficiency, serum IGF-I (every 4-6 weeks after initial dose and dosage change, every 6 months when normalized)

Liver function tests (ALT, AST, total bilirubin, and alkaline phosphatase levels):

- Baseline:
  - Normal: Monthly for first 6 months, quarterly for next 6 months, biannually for the next year
  - Elevated, but ≤3 x ULN: Monitor monthly for at least 1 year, then biannually the next year
  - >3 x ULN: Withhold treatment; perform comprehensive liver function evaluation (rule out cholelithiasis or choledocholithiasis); if appropriate for treatment, closely monitor hepatic function and clinical status.
- During therapy:
  - ≥3 x but <5 x ULN without signs/symptoms of hepatitis, hepatic injury or increase in total bilirubin: monitor weekly for further increases; perform comprehensive hepatic work-up
  - ≥5 x ULN or transaminase ≥3 x ULN associated with any increase in total bilirubin: Comprehensive hepatic work-up. If appropriate for treatment monitor closely

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, and herbal products patient may be taking. Closely assess results of all laboratory tests at beginning and periodically during therapy. **Note:** First dose should be administered under supervision of prescriber. Assess therapeutic effectiveness and adverse reactions. Teach patient proper use (storage, reconstitution, injection technique, site rotation, and disposal of syringes/needles), possible side effects/appropriate interventions, and adverse symptoms to report. Instruct patients with diabetes on need to monitor glucose levels regularly; dose adjustment of hypoglycemic agent may be needed.

Monitoring: Lab TestsSerum glucose, serum IGF-I (every 4-6 weeks after initial dose and dosage change, every 6 months when normalized)

Liver function tests (ALT, AST, total bilirubin, and alkaline phosphatase levels):

- Baseline:
  - Normal: Monthly for first 6 months, quarterly for next 6 months, biannually for the next year
  - Elevated, but ≤3 x ULN: Monitor monthly for at least 1 year, then biannually the next year
  - >3 x ULN: Withhold treatment; perform comprehensive liver function evaluation (rule out cholelithiasis or choledocholithiasis); if appropriate for treatment, closely monitor hepatic function and clinical status.
- During therapy:
  - ≥3 x but <5 x ULN without signs/symptoms of hepatitis, hepatic injury or increase in total bilirubin: monitor weekly for further increases; perform comprehensive hepatic work-up
  - ≥5 x ULN or transaminase ≥3 x ULN associated with any increase in total bilirubin: Comprehensive hepatic work-up. If appropriate for treatment monitor closely

Patient EducationInform prescriber of all prescriptions, OTC medications, or herbal products you are taking, and any allergies you have. This medication may only be administered by injection. If instructed in self-injection, follow instructions exactly. Report immediately any reaction at injection site (redness, swelling, itching). May cause diarrhea (buttermilk, boiled milk, or yogurt may help); nausea (frequent small meals and good mouth care may help); or signs of allergic response (chest pain, respiratory difficulty, skin rash). **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [preservative free]:

- Somavert®: 10 mg, 15 mg, 20 mg [vial stopper contains latex; packaged with SWFI]

Generic AvailableNo

ManufacturerPharmacia

Mechanism of ActionAn analogue of human growth hormone, pegvisomant selectively binds to growth hormone (GH) receptors, blocking the binding of endogenous GH, leading to decreased serum concentrations of insulin-like growth factor-1 (IGF-I) and other GH-responsive proteins. Pegvisomant is made up of a recombinant DNA protein covalently bound to polyethylene glycol (PEG) polymers.

Pharmacodynamics/Kinetics

Absorption: SubQ: 57%

Distribution: 7 L

Half-life elimination: ~6 days

Time to peak, serum: 33-77 hours

Excretion: Urine (<1%)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentGI side effects are common; use caution with SSRIs. Increased dose of pegvisomant may be needed in patients receiving opioids.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(pem e TREKS ed)

U.S. Brand NamesAlimta®

Canadian Brand NamesAlimta®

Pharmacologic CategoryAntineoplastic Agent, Antimetabolite; Antineoplastic Agent, Antimetabolite (Antifolate)

Use: Labeled IndicationsTreatment of malignant pleural mesothelioma; treatment of locally advanced or metastatic nonsquamous nonsmall cell lung cancer (NSCLC)

Use: Unlabeled/InvestigationalTreatment of bladder cancer

Dosing: AdultsDetails concerning dosing in combination regimens should also be consulted. **Note:** Start vitamin supplements 1 week before initial dose of pemetrexed: Folic acid 350-1000 mcg/day orally (must be taken at least 5 out of 7 days prior to treatment initiation; continue for 21 days after last pemetrexed dose) and vitamin B_{12} 1000 mcg I.M. during the week prior to treatment initiation and then every 3 cycles. Give dexamethasone 4 mg orally twice daily for 3 days, beginning the day before treatment to minimize cutaneous reactions. New treatment cycles should not begin unless ANC ≥1500/mm^3, platelets ≥100,000/mm^3, and Cl_{cr} ≥45 mL/minute.

Nonsmall cell lung cancer: I.V: 500 mg/m^2 on day 1 of each 21-day cycle (in combination with cisplatin for initial treatment; monotherapy in patients who have received prior treatment)

Malignant pleural mesothelioma: I.V.: 500 mg/m^2 on day 1 of each 21-day cycle (in combination with cisplatin)

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} ≥45 mL/minute: No dosage adjustment required.

Cl_{cr} <45 mL/minute: No dosage adjustment guidelines are available; manufacturer recommends not using the drug.

Dosing: Hepatic ImpairmentGrade 4 transaminase elevation (>20 times ULN): Reduce dose to 75% of previous dose

Dosing: Adjustment for Toxicity

Toxicity: Discontinue if patient develops grade 3 or 4 toxicity after two dose reductions (except grade 3 transaminase elevations) or immediately if grade 3 or 4 neurotoxicity develops

Hematologic toxicity: Upon recovery, reinitiate therapy

Nadir ANC <500/mm^3 and nadir platelets ≥50,000/mm^3: Reduce dose to 75% of previous dose of pemetrexed (and cisplatin)

Nadir platelets <50,000/mm^3**without bleeding** (regardless of nadir ANC): Reduce dose to 75% of previous dose of pemetrexed (and cisplatin)

Nadir platelets <50,000/mm^3**with bleeding** (regardless of nadir ANC): Reduce dose to 50% of previous dose of pemetrexed (and cisplatin)

Nonhematologic toxicity (excluding neurotoxicity or grade 3 transaminase elevations): Withhold treatment until recovery to baseline; upon recovery, reinitiate therapy as follows:

Grade 3 or 4 toxicity (excluding mucositis or grade 3 transaminase elevations): Reduce dose to 75% of previous dose of pemetrexed (and cisplatin)

Grade 3 or 4 diarrhea or any diarrhea requiring hospitalization: Reduce dose to 75% of previous dose of pemetrexed (and cisplatin)

Grade 3 or 4 mucositis: Reduce pemetrexed dose to 50% of previous dose (continue cisplatin at 100% of previous dose)

Neurotoxicity:

Common Toxicity Criteria (CTC) Grade 0-1: Continue at 100% of previous dose of pemetrexed (and cisplatin)

CTC Grade 2: Continue pemetrexed at previous dose; reduce cisplatin dose to 50% of previous dose

Dosing: Combination Regimens

Bladder cancer: Pemetrexed (Bladder Cancer Regimen)

Lung cancer (nonsmall cell): Pemetrexed-Cisplatin (NSCLC)

Malignant pleural mesothelioma:

Cisplatin-Pemetrexed (Mesothelioma)

Pemetrexed-Carboplatin

Calculations

- ANC: Absolute Neutrophil Count
- Body Surface Area: Adults
- Creatinine Clearance: Adults

Administration: I.V.Infuse over 10 minutes.

Administration: I.V. DetailpH: 6.6-7.8

Dietary ConsiderationsInitiate folic acid supplementation 1 week before first dose of pemetrexed, continue for full course of therapy, and for 21 days after last dose. Institute vitamin B_{12} 1 week before the first dose; administer every 9 weeks thereafter.

StorageStore intact vials at room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Reconstituted and infusion solutions are stable for 24 hours when refrigerated at 2°C to 8°C (36°F to 46°F) or stored at room temperature of 15°C to 30°C (59°F to 86°F). Concentrations at 25 mg/mL are stable in polypropylene syringes for 2 days at room temperature (23°C) (Zhang, 2005).

ReconstitutionReconstitute with NS (preservative free); add 4.2 mL to the 100 mg vial and 20 mL to the 500 mg vial, resulting in a 25 mg/mL concentration. Gently swirl. Solution may be colorless to green-yellow. Further dilute in 100 mL NS for infusion. Use appropriate precautions for handling and disposal.

CompatibilityStable in NS; physically **incompatible** with calcium-containing products, including Ringer's and lactated Ringer's injection.

Y-site administration: Compatible: Acyclovir, amifostine, amikacin sulfate, aminophylline, ampicillin sodium, ampicillin sodium-sulbactam sodium, aztreonam, bumetanide, buprenorphine hydrochloride, butorphanol tartrate, carboplatin, ceftizoxime sodium, ceftriaxone sodium, cefuroxime sodium, cimetidine hydrochloride, cisplatin, clindamycin phosphate, co-trimoxazole, cyclophosphamide, cytarabine, dexamethasone sodium phosphate, dexrazoxane, diphenhydramine hydrochloride, docetaxel, dopamine hydrochloride, enalaprilat, famotidine, fluconazole, fluorouracil, ganciclovir sodium, granisetron hydrochloride, haloperidol lactate, heparin sodium, hydromorphone hydrochloride, hydroxyzine hydrochloride, ifosfamide, leucovorin calcium, lorazepam, mannitol, meperidine hydrochloride, mesna, methylprednisolone sodium succinate, metoclopramide hydrochloride, morphine sulfate, paclitaxel, potassium chloride, promethazine hydrochloride, ranitidine hydrochloride, sodium bicarbonate, ticarcillin disodium, ticarcillin disodium-clavulanate potassium, vancomycin hydrochloride, vinblastine sulfate, vincristine sulfate, zidovudine. **Incompatible:** Amphotericin B, calcium gluconate, cefazolin sodium, cefotaxime sodium, cefotetan disodium, cefoxitin sodium, ceftazidime, chlorpromazine hydrochloride, ciprofloxacin, dobutamine hydrochloride, doxorubicin hydrochloride, doxycycline hyclate, droperidol, gemcitabine hydrochloride, gentamicin sulfate, irinotecan hydrochloride, metronidazole, minocycline hydrochloride, mitoxantrone hydrochloride, nalbuphine hydrochloride, ondansetron hydrochloride, prochlorperazine edisylate, tobramycin sulfate, topotecan hydrochloride.

ContraindicationsSevere hypersensitivity to pemetrexed or any component of the formulation

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: Use may cause anemia, neutropenia, thrombocytopenia and/or pancytopenia; may require dose reductions in subsequent cycles. Prophylactic folic acid and vitamin B_{12} supplements are necessary to reduce hematologic toxicity and should be started 1 week before the first dose of pemetrexed.

- Cutaneous reactions: May occur; pretreatment with corticosteroids reduces the incidence and severity of cutaneous reactions.

- Gastrointestinal toxicity: May occur; prophylactic folic acid and vitamin B_{12} supplements are necessary to reduce gastrointestinal toxicity and should be started 1 week before the first dose of pemetrexed.

Disease-related concerns:

- Ascites/pleural effusions: Effects of third space fluid on drug disposition unknown; consider draining effusion(s) prior to treatment.

- Hepatic impairment: Use caution with hepatic impairment not due to metastases; may require dose adjustment.

- Renal impairment: Decreased renal function results in increased toxicity. The manufacturer does not recommend use if Cl_{cr} <45 mL/minute. Use caution in patients receiving concurrent nephrotoxins; may result in delayed pemetrexed clearance.

Concurrent drug therapy issues:

- NSAIDs: NSAIDs may reduce the clearance of pemetrexed. Patients with Cl_{cr} 45-79 mL/minute should avoid NSAIDs with short elimination half-lives (eg, ibuprofen, indomethacin, ketoprofen, ketorolac) for 2 days before, the day of, and 2 days following a dose of pemetrexed. All patients should avoid NSAIDs with long half-lives (eg, nabumetone, naproxen, oxaprozin, piroxicam) for 5 days before, the day of, and 2 days following a dose of pemetrexed.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorD

Pregnancy ConsiderationsAdverse events were observed in animal reproduction studies. There are no adequate and well-controlled trials in pregnant women. Women of childbearing potential should avoid becoming pregnant during treatment.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding is not recommended.
Adverse Reactions**Note:** Reported for monotherapy in patients who received folate and B_{12} supplementation.

>10%:

Central nervous system: Fatigue (34%; dose-limiting)

Dermatologic: Rash/desquamation (14%)

Gastrointestinal: Nausea (31%), anorexia (22%), vomiting (16%), stomatitis (15%), diarrhea (13%)

Hematologic: Anemia (19%; grades 3/4: 4%), leukopenia (12%; grades 3/4: 4%), neutropenia (11%; grades 3/4: 5%; nadir: 8-10 days; recovery: 12-17 days; dose-limiting)

Respiratory: Pharyngitis (15%)

1% to 10%:

Cardiovascular: Edema (5%)

Central nervous system: Fever (8%)

Dermatologic: Pruritus (7%), alopecia (6%), erythema multiforme

Gastrointestinal: Constipation (6%), weight loss (1%), abdominal pain

Hematologic: Thrombocytopenia (8%; grades 3/4: 2%; dose-limiting), febrile neutropenia (grades 3/4: 2%)

Hepatic: ALT increased (8%; grades 3/4: 2%), AST increased (7%; grades 3/4: 1%)

Neuromuscular & skeletal: Neuropathy (sensory and motor)

Renal: Creatinine increased

Miscellaneous: Allergic reaction/hypersensitivity, infection

<1%, postmarketing, and/or case reports (mono- or combination therapy): Colitis, interstitial pneumonitis, pancytopenia, radiation recall (median onset: 6 days; range: 1-35 days), renal failure, supraventricular arrhythmia

Oncology: VesicantNo
Oncology: Emetic PotentialLow (10% to 30%)
Drug Interactions

NSAID (Nonselective): May decrease the excretion of Pemetrexed. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsLower ANC nadirs occur in patients with elevated baseline cystathionine or homocysteine concentrations. Levels of these substances can be reduced by folic acid and vitamin B_{12} supplementation.
Monitoring ParametersCBC with differential and platelets (before each dose); serum creatinine, total bilirubin, ALT, AST (day 1 of each, or every other, cycle)
Nursing: Physical Assessment/MonitoringSee premedication requirements (eg, start folic acid and vitamin B_{12} one week before first dose of pemetrexed). Corticosteroids may be used to reduce cutaneous reactions. Assess potential for interactions with other pharmacological agents (eg, NSAIDs and other agents with nephrotoxic potential). Evaluate results of laboratory tests on a regular schedule and assess adverse response at frequent intervals during treatment (eg, chest pain, hypertension, CNS changes, GI upset [nausea, vomiting, diarrhea, constipation], anemia, neuropathy, rash, infection). Teach patient appropriate interventions to reduce side effects and adverse symptoms to report.
Monitoring: Lab TestsCBC with differential and platelets (before each dose); serum creatinine, total bilirubin, ALT, AST (day 1 of each, or every other, cycle)
Patient EducationThis medication is only administered intravenously. Report immediately any burning, pain, itching, or redness at infusion site or any sudden feelings of anxiety, difficulty breathing, chest or back pain. It is important that you maintain adequate hydration (2-3 L/day of fluids, unless instructed to restrict fluid intake) and adequate nutrition (frequent small meals may help). Maintain regularly scheduled dietary supplements (vitamin B_{12} and folic acid) as prescribed. May cause severe nausea, vomiting, constipation or diarrhea (small frequent meals, and good mouth care are important; if persistent, consult prescriber for medication); mouth sores (use soft toothbrush or cotton swabs for mouth care). Report promptly any chest pain, swelling of extremities or unusual weight gain; rash; tingling or loss of sensation in extremities; difficulty breathing; fever, chills; unusual or persistent fatigue, or any other unusual symptoms. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant during therapy. Consult prescriber for instruction on appropriate contraceptive measures. This drug may cause severe fetal defects. Do not breast-feed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Alimta®: 100 mg, 500 mg

Generic AvailableNo
ManufacturerLilly
Pricing: U.S. (www.drugstore.com)

Solution (reconstituted) (Alimta)

500 mg (1): $2644.11

Mechanism of ActionInhibits thymidylate synthase (TS), dihydrofolate reductase (DHFR), glycinamide ribonucleotide formyltransferase (GARFT), and aminoimidazole carboxamide ribonucleotide formyltransferase (AICARFT), the enzymes involved in folate metabolism and DNA synthesis, resulting in inhibition of purine and thymidine nucleotide and protein synthesis.

Pharmacodynamics/Kinetics

Duration: V_{dss}: 16.1 L

Protein binding: ~73% to 81%

Metabolism: Minimal

Half-life elimination: Normal renal function: 3.5 hours; Cl_{cr} 40-59 mL/minute: 5.3-5.8 hours

Excretion: Urine (70% to 90% as unchanged drug)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Dysphagia, esophagitis, odynophagia, and stomatitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusFatigue and depression are common

Mental Health: Effects on Psychiatric TreatmentGastrointestinal side effects are common; these effects may be additive with concurrent use of SSRIs, acetylcholinesterase inhibitors, aripiprazole, or ziprasidone. Hematologic adverse effects are common; use caution with clozapine, carbamazepine, valproate, mirtazapine. Sedation is common; concurrent use with psychotropics may produce additive effects.

Pemirolast

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(pe MIR oh last)
U.S. Brand NamesAlamast®
Canadian Brand NamesAlamast®
Pharmacologic CategoryMast Cell Stabilizer; Ophthalmic Agent, Miscellaneous
Use: Labeled IndicationsPrevention of itching of the eye due to allergic conjunctivitis
Dosing: Adults**Allergic conjunctivitis:** Ophthalmic: 1-2 drops instilled in affected eye(s) 4 times/day
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricChildren >3 years: Refer to adult dosing.
StorageStore at room temperature of 15°C to 25°C (59°F to 77°F).
ContraindicationsHypersensitivity to pemirolast or any component of the formulation
Warnings/Precautions

Special populations:

- Contact lens wearers: Not for use to treat contact lens-related irritation. Do not wear soft contact lens if eyes are red. Contains benzalkonium chloride (a preservative in Alamast®) which may be absorbed by contact lenses; remove contact lens prior to administration and wait 10 minutes before reinserting.

- Pediatrics: Safety and efficacy have not been established in children <3 years of age.

Other warnings/precautions:

- Appropriate use: For ophthalmic use only; not for injection or oral use.

Pregnancy Risk FactorC
Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Should only be used during pregnancy if the benefit outweighs the risk to the fetus.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

>10%:

Central nervous system: Headache (10% to 25%)

Respiratory: Rhinitis (10% to 25%)

Miscellaneous: Cold/flu symptoms (10% to 25%)

<5%:

Central nervous system: Fever

Endocrine & metabolic: Dysmenorrhea

Neuromuscular & skeletal: Back pain

Ocular: Burning eyes, dry eyes, foreign body sensation, ocular discomfort

Respiratory: Bronchitis, cough, sinusitis, sneezing/nasal congestion

Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, ophthalmic, as potassium: 0.1% (10 mL) [contains lauralkonium chloride]

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Solution (Alamast)

0.1% (10): $97.52

Mechanism of ActionMast cell stabilizer that inhibits the *in vivo* type I immediate hypersensitivity reaction; in addition, inhibits chemotaxis of eosinophils into the ocular tissue and blocks their release of mediators; also reported to prevent calcium influx into mast cells following antigen stimulation
Pharmacodynamics/Kinetics

Onset of action: A few days

Peak effect: 4 weeks

Absorption: Systemic

Half-life elimination: 4.5 hours

Excretion: Urine (10% to 15%)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
International Brand NamesAlegysal (CL, ID, JP, PH, TW); Pemirox (HK, TH)

Medication Safety Issues

Sound-alike/look-alike issues:

Levatol® may be confused with Lipitor®

International issues:

Levatol® may be confused with Lovacol® which is a brand name for lovastatin in Chile, Finland, and France

Pronunciation(pen BYOO toe lole)
U.S. Brand NamesLevatol®
Canadian Brand NamesLevatol®
Pharmacologic CategoryBeta Blocker With Intrinsic Sympathomimetic Activity
Use: Labeled IndicationsTreatment of mild to moderate arterial hypertension
Dosing: Adults**Hypertension:** Oral: Initial: 20 mg once daily, full effect of a 20 or 40 mg dose is seen by the end of a 2-week period, doses of 40-80 mg have been tolerated but have shown little additional antihypertensive effects; usual dose range (JNC 7): 10-40 mg once daily
Dosing: ElderlyRefer to adult dosing.
ContraindicationsHypersensitivity to penbutolol or any component of the formulation; uncompensated congestive heart failure; cardiogenic shock; bradycardia or heart block (except in patients with a functioning artificial pacemaker); sinus node dysfunction; asthma; bronchospastic disease; COPD; pulmonary edema; pregnancy (2nd and 3rd trimester)
Allergy Considerations

- Beta-Blocker Allergy

Warnings/Precautions

Concerns related to adverse events:

- Anaphylactic reactions: Use caution with history of severe anaphylaxis to allergens; patients taking beta-blockers may become more sensitive to repeated challenges. Treatment of anaphylaxis (eg, epinephrine) in patients taking beta-blockers may be ineffective or promote undesirable effects.

Disease-related concerns:

- Bronchospastic disease: In general, patients with bronchospastic disease should not receive beta-blockers; if used at all, should be used cautiously with close monitoring.
- Conduction abnormality: Consider pre-existing conditions such as sick sinus syndrome before initiating.
- Diabetes: Use with caution in patients with diabetes mellitus; may potentiate hypoglycemia and/or mask signs and symptoms.
- Heart failure (HF): Use with caution in patients with compensated heart failure and monitor for a worsening of the condition (beta-blockers with intrinsic sympathomimetic activity have not been demonstrated to be of value in HF).
- Myasthenia gravis: Use with caution in patients with myasthenia gravis.
- Peripheral vascular disease (PVD): Use with caution in patients with PVD (including Raynaud's).
- Pheochromocytoma (untreated): Adequate alpha-blockade is required prior to use of any beta-blocker.
- Psychiatric disease: Use with caution in patients with a history of psychiatric illness; may cause or exacerbate CNS depression.

Concurrent drug therapy issues:

- Anesthetic agents: Use with caution in patients receiving anesthetic agents which decrease myocardial function.
- Calcium channel blockers: Use with caution in patients on concurrent verapamil or diltiazem; bradycardia or heart block can occur.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Abrupt withdrawal: Beta-blocker therapy should not be withdrawn abruptly (particularly in patients with CAD), but gradually tapered to avoid acute tachycardia, hypertension, and/or ischemia.

Geriatric ConsiderationsDue to alterations in the beta-adrenergic autonomic nervous system, beta-adrenergic blockade may result in less hemodynamic response than seen in younger adults. Studies indicate that despite decreased sensitivity to the chronotropic effects of beta-blockade with age, there appears to be an increased myocardial sensitivity to the negative inotropic effect during stress (ie, exercise). Controlled trials have shown the overall response rate for propranolol to be only 20% to 50% in elderly populations. Therefore, all beta-adrenergic blocking drugs may result in a decreased response as compared to younger adults.

Pregnancy Risk FactorC (manufacturer); D (2nd and 3rd trimester - expert analysis)

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsIt is recommended that the infant be monitored for signs or symptoms of beta-blockade (hypotension, bradycardia, etc) with long-term use.

Adverse Reactions

1% to 10%:

Cardiovascular: CHF, arrhythmia

Central nervous system: Mental depression, headache, dizziness, fatigue

Gastrointestinal: Nausea, diarrhea, dyspepsia

Neuromuscular & skeletal: Arthralgia

<1% (Limited to important or life-threatening): AV block, bradycardia, bronchospasm, cold extremities, confusion, cough, edema, hypoglycemia, hypotension, insomnia, lethargy, ischemic colitis, mesenteric arterial thrombosis, nightmares, purpura, Raynaud's phenomena, thrombocytopenia

Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Beta-Blockers may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Blockers: Beta-Blockers may enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. *Risk D: Consider therapy modification*

Alpha2-Agonists: Beta-Blockers may enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Aminoquinolines (Antimalarial): May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Amiodarone: May enhance the bradycardic effect of Beta-Blockers. Possibly to the point of cardiac arrest. Amiodarone may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Beta-Blockers. Beta-Blockers may decrease the metabolism of Antipsychotic Agents (Phenothiazines). Antipsychotic Agents (Phenothiazines) may decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Barbiturates: May decrease the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Beta2-Agonists: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Beta-Blockers. Bradycardia and signs of heart failure have also been reported. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Cardiac Glycosides: Beta-Blockers may enhance the bradycardic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dipyridamole: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Disopyramide: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Insulin: Beta-Blockers may enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Lidocaine: Beta-Blockers may decrease the metabolism of Lidocaine. *Risk C: Monitor therapy*

Methacholine: Beta-Blockers may enhance the adverse/toxic effect of Methacholine. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Beta-Blockers may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Propafenone: May decrease the metabolism of Beta-Blockers. Propafenone possesses some independent beta blocking activity. *Risk C: Monitor therapy*

Propoxyphene: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Reserpine: May enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Beta-Blockers. **Exceptions:** Rifabutin. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Theophylline Derivatives: Beta-Blockers (Nonselective) may diminish the bronchodilatory effect of Theophylline Derivatives. *Risk D: Consider therapy modification*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as sulfate: 20 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (Levatol)

20 mg (30): $67.03

Mechanism of ActionBlocks both beta$_1$- and beta$_2$-receptors and has mild intrinsic sympathomimetic activity; has negative inotropic and chronotropic effects and can significantly slow AV nodal conduction

Pharmacodynamics/Kinetics

Absorption: ~100%

Protein binding: 80% to 98%

Metabolism: Extensively hepatic (oxidation and conjugation)

Bioavailability: ~100%

Half-life elimination: 5 hours

Excretion: Urine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation). Penbutolol is a nonselective beta-blocker and may enhance the pressor response to epinephrine, resulting in hypertension and bradycardia. Many nonsteroidal anti-inflammatory drugs, such as ibuprofen and indomethacin, can reduce the hypotensive effect of beta-blockers after 3 or more weeks of therapy with the NSAID. Short-term NSAID use (ie, 3 days) requires no special precautions in patients taking beta-blockers.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness or depression; may rarely cause insomnia, confusion, or nightmares

Mental Health: Effects on Psychiatric TreatmentConcurrent use with phenothiazines may potentiate hypotensive effects of penbutolol

Cardiovascular ConsiderationsThis drug possesses intrinsic sympathomimetic activity. While beta-blockers with intrinsic sympathomimetic activity induce fewer side effects, the cardiovascular benefits when used in patients with hypertension or heart failure are less clear than for beta-blockers without intrinsic sympathomimetic activity.

Hypertension: Beta-blocker therapy in the treatment of hypertension has been associated with improved cardiovascular outcomes. This class of drug is beneficial for elderly patients with hypertension. A recent UKPDS study showed that beta-blocker therapy (atenolol) was as effective as an ACE inhibitor in reducing cardiovascular events and that the benefits of therapy were related more to the degree of antihypertensive efficacy rather than the class of drug used.

Withdrawal: Beta-blocker therapy should not be withdrawn abruptly, but gradually tapered to avoid acute tachycardia and hypertension.

Anesthesia and Critical Care Concerns/Other ConsiderationsPenbutolol possesses intrinsic sympathomimetic activity. While beta-blockers with intrinsic sympathomimetic activity induce fewer side effects, the cardiovascular benefits are less clear.

Index TermsPenbutolol Sulfate

Medication Safety Issues

Sound-alike/look-alike issues:

Denavir® may be confused with indinavir

Pronunciation(pen SYE kloe veer)
U.S. Brand NamesDenavir®
Pharmacologic CategoryAntiviral Agent
Use: Labeled IndicationsTopical treatment of herpes simplex labialis (cold sores)
Use: DentalTopical treatment of herpes simplex labialis (cold sores)
Dosing: Adults**Herpes simplex labialis (cold sores):** Topical: Apply cream at the first sign or symptom of cold sore (eg, tingling, swelling); apply every 2 hours during waking hours for 4 days.
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Herpes simplex labialis (cold sores):** Children ≥12 years: Refer to adult dosing.
StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F).
ContraindicationsHypersensitivity to the penciclovir or any component of the formulation; previous and significant adverse reactions to famciclovir
Allergy Considerations

- Antiviral Acyclic Guanine Derivative Allergy

Warnings/Precautions

Special populations:

- Immunocompromised patients: The effect of penciclovir has not been established in immunocompromised patients.
- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Other warnings/precautions:

- Appropriate use: Should only be used on herpes labialis on the lips and face; because no data are available, application to mucous membranes is not recommended. Avoid application in or near eyes since it may cause irritation.

Pregnancy Risk FactorB
LactationExcretion in breast milk unknown
Adverse Reactions

>10%: Dermatologic: Mild erythema (50%)

1% to 10%: Central nervous system: Headache (5.3%)

<1%: Local anesthesia (0.9%)

Postmarketing and/or case reports: Application site reaction, local edema, urticaria, pain, pruritus, paresthesia, skin discoloration, erythematous rash, oropharyngeal edema, parosmia

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersReduction in virus shedding, negative cultures for herpesvirus; resolution of pain and healing of cold sore lesion
Nursing: Physical Assessment/MonitoringAssess for effectiveness of therapy. Teach patient appropriate application and use and adverse symptoms to report.
Patient EducationThis is not a cure for herpes (recurrences tend to appear within 3 months of original infection), nor will this medication reduce the risk of transmission to others when lesions are present. For external use only. Wash hands before and after application. Apply this film over affected areas at first sign of cold sore. Avoid use of other topical creams, lotions, or ointments unless approved by prescriber. You may experience headache, mild rash, or taste disturbances. **Breast-feeding precaution:** Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream: 1% (1.5 g)

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Cream (Denavir)

1% (1.5): $43.18

Mechanism of ActionIn cells infected with HSV-1 or HSV-2, viral thymidine kinase phosphorylates penciclovir to a monophosphate form which, in turn, is converted to penciclovir triphosphate by cellular kinases. Penciclovir triphosphate inhibits HSV polymerase competitively with deoxyguanosine triphosphate. Consequently, herpes viral DNA synthesis and, therefore, replication are selectively inhibited

Pharmacodynamics/KineticsAbsorption: Topical: None

Pharmacotherapy PearlsPenciclovir is the active metabolite of the prodrug famciclovir. Penciclovir is an alternative to topical acyclovir for HSV-1 and HSV-2 infections. Neither drug will prevent recurring HSV attacks.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

U.S. Brand NamesCuprimine®; Depen®

Canadian Brand NamesCuprimine®; Depen®

Pharmacologic CategoryChelating Agent

Use: Labeled IndicationsTreatment of Wilson's disease, cystinuria; adjunctive treatment of rheumatoid arthritis

Use: Unlabeled/InvestigationalChelation therapy for the treatment of lead poisoning (third-line agent); treatment of arsenic poisoning

Dosing: Adults

Rheumatoid arthritis: Oral: 125-250 mg/day, may increase dose at 1- to 3-month intervals up to 1-1.5 g/day (maximum in older adults: 750 mg/day)

Wilson's disease: Oral: 250 mg 4 times/day (maximum in older adults: 750 mg/day). **Note:** Dose titrated to maintain urinary copper excretion >2 mg/day; decrease dose for surgery and during last trimester of pregnancy

Cystinuria:Note: Adjust dose to limit cystine excretion to 100-200 mg/day (<100 mg/day with history of stone formation): Oral: 1-4 g/day in divided doses every 6 hours; usual dose: 2 g/day

Arsenic poisoning (unlabeled use): Oral: 500 mg 4 times/day for 5 days

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Rheumatoid arthritis (unlabeled use): Oral: Initial: 3 mg/kg/day (≤250 mg/day) for 3 months, then 6 mg/kg/day (≤500 mg/day) in divided doses twice daily for 3 months to a maximum of 10 mg/kg/day in 3-4 divided doses; maximum dose: 750 mg/day

Wilson's disease: Oral: **Note:** Doses titrated to maintain urinary copper excretion >2 mg/day (decrease dose for surgery): Children <12 years: 20 mg/kg/day in 2-3 divided doses, round off to the nearest 250 mg dose; maximum 1 g/day

Cystinuria: Children: 30 mg/kg/day in 4 divided doses. **Note:** Adjust dose to limit cystine excretion to 100-200 mg/day (<100 mg/day with history of stone formation).

Lead poisoning (unlabeled use): Oral: 20-30 mg/kg/day, administered in 3-4 divided doses; initiating treatment at 25% of this dose and gradually increasing to the full dose over 2-3 weeks may minimize adverse reactions. Doses of 15 mg/kg/day may also be effective and have less adverse effects (Shannon 2000). **Note:** For the treatment of high blood lead levels in children, the CDC recommends chelation treatment when blood lead levels are >45 mcg/dL (CDC, 2002). Children with blood lead levels >70 mcg/dL or symptomatic lead poisoning should be treated with parenteral agents (AAP, 2005).

Arsenic poisoning (unlabeled use): Oral: Children: 100 mg/kg/day in divided doses every 6 hours for 5 days; maximum: 1 g/day

Dosing: Renal ImpairmentCl_{cr} <50 mL/minute: Avoid use.

Hemodialysis: Dialyzable; a dosing decrease from 250 mg/day to 250 mg 3 times/week after dialysis has been suggested in the treatment of rheumatoid arthritis.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralFor patients who cannot swallow, contents of capsules may be administered in 15-30 mL of chilled puréed fruit or fruit juice. Give on an empty stomach (1 hour before meals and at bedtime).

Cystinuria: If administering 4 equal doses is not feasible, administer the larger dose at bedtime.

Rheumatoid arthritis: Doses ≤500 mg/day may be given as a single dose; >500 mg administer in divided doses

Dietary ConsiderationsShould be taken at least 1 hour before a meal on an empty stomach. Iron may decrease drug action. Patients with Wilson's disease or cystinuria should receive pyridoxine supplementation 25 mg/day. For Wilson's disease, decrease copper in diet to <1-2 mg/day and omit chocolate, nuts, shellfish, mushrooms, liver, raisins, broccoli, copper-enriched cereal, multivitamins with copper, and molasses. For lead poisoning, decrease calcium in diet. For cystinuria, increase daily fluid intake including 1 pint of fluid prior to bedtime and 1 additional pint during the night.

StorageStore in tight, well-closed containers.

Extemporaneously PreparedA 50 mg/mL suspension may be made by mixing twenty 250 mg capsules with 1 g carboxymethylcellulose, 50 g sucrose, 100 mg citric acid, parabens, and purified water to a total volume of 100 mL; cherry flavor may be added. Stability is 30 days refrigerated.

Nahata MC and Hipple TF, *Pediatric Drug Formulations*, 1st ed, Cincinnati, OH: Harvey Whitney Books Co, 1990.

ContraindicationsHypersensitivity to penicillamine or any component of the formulation; renal insufficiency (in patients with rheumatoid arthritis); patients with previous penicillamine-related aplastic anemia or agranulocytosis; breast-feeding; pregnancy (in patients with rheumatoid arthritis)

Warnings/Precautions

Boxed warnings:

- Experienced physician: See "Other warnings/precautions" below.
- Toxicity symptoms: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Allergic reactions: Approximately 33% of patients will experience an allergic reaction.
- Goodpasture's syndrome: Penicillamine has been associated with fatalities due to Goodpasture's syndrome.
- Hematologic toxicities: Penicillamine has been associated with fatalities due to agranulocytosis, aplastic anemia, and thrombocytopenia.
- Hepatotoxicity: Monitor liver function tests periodically due to rare reports of intrahepatic cholestasis or toxic hepatitis.
- Penicillin cross-sensitivity: Patients with a penicillin allergy may theoretically have cross-sensitivity to penicillamine; however, the possibility has been eliminated now that penicillamine is produced synthetically and no longer contains trace amounts of penicillin.
- Proteinuria/hematuria: Proteinuria or hematuria may develop; monitor for membranous glomerulopathy which can lead to nephrotic syndrome. In rheumatoid arthritis patients, discontinue if gross hematuria or persistent microscopic hematuria develop.
- Myasthenia gravis: Penicillamine has been associated with fatalities due to myasthenia gravis.
- Toxicity symptoms: **[U.S. Boxed Warning]: Patients should be warned to report promptly any symptoms suggesting toxicity (fever, sore throat, chills, bruising, or bleeding);** toxicity may be dose related.

Disease-related concerns:

- Cystinuria: Once instituted for cystinuria, continue treatment on a daily basis; interruptions of even a few days have been followed by hypersensitivity with reinstitution of therapy.
- Lead poisoning: Investigate, identify, and remove sources of lead exposure prior to treatment. Penicillamine is considered to be a third-line agent for the treatment of lead poisoning in children due to the overall toxicity associated with its use; penicillamine should only be used when unacceptable reactions have occurred with edetate CALCIUM disodium and succimer. Primary care providers should consult experts in chemotherapy of lead toxicity before using chelation drug therapy.
- Wilson's disease: Once instituted for Wilson's disease, continue treatment on a daily basis; interruptions of even a few days have been followed by hypersensitivity with reinstitution of therapy.

Concurrent drug therapy issues:

- Hematopoietic-depressant drugs: Use with caution in patients on other hematopoietic-depressant drugs (eg, gold, immunosuppressants, antimalarials, phenylbutazone); hematologic and renal adverse reactions are similar.

Special populations:

- Elderly: Use with caution in the elderly.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the close supervision of a physician familiar with the toxicity and dosage considerations.**

Geriatric ConsiderationsClose monitoring of elderly is necessary; since steady-state serum/tissue concentrations rise slowly, "go slow" with dose increase intervals; steady-state concentrations decline slowly after discontinuation suggesting extensive tissue distribution. Skin rashes and taste abnormalities occur more frequently in the elderly than in young adults; leukopenia, thrombocytopenia, and proteinuria occur with equal frequency in both younger adults and elderly. Since toxicity may be dose related, it is recommended not to exceed 750 mg/day in the elderly.

Pregnancy Risk FactorD

Pregnancy ConsiderationsBirth defects, including congenital cutix laxa and associated defects, have been reported in infants following penicillamine exposure during pregnancy. Use for the treatment of rheumatoid arthritis during pregnancy is contraindicated. Use for the treatment of cystinuria only if the possible benefits to the mother outweigh the potential risks to the fetus. Continued treatment of Wilson's disease during pregnancy protects the mother against relapse. Discontinuation has detrimental maternal and fetal effects. Daily dosage should be limited to 750 mg. For planned cesarean section, reduce dose to 250 mg/day for the last 6 weeks of pregnancy, and continue at this dosage until wound healing is complete.

LactationExcretion in breast milk unknown/contraindicated

Adverse ReactionsFrequency not defined, may vary by indication. Adverse effects requiring discontinuation of treatment have been reported in 20% to 30% of patients with Wilson's disease.

Cardiovascular: Vasculitis

Central nervous system: Anxiety, agitation, fever, hyperpyrexia, psychiatric disturbances; worsening neurologic symptoms (10% to 50% patients with Wilson's disease)

Dermatologic: Alopecia, cheilosis, dermatomyositis, exfoliative dermatitis, lichen planus, rash (early and late 5%), pemphigus, pruritus, skin friability increased, toxic epidermal necrolysis, urticaria, wrinkling (excessive), yellow nail syndrome

Endocrine & metabolic: Hypoglycemia, thyroiditis

Gastrointestinal: Anorexia, diarrhea (17%), epigastric pain, gingivostomatitis, glossitis, nausea, oral ulcerations, pancreatitis, peptic ulcer reactivation, taste alteration (12%), vomiting

Hematologic: Eosinophilia, hemolytic anemia, leukocytosis, leukopenia (2% to 5%), monocytosis, red cell aplasia, thrombocytopenia (4% to 5%), thrombotic thrombocytopenia purpura, thrombocytosis

Hepatic: Alkaline phosphatase increased, hepatic failure, intrahepatic cholestasis, toxic hepatitis

Local: Thrombophlebitis, white papules at venipuncture and surgical sites

Neuromuscular & skeletal: Arthralgia, dystonia, myasthenia gravis, muscle weakness, neuropathies, polyarthralgia (migratory, often with objective synovitis), polymyositis

Ocular: Diplopia, extraocular muscle weakness, optic neuritis, ptosis, visual disturbances

Otic: Tinnitus

Renal: Goodpasture's syndrome, hematuria, nephrotic syndrome, proteinuria (6%), renal failure, renal vasculitis

Respiratory: Asthma, interstitial pneumonitis, pulmonary fibrosis, obliterative bronchiolitis

Miscellaneous: Allergic alveolitis, anetoderma, elastosis perforans serpiginosa, lupus-like syndrome, lactic dehydrogenase increased, lymphadenopathy, mammary hyperplasia, positive ANA test

Drug Interactions

Antacids: May decrease the serum concentration of Penicillamine. *Risk D: Consider therapy modification*

Digoxin: Penicillamine may decrease the serum concentration of Digoxin. *Risk C: Monitor therapy*

Iron Salts: May decrease the absorption of Penicillamine. Only oral iron salts are a concern. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid or limit ethanol.

Food: Penicillamine serum levels may be decreased if taken with food. Do not administer with milk.

Monitoring ParametersUrinalysis, CBC with differential, platelet count, skin, lymph nodes, and body temperature twice weekly during the first month of therapy, then every 2 weeks for 5 months, then monthly; LFTs every 6 months

Cystinuria: Urinary cystine, annual X-ray for renal stones

Lead poisoning: Serum lead concentration (baseline and 7-21 days after completing chelation therapy); hemoglobin or hematocrit, iron status, free erythrocyte protoporphyrin or zinc protoporphyrin; neurodevelopmental changes

Wilson's disease: Serum copper, 24-hour urinary copper excretion, LFTs every 3 months during the first year of treatment

CBC: WBC <3500/mm^3, neutrophils <2000/mm^3, or monocytes >500/mm^3 indicate need to stop therapy immediately; platelet counts <100,000/mm^3 indicate need to stop therapy until numbers of platelets increase

Urinalysis: Monitor for proteinuria and hematuria. A quantitative 24-hour urine protein at 1- to 2-week intervals initially (first 2-3 months) is recommended if proteinuria develops; in patients with rheumatoid arthritis, discontinue or decrease dose with proteinuria >1 g/24 hours, progressively increasing proteinuria or hematuria.

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Assess results of laboratory tests, therapeutic effectiveness (dependent on purpose of therapy), and adverse reactions at beginning of therapy and periodically throughout therapy. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse

symptoms to report.
Monitoring: Lab TestsUrinalysis, CBC with differential, platelet count (twice weekly); weekly measurements of urinary and blood concentration of the intoxicating metal is indicated.

Cystinuria: Urinary cystine, annual X-ray for renal stones

Lead poisoning: Serum lead concentration (baseline and 7-21 days after completing chelation therapy); hemoglobin or hematocrit, iron status, free erythrocyte protoporphyrin or zinc protoporphyrin

Wilson's disease: Serum copper, 24-hour urinary copper excretion, LFTs every 3 months during the first year of treatment

CBC: WBC <3500/mm^3, neutrophils <2000/mm^3, or monocytes >500/mm^3 indicate need to stop therapy immediately. Quantitative 24-hour urine protein at 1- to 2-week intervals initially (first 2-3 months); urinalysis, LFTs occasionally; platelet counts <100,000/mm^3 indicate need to stop therapy until numbers of platelets increase.

Patient EducationTake this medication exactly as directed; do not increase dose without consulting prescriber. Capsules may be opened and contents mixed in 15-30 mL of chilled fruit juice or puree; do not take with milk or milk products. Avoid or limit alcohol and excess intake of vitamin A. It is preferable to take penicillamine on empty stomach, 1 hour before or 2 hours after meals. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake.

Wilson's disease: Avoid chocolate, shellfish, nuts, mushrooms, liver, broccoli, molasses.

Lead poisoning: Decrease dietary calcium.

Cystinuria: Take with large amounts of water

You may experience anorexia, nausea, vomiting (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report persistent fever or chills, unhealed sores, white spots or sores in mouth or vaginal area, extreme fatigue, or signs of infection; breathlessness, respiratory difficulty, or unusual cough; unusual bruising/bleeding; blood in urine, stool, mouth, or vomitus; swollen face or extremities; skin rash or itching; muscle pain or cramping; or pain on urination. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication; use appropriate contraceptives. Do not breast-feed

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Cuprimine®: 250 mg

Tablet:

Depen®: 250 mg

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Tablets (Depen Titratabs)

250 mg (30): $121.97

Mechanism of ActionChelates with lead, copper, mercury and other heavy metals to form stable, soluble complexes that are excreted in urine; depresses circulating IgM rheumatoid factor, depresses T-cell but not B-cell activity; combines with cystine to form a compound which is more soluble, thus cystine calculi are prevented
Pharmacodynamics/Kinetics

Onset of action: Rheumatoid arthritis: 2-3 months; Wilson's disease: 1-3 months

Absorption: 40% to 70%

Protein binding: 80% to albumin and ceruloplasmin

Metabolism: Hepatic (small amounts metabolized to s-methyl-d-penicillamine)

Half-life elimination: 1.7-3.2 hours

Time to peak, serum: ~2 hours

Excretion: Urine (30% to 60% as unchanged drug)

Related Information

- Antacid Drug Interactions

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Oral ulcerations, glossitis, gingivostomatitis, and taste alteration.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause anxiety, agitation, visual and psychic disturbances

Mental Health: Effects on Psychiatric Treatment May cause aplastic anemia; use caution with clozapine and carbamazepine. May cause dystonia. May cause thrombocytopenia; monitor in patients receiving valproate.

Index Terms D-3-Mercaptovaline; D-Penicillamine; β,β-Dimethylcysteine

Sound-alike/look-alike issues:

Penicillin may be confused with penicillamine

Pronunciation(pen i SIL in jee, pa REN ter al, AYE kwee us)

U.S. Brand NamesPfizerpen®

Canadian Brand NamesCrystapen®

Pharmacologic CategoryAntibiotic, Penicillin

Use: Labeled IndicationsTreatment of infections (including sepsis, pneumonia, pericarditis, endocarditis, meningitis, anthrax) caused by susceptible organisms; active against some gram-positive organisms, generally not *Staphylococcus aureus*; some gram-negative organisms such as *Neisseria gonorrhoeae*, and some anaerobes and spirochetes

Dosing: Adults

***Actinomyces*species:** I.V.: 10-20 million units/day divided every 4-6 hours for 4-6 weeks

Clostridium perfringens: I.V.: 24 million units/day divided every 4-6 hours with clindamycin

Corynebacterium diptheriae: I.V.: 2-3 million units/day in divided doses every 4-6 hours for 10-12 days

Erysipelas: I.V.: 1-2 million units every 4-6 hours

Erysipelothrix: I.V.: 2-4 million units every 4 hours

Fascial space infections: I.V.: 2-4 million units every 4-6 hours with metronidazole

Leptospirosis: I.V.: 1.5 million units every 6 hours for 7 days

Listeria: I.V.: 15-20 million units/day in divided doses every 4-6 hours for 2 weeks (meningitis) or 4 weeks (endocarditis)

Lyme disease (meningitis): I.V.: 20 million units/day in divided doses

Neurosyphilis: I.V.: 18-24 million units/day in divided doses every 4 hours (or by continuous infusion) for 10-14 days

Streptococcus:

Brain abscess: I.V.: 18-24 million units/day in divided doses every 4 hours with metronidazole

Endocarditis or osteomyelitis: I.V.: 3-4 million units every 4 hours for at least 4 weeks

Pregnancy (prophylaxis GBS): I.V.: 5 million units x 1 dose, then 2.5 million units every 4 hours until delivery (ACOG, 2002; CDC, 2002)

Skin and soft tissue: I.V.: 3-4 million units every 4 hours for 10 days

Toxic shock: I.V.: 24 million units/day in divided doses with clindamycin

Streptococcal pneumonia: I.V.: 2-3 million units every 4 hours

Whipple's disease: I.V.: 2 million units every 4 hours for 2 weeks, followed by oral trimethoprim/sulfamethoxazole or doxycycline for 1 year

Relapse or CNS involvement: 4 million units every 4 hours for 4 weeks

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Susceptible infections: I.M., I.V.:

Infants >1 month and Children: I.M., I.V.: 100,000-400,000 units/kg/day in divided doses every 4-6 hours (maximum dose: 24 million units/day)

***Meningitis*(gonococcal):** I.V.: 250,000 units/kg/day in 4 divided doses

Moderate infections: I.M., I.V.: 100,000-250,000 units/kg/day in 4 divided doses

Severe infections: I.M., I.V.: 250,000-400,000 units/kg/day in divided doses every 4-6 hours (maximum dose: 24 million units/day)

Syphilis (congenital): Infants: I.V.: 50,000 units/kg every 4-6 hours for 10 days

Dosing: Renal ImpairmentDosage modification is required in patients with renal insufficiency.

Uremic patients with Cl_{cr} >10 mL/minute/1.73 m^2: Administer full loading dose followed by $^1/_2$ of the loading dose given every 4-5 hours

Cl_{cr} <10 mL/minute/1.73 m^2: Administer full loading dose followed by $^1/_2$ of the loading dose given every 8-10 hours

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.Administer I.M. by deep injection in the upper outer quadrant of the buttock. Administer injection around-the-clock to promote less variation in peak and trough levels.

Administration: I.V.Usually administered by intermittent infusion. In some centers, large doses may be administered by continuous I.V. infusion.

Administration: I.V. DetailpH: 6-7.5

Dietary Considerations

Injection powder for reconstitution as potassium contains sodium 6.8 mg (0.3 mEq) and potassium 65.6 mg (1.68 mEq) per 1 million units

Injection solution (premixed) as a potassium contains sodium 23.5 mg (1.02 mEq) and potassium 66.5 mg (1.7 mEq) per 1 million units

Storage

Penicillin G potassium powder for injection should be stored below 86°F (30°C). Following reconstitution, solution may be stored for up to 7 days under refrigeration. Premixed bags for infusion should be stored in the freezer (-20°C to -4°F); frozen bags may be thawed at room temperature or in refrigerator. Once thawed, solution is stable for 14 days if stored in refrigerator or for 24 hours when stored at room temperature. Do not refreeze once thawed.

Penicillin G sodium powder for injection should be stored at controlled room temperature. Reconstituted solution may be stored under refrigeration for up to 3 days.

CompatibilityInactivated in acidic or alkaline solutions.

Penicillin G potassium:

Stable in dextran 6% in dextrose, dextran 6% in NS, D_5LR, $D_5{}^1/_4$NS, $D_5{}^1/_2$NS, D_5NS, D_5W, D_{10}W, LR, $^1/_2$NS, NS, hetastarch 6%; **incompatible** with dextran 70 6% in dextrose, dextran 40 10% in dextrose; **variable stability (consult detailed reference)** in fat emulsion 10%, peritoneal dialysis solutions.

Y-site administration: Compatible: Acyclovir, amiodarone, cyclophosphamide, diltiazem, enalaprilat, esmolol, fluconazole, foscarnet, heparin, heparin with hydrocortisone sodium succinate, hydromorphone, labetalol, magnesium sulfate, meperidine, morphine, nicardipine, perphenazine, potassium chloride, tacrolimus, theophylline, verapamil, vitamin B complex with C.

Compatibility in syringe: Compatible: Caffeine citrate, heparin. **Incompatible:** Metoclopramide.

Compatibility when admixed: Compatible: Ascorbic acid injection, calcium chloride, calcium gluconate, chloramphenicol, cimetidine, clindamycin, colistimethate, corticotropin, dimenhydrinate, diphenhydramine, ephedrine, erythromycin lactobionate, furosemide, hydrocortisone sodium succinate, kanamycin, lidocaine, magnesium sulfate, methylprednisolone sodium succinate, metronidazole, metronidazole with sodium bicarbonate, polymyxin B sulfate, potassium chloride, potassium chloride with vitamin B complex with C, procaine, prochlorperazine edisylate, ranitidine, verapamil. **Incompatible:** Aminophylline, amphotericin B, chlorpromazine, dopamine, floxacillin, hydroxyzine, metaraminol, pentobarbital, phenytoin, prochlorperazine mesylate, promazine, thiopental, vancomycin, vitamin B complex with C with oxytetracycline. **Variable (consult detailed reference):** Amikacin, heparin, lincomycin, promethazine, sodium bicarbonate, vitamin B complex with C.

Penicillin G sodium:

Stable in dextran 40 10%; **incompatible** with fat emulsion 10%; **variable stability (consult detailed reference)** in D_5W, NS, peritoneal dialysis solution.

Y-site administration: Compatible: Clarithromycin, levofloxacin.

Compatibility in syringe: Compatible: Caffeine citrate, chloramphenicol, cimetidine, colistimethate, dimenhydramine, gentamicin, heparin, kanamycin, lincomycin, pantoprazole, polymyxin B sulfate, streptomycin.

Compatibility when admixed: Compatible: Calcium chloride, calcium gluconate, chloramphenicol, clindamycin, colistimethate, diphenhydramine, erythromycin lactobionate, furosemide, gentamicin, hydrocortisone sodium succinate, kanamycin, polymyxin B sulfate, procaine, ranitidine, verapamil, vitamin B complex with C. **Incompatible:** Amphotericin B, bleomycin, chlorpromazine, cytarabine, floxacillin, hydroxyzine, methylprednisolone sodium succinate, prochlorperazine mesylate, promethazine, vancomycin. **Variable (consult detailed reference):** Heparin, lincomycin, potassium chloride.

ContraindicationsHypersensitivity to penicillin or any component of the formulation

Allergy Considerations

- Penicillin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Serious and occasionally severe or fatal hypersensitivity (anaphylactoid) reactions have been reported in patients on penicillin therapy, especially with a history of beta-lactam hypersensitivity, history of sensitivity to multiple allergens, or previous IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria). Use with caution in asthmatic patients.

- Neurovascular damage: Avoid intra-arterial administration or injection into or near major peripheral nerves or blood vessels since such injections may cause severe and/or permanent neurovascular damage.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment recommended. In the presence of concomitant hepatic impairment, further dosage adjustment may be needed.

- Seizure disorders: Use with caution in patients with a history of seizure disorder; high levels, particularly in the presence of renal impairment, may increase risk of seizures.

Special populations:

- Pediatrics: Neonates may have decreased renal clearance of penicillin and require frequent dosage adjustments depending on age.

Other warnings/precautions:

- Electrolyte imbalance: Product contains sodium and potassium; high doses of I.V. therapy may alter serum levels.

- Prolonged use: Extended duration of therapy or use associated with high serum concentrations (eg, in renal insufficiency) may be associated with an increased risk for some adverse reactions (neutropenia, hemolytic anemia, serum sickness).

Geriatric ConsiderationsDespite a reported prolonged half-life, it is usually not necessary to adjust the dose of penicillin G or VK in elderly to account for renal function changes with age, however, it is advised to calculate an estimated creatinine clearance and adjust dose accordingly.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events have not been observed in animal studies; therefore, penicillin G is classified as pregnancy category B. Penicillin crosses the placenta and distributes into amniotic fluid. There is no evidence of adverse fetal effects after penicillin use during pregnancy in humans. Penicillin G is the drug of choice for treatment of syphilis during pregnancy and penicillin G (parenteral/aqueous) is the drug of choice for the prevention of early-onset Group B Streptococcal (GBS) disease in newborns.

LactationEnters breast milk/compatible

Breast-Feeding ConsiderationsVery small amounts of penicillin G transfer into breast milk. Peak milk concentrations occur at approximately 1 hour after an IM dose and are higher if multiple doses are given. The manufacturer recommends that caution be exercised when administering penicillin to nursing women. Nondose-related effects could include modification of bowel flora and allergic sensitization.

Pregnancy & Lactation, In-Depth

- Penicillin G (Parenteral/Aqueous) in Pregnancy & Lactation

Adverse ReactionsFrequency not defined.

Central nervous system: Coma (high doses), hyperreflexia (high doses), seizures (high doses)

Dermatologic: Contact dermatitis, rash

Endocrine & metabolic: Electrolyte imbalance (high doses)

Gastrointestinal: Pseudomembranous colitis

Hematologic: Neutropenia, positive Coombs' hemolytic anemia (rare, high doses)

Local: Injection site reaction, phlebitis, thrombophlebitis

Neuromuscular & skeletal: Myoclonus (high doses)

Renal: Acute interstitial nephritis (high doses), renal tubular damage (high doses)

Miscellaneous: Anaphylaxis, hypersensitivity reactions (immediate and delayed), Jarisch-Herxheimer reaction, serum sickness

Drug Interactions

Fusidic Acid: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Methotrexate: Penicillins may decrease the excretion of Methotrexate. *Risk C: Monitor therapy*

Tetracycline Derivatives: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Penicillins. *Risk C: Monitor therapy*

Test InteractionsFalse-positive or negative urinary glucose determination using Clinitest®; positive Coombs' [direct]; false-positive urinary and/or serum proteins

Monitoring ParametersPeriodic electrolyte, hepatic, renal, cardiac and hematologic function tests during prolonged/high-dose therapy; observe for signs and symptoms of anaphylaxis during first dose

Nursing: Physical Assessment/MonitoringAssess results of culture and sensitivity tests and patient’s allergy history prior to starting therapy. Use with caution and monitor closely in presence of renal impairment or seizure disorder. Assess potential for interactions with other pharmacological agents (eg, decreased or increased levels/effects of penicillin G). Avoid intravascular or intra-arterial administration or injection into or near major peripheral nerves or blood vessels; may cause severe and/or permanent neurovascular damage. Advise patients with diabetes about use of Clinitest®; may cause false positive or negative. Assess effectiveness (resolution of infections) and adverse reactions (eg, hypersensitivity reactions, opportunistic infection [fever, chills, unhealed sores, white plaques in mouth or vagina, purulent vaginal discharge, fatigue], CNS changes, thrombophlebitis). Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsPerform culture and sensitivity before administering first dose; periodic electrolyte, hepatic, renal, cardiac and hematologic function tests during prolonged/high-dose therapy

Patient EducationThis drug can only be given by injection or infusion. Report immediately any redness, swelling, burning, or pain at infusion site or any signs of allergic reaction (eg, respiratory or swallowing difficulty, chest tightness, rash, hives, swelling of lips or mouth). Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. If being treated for sexually-transmitted disease, partner will also need to be treated. If you have diabetes, drug may cause false test results with Clinitest®, consult prescriber for alternative method of glucose monitoring. May cause confusion or drowsiness (use caution when driving or engaging in tasks that require alertness until response to drug is known). Report persistent adverse effects or signs of opportunistic infection (eg, fever, chills, diarrhea, unhealed sores, white plaques in mouth or vagina, purulent vaginal discharge, fatigue).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Infusion, as potassium [premixed iso-osmotic dextrose solution, frozen]: 1 million units (50 mL), 2 million units (50 mL), 3 million units (50 mL) [contains sodium 1.02 mEq and potassium 1.7 mEq per 1 million units]

Injection, powder for reconstitution, as potassium (Pfizerpen®): 5 million units, 20 million units [contains sodium 6.8 mg (0.3 mEq) and potassium 65.6 mg (1.68 mEq) per 1 million units]

Injection, powder for reconstitution, as sodium: 5 million units [contains sodium 1.68 mEq per 1 million units]

Generic AvailableYes

Mechanism of ActionInterferes with bacterial cell wall synthesis during active multiplication, causing cell wall death and resultant bactericidal activity against susceptible bacteria

Pharmacodynamics/Kinetics

Distribution: Poor penetration across blood-brain barrier, despite inflamed meninges

Relative diffusion from blood into CSF: Poor unless meninges inflamed (exceeds usual MICs)

CSF:blood level ratio: Normal meninges: <1%; Inflamed meninges: 2% to 6%

Protein binding: 65%

Metabolism: Hepatic (30%) to penicilloic acid

Half-life elimination:

Neonates: <6 days old: 3.2-3.4 hours; 7-13 days old: 1.2-2.2 hours; >14 days old: 0.9-1.9 hours

Children and Adults: Normal renal function: 30-50 minutes

End-stage renal disease: 3.3-5.1 hours

Time to peak, serum: I.M.: ~30 minutes; I.V.: ~1 hour

Excretion: Urine (58% to 85% as unchanged drug)

Penicillin G Benzathine and Penicillin G Procaine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Bicillin® C-R (penicillin G benzathine and penicillin G procaine) may be confused with Bicillin® L-A (penicillin G benzathine). Penicillin G benzathine is the only product currently approved for the treatment of syphilis. Administration of penicillin G benzathine and penicillin G procaine combination instead of Bicillin® L-A may result in inadequate treatment response.

Penicillin G benzathine may only be administered by deep intramuscular injection; intravenous administration of penicillin G benzathine has been associated with cardiopulmonary arrest and death.

Sound-alike/look-alike issues:

Penicillin may be confused with penicillamine

Bicillin® may be confused with Wycillin®

Pronunciation(pen i SIL in jee BENZ a theen & pen i SIL in jee PROE kane)

U.S. Brand NamesBicillin® C-R; Bicillin® C-R 900/300

Pharmacologic CategoryAntibiotic, Penicillin

Use: Labeled IndicationsMay be used in specific situations in the treatment of streptococcal infections

Dosing: AdultsStreptococcal infections: I.M.: 2.4 million units in a single dose

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricStreptococcal infections: I.M.:

Children:

<14 kg: 600,000 units in a single dose

14-27 kg: 900,000 units to 1.2 million units in a single dose

Children >27 kg: Refer to adult dosing.

StorageRefrigerate

ContraindicationsHypersensitivity to penicillin or any component of the formulation

Allergy Considerations

- Penicillin Allergy

Warnings/Precautions

Boxed warnings:

- Intravenous administration: See “Other warnings/precautions” below.

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Serious and occasionally severe or fatal hypersensitivity (anaphylactoid) reactions have been reported in patients on penicillin therapy, especially with a history of beta-lactam hypersensitivity, history of sensitivity to multiple allergens, or previous IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria). Use with caution in asthmatic patients.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment.

Other warnings/precautions:

- Intravenous administration: **[U.S. Boxed Warning]: Not for intravenous use; cardiopulmonary arrest and death have occurred from inadvertent I.V. administration.**

- Prolonged use: Extended duration of therapy or use associated with high serum concentrations (eg, in renal insufficiency) may be associated with an increased risk for some adverse reactions (neutropenia, hemolytic anemia, serum sickness).

Geriatric ConsiderationsNo adjustment for renal function or age is necessary.

Pregnancy Risk FactorB

Pregnancy ConsiderationsSee individual agents.

Breast-Feeding ConsiderationsSee individual agents.

Pregnancy & Lactation, In-Depth

- Penicillin G Benzathine in Pregnancy & Lactation
- Penicillin G Procaine in Pregnancy & Lactation

Adverse ReactionsFrequency not defined.

Central nervous system: CNS toxicity (convulsions, confusion, drowsiness, myoclonus)

Hematologic: Positive Coombs' reaction, hemolytic anemia

Renal: Interstitial nephritis

Miscellaneous: Hypersensitivity reactions, Jarisch-Herxheimer reaction

Drug Interactions

Fusidic Acid: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Methotrexate: Penicillins may decrease the excretion of Methotrexate. *Risk C: Monitor therapy*

Tetracycline Derivatives: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Penicillins. *Risk C: Monitor therapy*

Test InteractionsMay interfere with urinary glucose tests using cupric sulfate (Benedict's solution, Clinitest®); may inactivate aminoglycosides *in vitro*; positive Coombs' [direct], increased protein

Monitoring ParametersObserve for signs and symptoms of anaphylaxis during first dose

Patient Education

Report persistent diarrhea.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, suspension [prefilled syringe]:

Bicillin® C-R:

600,000 units: Penicillin G benzathine 300,000 units and penicillin G procaine 300,000 units per 1 mL (1 mL) [DSC]

1,200,000 units: Penicillin G benzathine 600,000 units and penicillin G procaine 600,000 units per 2 mL (2 mL)

2,400,000 units: Penicillin G benzathine 1,200,000 units and penicillin G procaine 1,200,000 units per 4 mL (4 mL) [DSC]

Bicillin® C-R 900/300: 1,200,000 units: Penicillin G benzathine 900,000 units and penicillin G procaine 300,000 units per 2 mL (2 mL)

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Suspension (Bicillin C-R (1200000))

300000-300000 units/mL (20): $429.99

Mechanism of ActionInhibits bacterial cell wall synthesis by binding to one or more of the penicillin binding proteins (PBPs); which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay rarely cause drowsiness or confusion

Mental Health: Effects on Psychiatric TreatmentNone reported

Penicillin may be confused with penicillamine

Bicillin® may be confused with Wycillin®

Bicillin® C-R (penicillin G benzathine and penicillin G procaine) may be confused with Bicillin® L-A (penicillin G benzathine). Penicillin G benzathine is the only product currently approved for the treatment of syphilis. Administration of penicillin G benzathine and penicillin G procaine combination instead of Bicillin® L-A may result in inadequate treatment response.

Penicillin G benzathine may only be administered by deep intramuscular injection; intravenous administration of penicillin G benzathine has been associated with cardiopulmonary arrest and death.

Pronunciation(pen i SIL in jee BENZ a theen)

U.S. Brand NamesBicillin® L-A

Canadian Brand NamesBicillin® L-A

Pharmacologic CategoryAntibiotic, Penicillin

Use: Labeled IndicationsActive against some gram-positive organisms, few gram-negative organisms such as *Neisseria gonorrhoeae*, and some anaerobes and spirochetes; used in the treatment of syphilis; used only for the treatment of mild to moderately severe infections caused by organisms susceptible to low concentrations of penicillin G or for prophylaxis of infections caused by these organisms

Dosing: Adults**Note:** Not indicated as single drug therapy for neurosyphilis, but may be given 1 time/week for 3 weeks following I.V. treatment (refer to Penicillin G monograph for dosing)

Group A streptococcal upper respiratory infection: I.M.: 1.2 million units as a single dose

Prophylaxis of recurrent rheumatic fever: I.M.: 1.2 million units every 3-4 weeks or 600,000 units twice monthly

Syphilis:

Early: I.M.: 2.4 million units as a single dose in 2 injection sites

More than 1-year duration: I.M.: 2.4 million units in 2 injection sites once weekly for 3 doses

Neurosyphilis: Not indicated as single-drug therapy, but may be given once weekly for 3 weeks following I.V. treatment; refer to Penicillin G Parenteral/Aqueous monograph for dosing

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Congenital syphilis (asymptomatic): I.M.: Neonates >1200 g: 50,000 units/kg as a single dose

Group A streptococcal upper respiratory infection: I.M.: Infants and Children: 25,000-50,000 units/kg as a single dose (maximum: 1.2 million units)

Prophylaxis of recurrent rheumatic fever: I.M.: Infants and Children: 25,000-50,000 units/kg every 3-4 weeks (maximum: 1.2 million units/dose)

Syphilis:

Early: I.M.: Infants and Children: 50,000 units/kg as a single injection (maximum: 2.4 million units)

More than 1-year duration: I.M.: Infants and Children: 50,000 units/kg every week for 3 doses (maximum: 2.4 million units/dose)

Administration: I.M.Administer by deep I.M. injection in the upper outer quadrant of the buttock. Do **not** give I.V., intra-arterially, or SubQ. When doses are repeated, rotate the injection site.

StorageRefrigerate

ContraindicationsHypersensitivity to penicillin or any component of the formulation

Allergy Considerations

- Penicillin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Serious and occasionally severe or fatal hypersensitivity (anaphylactoid) reactions have been reported in patients on penicillin therapy, especially with a history of beta-lactam hypersensitivity, history of sensitivity to multiple allergens, or previous IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria). Use with caution in asthmatic patients.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment.
- Seizure disorders: Use with caution in patients with a history of seizure disorder; high levels, particularly in the presence of renal impairment, may increase risk of seizures.
- Syphilis/neurosyphilis use: CDC and AAP do not currently recommend the use of penicillin G benzathine to treat congenital syphilis or neurosyphilis due to reported treatment failures and lack of published clinical data on its efficacy.

Other warnings/precautions:

- Prolonged use: Extended duration of therapy or use associated with high serum concentrations (eg, in renal insufficiency) may be associated with an increased risk for some adverse reactions (neutropenia, hemolytic anemia, serum sickness).

Geriatric ConsiderationsNot indicated as single drug therapy for neurosyphilis, but may be given 1 time/week for 3 weeks following I.V. treatment with Penicillin G (Parenteral/Aqueous). No adjustment for renal function or age is necessary.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events have not been observed in animal studies; therefore, penicillin G is classified as pregnancy category B. Penicillin crosses the placenta and distributes into amniotic fluid. There is no evidence of adverse fetal effects after penicillin use during pregnancy in humans. Penicillin G is the drug of choice for treatment of syphilis during pregnancy.

LactationEnters breast milk/compatible

Breast-Feeding ConsiderationsPenicillins are excreted in breast milk. The manufacturer recommends that caution be exercised when administering penicillin to nursing women. Nondose-related effects could include modification of bowel flora and allergic sensitization.

Pregnancy & Lactation, In-Depth

- Penicillin G Benzathine in Pregnancy & Lactation

Adverse ReactionsFrequency not defined.

Central nervous system: Convulsions, confusion, drowsiness, myoclonus, fever

Dermatologic: Rash

Endocrine & metabolic: Electrolyte imbalance

Hematologic: Positive Coombs' reaction, hemolytic anemia

Local: Pain, thrombophlebitis

Renal: Acute interstitial nephritis

Miscellaneous: Anaphylaxis, hypersensitivity reactions, Jarisch-Herxheimer reaction

Drug Interactions

Fusidic Acid: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Methotrexate: Penicillins may decrease the excretion of Methotrexate. *Risk C: Monitor therapy*

Tetracycline Derivatives: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Penicillins. *Risk C: Monitor therapy*

Test InteractionsPositive Coombs' [direct], false-positive urinary and/or serum proteins; false-positive or negative urinary glucose using Clinitest®

Monitoring ParametersObserve for signs and symptoms of anaphylaxis during first dose

Nursing: Physical Assessment/MonitoringAssess results of culture and sensitivity tests and patient’s allergy history prior to starting therapy. Use with caution in presence of impaired renal function or history of seizures. Assess potential for interactions with other pharmacological agents patient may be taking (eg, increase or decrease levels/effect of penicillin). Advise patients with diabetes about use of Clinitest®; may cause false readings. Assess for therapeutic effectiveness (resolution of infection) and adverse reactions (eg, hypersensitivity reactions, opportunistic infection). Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsPerform culture and sensitivity before administering first dose.

Patient EducationThis drug can only be given by injection. Report immediately any redness, swelling, burning, or pain at injection site or any signs of allergic reaction (eg, respiratory difficulty or swallowing, chest tightness, rash, hives, swelling of lips or mouth). Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. If being treated for sexually-transmitted disease, partner will also need to be treated. If you have diabetes, drug may cause false test results with Clinitest®; consult prescriber for alternative method of glucose monitoring. May cause confusion or drowsiness (use caution when driving or engaging in tasks that require alertness until response to drug is known). Report persistent adverse effects or signs of opportunistic infection (eg, fever, chills, diarrhea, unhealed sores, white plaques in mouth or vagina, purulent vaginal discharge, fatigue).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, suspension [prefilled syringe]: 600,000 units/mL (1 mL, 2 mL, 4 mL)

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Suspension (Bicillin L-A)

2400000 units/4 mL (4): $89.99

Mechanism of ActionInterferes with bacterial cell wall synthesis during active multiplication, causing cell wall death and resultant bactericidal activity against susceptible bacteria

Pharmacodynamics/Kinetics

Duration: 1-4 weeks (dose dependent); larger doses result in more sustained levels

Distribution: Highest levels in the kidney; lesser amounts in liver, skin, intestines

Protein Binding: ~60%

Absorption: I.M.: Slow

Time to peak, serum: 12-24 hours

Related Information

Medication Safety Issues

Sound-alike/look-alike issues:

Penicillin G procaine may be confused with penicillin V potassium

Wycillin® may be confused with Bicillin®

Pronunciation(pen i SIL in jee PROE kane)

Canadian Brand NamesPfizerpen-AS®; Wycillin®

Pharmacologic CategoryAntibiotic, Penicillin

Use: Labeled IndicationsTreatment of moderately-severe infections due to *Treponema pallidum* and other penicillin G-sensitive microorganisms that are susceptible to low, but prolonged serum penicillin concentrations; anthrax due to *Bacillus anthracis* (postexposure) to reduce the incidence or progression of disease following exposure to aerolized *Bacillus anthracis*

Dosing: Adults

Anthrax:

Inhalational (postexposure prophylaxis): I.M.: 1,200,000 units every 12 hours

Note: Overall treatment duration should be 60 days. Available safety data suggest continued administration of penicillin G procaine for longer than 2 weeks may incur additional risk of adverse reactions. Clinicians may consider switching to effective alternative treatment for completion of therapy beyond 2 weeks.

Cutaneous (treatment): I.M.: 600,000-1,200,000 units/day; alternative therapy is recommended in severe cutaneous or other forms of anthrax infection

Endocarditis caused by susceptible viridans*Streptococcus*(when used in conjunction with an aminoglycoside): I.M.: 1.2 million units every 6 hours for 2-4 weeks

Gonorrhea (uncomplicated): 4.8 million units as a single dose divided in 2 sites given 30 minutes after probenecid 1 g orally

Neurosyphilis: I.M.: 2.4 million units/day with 500 mg probenecid by mouth 4 times/day for 10-14 days; **penicillin G aqueous I.V. is the preferred agent**

Whipple's disease: I.M.: 1.2 million units/day (with streptomycin) for 10-14 days, followed by oral trimethoprim/sulfamethoxazole or doxycycline for 1 year

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Susceptible infections: I.M.: Infants and Children: 25,000-50,000 units/kg/day in divided doses 1-2 times/day; not to exceed 4.8 million units/24 hours

Anthrax, inhalational (postexposure prophylaxis): I.M.: 25,000 units/kg every 12 hours (maximum: 1,200,000 units every 12 hours).

Note: Overall treatment duration should be 60 days. Available safety data suggest continued administration of penicillin G procaine for longer than 2 weeks may incur additional risk for adverse reactions. Clinicians may consider switching to effective alternative treatment for completion of therapy beyond 2 weeks.

Syphilis (congenital): I.M.: 50,000 units/kg/day once daily for 10 days; if more than 1 day of therapy is missed, the entire course should be restarted

Dosing: Renal Impairment

Cl_{cr} 10-30 mL/minute: Administer every 8-12 hours.

Cl_{cr} <10 mL/minute: Administer every 12-18 hours.

Moderately dialyzable (20% to 50%)

Administration: I.M.Procaine suspension is for deep I.M. injection only. Rotate the injection site. Do not inject in gluteal muscle in children <2 years of age.

StorageRefrigerate

ContraindicationsHypersensitivity to penicillin, procaine, or any component of the formulation

Allergy Considerations

- Penicillin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Serious and occasionally severe or fatal hypersensitivity (anaphylactoid) reactions have been reported in patients on penicillin therapy, especially with a history of beta-lactam hypersensitivity, history of sensitivity to multiple allergens, or previous IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria). Use with caution in asthmatic patients.

- Neurovascular damage: Avoid I.V., intravascular, or intra-arterial administration since severe and/or permanent neurovascular damage may occur.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with severe renal impairment; dosage adjustment recommended.

- Seizure disorders: Use with caution in patients with a history of seizure disorder; high levels, particularly in the presence of renal impairment, may increase risk of seizures.

Other warnings/precautions:

- Prolonged use: Extended duration of therapy or use associated with high serum concentrations (eg, in renal insufficiency) may be associated with an increased risk for some adverse reactions (neutropenia, hemolytic anemia, serum sickness).

Geriatric ConsiderationsDosage does not usually need to be adjusted in the elderly, however, if multiple doses are to be given, adjust dose for renal function.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events have not been observed in animal studies; therefore, penicillin G is classified as pregnancy category B. Penicillin crosses the placenta and distributes into amniotic fluid. There is no evidence of adverse fetal effects after penicillin use during pregnancy in humans.

LactationEnters breast milk/compatible

Breast-Feeding ConsiderationsPenicillins are excreted in breast milk. The manufacturer recommends that caution be exercised when administering penicillin to nursing women. Nondose-related effects could include modification of bowel flora and allergic sensitization.

Pregnancy & Lactation, In-Depth

- Penicillin G Procaine in Pregnancy & Lactation

Adverse ReactionsFrequency not defined.

Cardiovascular: Myocardial depression, vasodilation, conduction disturbances

Central nervous system: Confusion, drowsiness, myoclonus, CNS stimulation, seizure

Hematologic: Positive Coombs' reaction, hemolytic anemia, neutropenia

Local: Pain at injection site, thrombophlebitis, sterile abscess at injection site

Renal: Interstitial nephritis

Miscellaneous: Pseudoanaphylactic reactions, hypersensitivity reactions, Jarisch-Herxheimer reaction, serum sickness

Drug Interactions

Fusidic Acid: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Methotrexate: Penicillins may decrease the excretion of Methotrexate. *Risk C: Monitor therapy*

Tetracycline Derivatives: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Penicillins. *Risk C: Monitor therapy*

Test InteractionsPositive Coombs' [direct], false-positive urinary and/or serum proteins

Monitoring ParametersPeriodic renal and hematologic function tests with prolonged therapy; fever, mental status, WBC count

Nursing: Physical Assessment/MonitoringAssess results of culture and sensitivity tests and patient's allergy history prior to starting therapy. Use with caution and monitor closely in presence of renal impairment or seizure disorder. Assess potential for interactions with other pharmacological agents (eg, decreased or increased levels/effects of penicillin G). Avoid intravascular or intra-arterial administration or injection into or near major peripheral nerves or blood vessels; may cause severe and/or permanent neurovascular damage. Advise patients with diabetes about use of Clinitest®; may cause false positive or negative. Assess effectiveness (resolution of infections) and adverse reactions (eg, hypersensitivity reactions, opportunistic infection [fever, chills, unhealed sores, white plaques in mouth or vagina, purulent vaginal discharge, fatigue], CNS changes, thrombophlebitis). Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsPeriodic renal and hematologic function with prolonged therapy; WBC count; perform culture and sensitivity before administering first dose.

Patient EducationThis drug can only be given by injection. Report immediately any redness, swelling, burning, or pain at injection site or any signs of allergic reaction (eg, respiratory or swallowing difficulty, chest tightness, rash, hives, swelling of lips or mouth). Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. If being treated for sexually-transmitted disease, partner will also need to be treated. If you have diabetes, drug may cause false test results with Clinitest®, consult prescriber for alternative method of glucose monitoring. May cause confusion or drowsiness (use caution when driving or engaging in tasks that require alertness until response to drug is known). Report persistent adverse effects or signs of opportunistic infection (eg, fever, chills, diarrhea, unhealed sores, white plaques in mouth or vagina, purulent vaginal discharge, fatigue).

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, suspension: 600,000 units/mL (1 mL, 2 mL)

Generic Available Yes

Mechanism of Action Inhibits bacterial cell wall synthesis by binding to one or more of the penicillin binding proteins (PBPs); which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.

Pharmacodynamics/Kinetics

Duration: Therapeutic: 15-24 hours

Absorption: I.M.: Slow

Distribution: Penetration across the blood-brain barrier is poor, despite inflamed meninges

Protein binding: 65%

Metabolism: ~30% hepatically inactivated

Time to peak, serum: 1-4 hours

Excretion: Urine (60% to 90% as unchanged drug)

Clearance: Renal: Delayed in neonates, young infants, and with impaired renal function

Related Information

Penicillin V procaine may be confused with penicillin G potassium

Pronunciation(pen i SIL in vee poe TASS ee um)
Canadian Brand NamesApo-Pen VK®; Novo-Pen-VK; Nu-Pen-VK
Pharmacologic CategoryAntibiotic, Penicillin
Use: Labeled IndicationsTreatment of infections caused by susceptible organisms involving the respiratory tract, otitis media, sinusitis, skin, and urinary tract; prophylaxis in rheumatic fever
Use: DentalAntibiotic of first choice in treatment of common orofacial infections caused by aerobic gram-positive cocci and anaerobes. These orofacial infections include cellulitis, periapical abscess, periodontal abscess, acute suppurative pulpitis, oronasal fistula, pericoronitis, osteitis, osteomyelitis, postsurgical and post-traumatic infection. **Note: This agent is no longer recommended for dental procedure prophylaxis.**
Dosing: Adults

Acintomycosis:

Mild: 2-4 g/day in 4 divided doses for 8 weeks

Surgical: 2-4 g/day in 4 divided doses for 6-12 months (after I.V. penicillin G therapy of 4-6 weeks)

Erysipelas: 500 mg 4 times/day

Pharyngitis (streptococcal): 500 mg 3-4 times/day for 10 days

Prophylaxis of pneumococcal or recurrent rheumatic fever infections: 250 mg twice daily

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Pharyngitis (streptococcal): 250 mg 2-3 times/day for 10 days

Prophylaxis of pneumococcal infections:

Children <5 years: 125 mg twice daily

Children ≥5 years: 250 mg twice daily

Prophylaxis of recurrent rheumatic fever:

Children <5 years: 125 mg twice daily

Children ≥5 years: 250 mg twice daily

Dosing: Renal Impairment

Cl_{cr} 10-50 mL/minute: Administer every 8-12 hours.

Cl_{cr} <10 mL/minute: Administer every 12-16 hours.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V. DetailpH: 6.0-8.5
Administration: OralAdminister around-the-clock to promote less variation in peak and trough serum levels. Take on an empty stomach 1 hour before or 2 hours after meals, to enhance absorption, take until gone, do not skip doses.
Dietary ConsiderationsTake on an empty stomach 1 hour before or 2 hours after meals.
StorageRefrigerate suspension after reconstitution; discard after 14 days.
ContraindicationsHypersensitivity to penicillin or any component of the formulation
Allergy Considerations

- Penicillin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Serious and occasionally severe or fatal hypersensitivity (anaphylactoid) reactions have been reported in patients on penicillin therapy, especially with a history of beta-lactam hypersensitivity, history of sensitivity to multiple allergens, or previous IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria). Use with caution in asthmatic patients.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Renal impairment: Use with caution in patients with severe renal impairment; dosage adjustment recommended.

- Seizure disorders: Use with caution in patients with a history of seizure disorder; high levels, particularly in the presence of renal impairment, may increase risk of seizures.

Other warnings/precautions:

- Prolonged use: Extended duration of therapy or use associated with high serum concentrations (eg, in renal insufficiency) may be associated with an increased risk for some adverse reactions (neutropenia, hemolytic anemia, serum sickness).

Geriatric ConsiderationsDosage adjustment in the elderly is usually not necessary.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events have not been observed in animal studies; therefore, penicillin V is classified as pregnancy category B. Penicillin crosses the placenta and distributes into amniotic fluid. There is no evidence of adverse fetal effects after penicillin use during pregnancy in humans. Due to pregnancy-induced physiologic changes, some pharmacokinetic parameters of penicillin V may be altered in the second and third trimester. Higher doses or increased dosing frequency may be required.

LactationEnters breast milk/compatible

Breast-Feeding ConsiderationsPenicillins are excreted in breast milk. The manufacturer recommends that caution be exercised when administering penicillin to nursing women. Nondose-related effects could include modification of bowel flora and allergic sensitization.

Pregnancy & Lactation, In-Depth

- Penicillin V Potassium in Pregnancy & Lactation

Adverse Reactions

>10%: Gastrointestinal: Mild diarrhea, vomiting, nausea, oral candidiasis

<1%: Convulsions, fever, hemolytic anemia, positive Coombs' reaction, acute interstitial nephritis, hypersensitivity reactions, anaphylaxis

Drug Interactions

Fusidic Acid: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Methotrexate: Penicillins may decrease the excretion of Methotrexate. *Risk C: Monitor therapy*

Tetracycline Derivatives: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Penicillins. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Decreases drug absorption rate; decreases drug serum concentration.

Test InteractionsFalse-positive or negative urinary glucose determination using Clinitest®; positive Coombs' [direct]; false-positive urinary and/or serum proteins

Monitoring ParametersPeriodic renal and hematologic function tests during prolonged therapy; monitor for signs of anaphylaxis during first dose

Nursing: Physical Assessment/MonitoringAssess results of culture and sensitivity tests and patient’s allergy history prior to starting therapy. Use with caution in presence of renal impairment. Assess potential for interactions with other pharmacological agents (eg, decreased or increased levels/effects of penicillin V). Assess results of laboratory tests, effectiveness (resolution of infection), and adverse reactions (eg, hypersensitivity reactions, opportunistic infection [fever, chills, unhealed sores, white plaques in mouth or vagina, purulent vaginal discharge, fatigue]). Advise patients with diabetes about use of Clinitest®; may cause false readings. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsPeriodic renal and hematologic function during prolonged therapy; perform culture and sensitivity before administering first dose.

Patient EducationTake as directed at intervals around-the-clock, preferable on an empty stomach (1 hour before or 2 hours after a meal). Take entire prescription; do not skip doses or discontinue without consulting prescriber. Take a missed dose as soon as possible. If almost time for next dose, skip the missed dose and return to your regular schedule. Do not take a double dose. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. If you have diabetes, drug may cause false test results with Clinitest®, consult prescriber for alternative method of glucose monitoring. May cause nausea or vomiting (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or diarrhea (buttermilk, boiled milk, or yogurt may help). Report persistent adverse effects; signs of opportunistic infection (eg, fever, chills, diarrhea, unhealed sores, white plaques in mouth or vagina, purulent vaginal discharge, fatigue); or signs of hypersensitivity reaction (rash, hives, itching, swelling of lips, tongue, mouth, or throat).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Note: 250 mg = 400,000 units

Powder for oral solution: 125 mg/5 mL (100 mL, 200 mL); 250 mg/5 mL (100 mL, 200 mL)

Tablet: 250 mg, 500 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (reconstituted) (Penicillin V Potassium)

250 mg/5 mL (100): $12.99

Tablets (Penicillin V Potassium)

250 mg (30): $12.99

500 mg (30): $22.99

Tablets (Veetids)

500 mg (30): $13.99

Mechanism of ActionInhibits bacterial cell wall synthesis by binding to one or more of the penicillin binding proteins (PBPs); which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.

Pharmacodynamics/Kinetics

Absorption: 60% to 73%

Distribution: Widely distributed to kidneys, liver, skin, tonsils, and into synovial, pleural, and pericardial fluids

Protein binding, plasma: 80%

Half-life elimination: 30 minutes; prolonged with renal impairment

Time to peak, serum: 0.5-1 hour

Excretion: Urine (as unchanged drug and metabolites)

Related Information

(pen ta flure oh PRO pane & tet ra flure oh ETH ane)

U.S. Brand NamesGebauer's Instant Ice™ [OTC]; Gebauer's Pain Ease®; Gebauer's Spray and Stretch®

Pharmacologic CategoryAnesthetic, Topical

Use: Labeled Indications

Treatment of myofascial pain, restricted motion due to muscle tension, muscle spasm and minor sports injuries (eg, bruises, contusions, swelling, minor sprains); pain associated with injections or minor surgical procedures

Dosing: Adults

Myofascial pain, restricted motion, muscle tension: Topical: Spray over affected muscle at a rate of ~4 inches/second (10 cm/second), including muscle attachment, trigger point, and reference zone; may repeat if necessary. **Note:** Passively stretch the muscle during application.

Temporary relief of minor sports injury, preinjection anesthesia, anesthetic in minor surgery: Topical: Dosage varies with duration of application. Spray over affected area for 4-10 seconds from a distance of 3-7 inches (8-18 cm); spray until skin begins to turn white; do not frost the skin. Reapply as needed.

Dosing: ElderlyRefer to adult dosing.

Administration: Topical

For external use only. Discontinue if skin becomes irritated. Do not use near face, open wounds, or abraded skin. Adjacent skin areas may be protected with petroleum.

Myofascial pain: Aim the spray so it meets the skin at an acute angle. Direct in parallel sweeps 0.5-1 inches apart at the rate of 4 inches/second. Passively stretch the muscle during application; increase the force of the stretch with successive sweeps. As the muscle relaxes, establish a new stretch length. For complete pain relief, the full, normal length of the muscle must be reached. Apply moist heat for 10-15 minutes after treatment. Avoid use on unaffected area.

Sports injuries: Spray until the skin begins to turn white. Avoid use on unaffected areas.

StorageStore at room temperature. Avoid exposure to temperatures ≥49°C (≥120°F). Do not puncture or incinerate container.

Contraindications

Hypersensitivity to pentafluoropropane, tetrafluoroethane, or any other component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Skin irritation: Discontinue if skin becomes irritated.
- Skin pigmentation: Overuse may alter skin pigmentation.

Disease-related concerns:

- Diabetes: Use with caution in patients with diabetes mellitus.
- Poor circulation: Use with caution in patients with poor circulation.

Other warnings/precautions:

- Appropriate use: For external use only; do not use on large areas of damaged skin, puncture wounds, animal bites, serious wounds, or genital mucous membranes. Provides temporary relief (<1 minute) in sports injuries; initiate other therapy as soon as possible.
- OTC labeling: Do not spray near face, on open wounds, or abraded skin.

Pregnancy ConsiderationsTeratogenic effects were not noted in animal studies.

Adverse Reactions

Frequency not defined.

Dermatologic: Skin irritation, skin pigmentation change, frostbite

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Aerosol, topical spray:

Gebauer's Spray and Stretch®: Pentafluoropropane 95% and tetrafluoroethane 5% (103.5 mL) [available in fine stream spray]

Gebauer's Pain Ease®: Pentafluoropropane 95% and tetrafluoroethane 5% (103.5 mL) [available in mist spray or medium stream spray]

Gebauer's Instant Ice™ [OTC]: Pentafluoropropane 95% and tetrafluoroethane 5% (103.5 mL) [available in mist spray or stream spray]

Generic AvailableNo

Pentamidine

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(pen TAM i deen)

U.S. Brand NamesNebuPent®; Pentam-300®

Canadian Brand NamesPentamidine Isetionate for Injection

Pharmacologic CategoryAntibiotic, Miscellaneous

Use: Labeled IndicationsTreatment and prevention of pneumonia caused by *Pneumocystis carinii* (PCP)

Use: Unlabeled/InvestigationalTreatment of trypanosomiasis and visceral leishmaniasis

Dosing: Adults

Treatment of PCP pneumonia: I.M., I.V. (I.V. preferred): 4 mg/kg/day once daily for 14 days

Prevention of PCP pneumonia: Inhalation: 300 mg every 4 weeks via Respirgard® II nebulizer

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Treatment of PCP pneumonia: I.M., I.V. (I.V. preferred): Children: 4 mg/kg/day once daily for 10-14 days

Prevention of PCP pneumonia: Children:

> *I.M., I.V.:* 4 mg/kg monthly or every 2 weeks
>
> *Inhalation (aerosolized pentamidine in children ≥5 years):* 300 mg/dose given every 3-4 weeks via Respirgard® II inhaler (8 mg/kg dose has also been used in children <5 years)

Treatment of trypanosomiasis (unlabeled use): I.V.: 4 mg/kg/day once daily for 10 days

Dosing: Renal Impairment

Cl_{cr} 10-50 mL/minute: Administer dose every 24-36 hours.

Cl_{cr} <10 mL/minute: Administer dose every 48 hours.

Not removed by hemo- or peritoneal dialysis or continuous arteriovenous or venovenous hemofiltration. Supplemental dose is not necessary.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.Deep I.M.

Administration: I.V.Do not use NS as a diluent. Infuse I.V. slowly over a period of at least 60 minutes or administer deep I.M.

Administration: I.V. DetailpH: 5.4 (sterile water); 4.09-4.38 (D_5W)

Administration: InhalationDeliver until nebulizer is gone (30-45 minutes). Virtually undetectable amounts are transferred to healthcare personnel during aerosol administration.

StorageStore intact vials at controlled room temperature and protect from light. Do not refrigerate due to the possibility of crystallization. Reconstituted solutions (60-100 mg/mL) are stable for 48 hours at room temperature and do not require light protection. Diluted solutions for injection (1-2.5 mg/mL) in D_5W are stable for at least 24 hours at room temperature. The manufacturer recommends D_5W, however stability in NS has also been documented; in addition, light protection is recommended by the manufacturer, but stability has been documented without protection from light.

ReconstitutionPowder for inhalation should be reconstituted with SWFI. Powder for injection may be reconstituted with SWFI or D_5W. Precipitation may occur if products are reconstituted with NS.

CompatibilitySolutions for injection (1-2.5 mg/mL) in D_5W are stable for at least 24 hours at room temperature. The manufacturer's labeling recommends D_5W, however stability in NS has also been documented.

Y-site administration: Compatible: Diltiazem, gatifloxacin, zidovudine. **Incompatible:** Aldesleukin, cefazolin, cefoperazone, cefotaxime, cefoxitin, ceftazidime, ceftriaxone, fluconazole, foscarnet, linezolid.

ContraindicationsHypersensitivity to pentamidine isethionate or any component of the formulation (inhalation and injection)

Warnings/Precautions

Concerns related to adverse effects:

- Hypotension: Severe hypotension (some fatalities) has been observed, even after a single dose; more common with rapid I.V. administration.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Asthma: Use with caution in patients with asthma.

- Cardiovascular disease: Use with caution in patients with pre-existing cardiovascular disease; hyper-/hypotension and arrhythmia, including ventricular tachycardia have been reported.

- Diabetes: Use with caution in patients with diabetes mellitus; hyper-/hypoglycemia and pancreatic islet cell necrosis with hyperinsulinemia has been reported. Symptoms may occur months after therapy; monitor blood glucose daily on therapy and periodically thereafter.

- Hematologic disorders: Use with caution in patients with current evidence and/or prior history of hematologic disorders; anemia, leukopenia and/or thrombocytopenia have been reported.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Pancreatitis: Use with caution in patients with a history of pancreatic disease or elevated amylase/lipase levels; acute pancreatitis has been reported.

- Renal impairment: Use with caution in patients with renal impairment.

Other warnings/precautions:

- Extravasation: May cause tissue ulceration and/or necrosis. Treat symptomatically.

Geriatric ConsiderationsTen percent of acquired immunodeficiency syndrome (AIDS) cases are in the elderly and this figure is expected to increase. Pentamidine has not as yet been studied exclusively in this population. Adjust dose for renal function.
Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/contraindicated
Adverse ReactionsInjection (I); Aerosol (A)

>10%:

Cardiovascular: Chest pain (A - 10% to 23%)

Central nervous system: Fatigue (A - 50% to 70%); dizziness (A - 31% to 47%)

Dermatologic: Rash (31% to 47%)

Endocrine & metabolic: Hyperkalemia

Gastrointestinal: Anorexia (A - 50% to 70%), nausea (A - 10% to 23%)

Local: Local reactions at injection site

Renal: Increased creatinine (I - 23%)

Respiratory: Wheezing (A - 10% to 23%), dyspnea (A - 50% to 70%), cough (A - 31% to 47%), pharyngitis (10% to 23%)

1% to 10%:

Cardiovascular: Hypotension (I - 4%)

Central nervous system: Confusion/hallucinations (1% to 2%), headache (A - 1% to 5%)

Dermatologic: Rash (I - 3.3%)

Endocrine & metabolic: Hypoglycemia <25 mg/dL (I - 2.4%)

Gastrointestinal: Nausea/anorexia (I - 6%), diarrhea (A - 1% to 5%), vomiting

Hematologic: Severe leukopenia (I - 2.8%), thrombocytopenia <20,000/mm^3 (I - 1.7%), anemia (A - 1% to 5%)

Hepatic: Increased LFTs (I - 8.7%)

<1%: Hypotension <60 mm Hg systolic (I - 0.9%), tachycardia, arrhythmia, dizziness (I), fever, fatigue (I), hyperglycemia or hypoglycemia, hypocalcemia, pancreatitis, megaloblastic anemia, granulocytopenia, leukopenia, renal insufficiency, extrapulmonary pneumocystosis, irritation of the airway, pneumothorax, Jarisch-Herxheimer-like reaction, mild renal or hepatic injury

Oncology: VesicantNo
Metabolism/Transport Effects**Substrate** of CYP2C19 (major); **Inhibits** CYP2C8/9 (weak), 2C19 (weak), 2D6 (weak), 3A4 (weak)
Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Moderate): May decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Strong): May decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression or aggravate hypoglycemia).

Monitoring ParametersLiver function tests, renal function tests, blood glucose, serum potassium and calcium, ECG, blood pressure

Nursing: Physical Assessment/MonitoringAssess patient for cautious use conditions and previous allergy history. Assess potential for interactions with other pharmacological agents patient may be taking (eg, increase or decrease levels/effects of pentamidine). **I.V., I.M.:** Patients should be lying down. Blood pressure, cardiac status, and respiratory function should be monitored closely during I.V. administration or following I.M. injection. Evaluate results of laboratory tests, therapeutic response, and adverse reactions (eg, chest pain, hypotension, rash, confusion, hallucinations, hypoglycemia, dyspnea, cough). Teach patient proper use (eg, nebulizer use if self-administered), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsLiver and renal function, blood glucose, serum potassium and calcium, ECG, CBC with platelets

Patient EducationDo not take any new medication during therapy without consulting prescriber. I.V. or I.M. preparations must be given every day (if I.M. is self-administered follow exact directions for injection and disposal of syringe/needle). Inhalant drug must be prepared and used with a nebulizer exactly as directed once every 4 weeks. Frequent blood tests and blood pressure checks will be required while using this drug. PCP pneumonia may still occur despite pentamidine use. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Avoid excessive alcohol (may exacerbate adverse effects). If you have diabetes, monitor glucose levels closely and frequently. May cause hypotension (use caution when rising from sitting or lying position or when climbing stairs); or metallic taste, nausea, vomiting, or anorexia (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report chest pain or irregular heartbeat; unusual confusion or hallucinations; rash; or unusual wheezing, coughing, or respiratory difficulty. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as isethionate [preservative free]:

Pentam-300®: 300 mg

Powder for solution, for nebulization, as isethionate [preservative free]:

NebuPent®: 300 mg

Generic AvailableNo

Mechanism of ActionInterferes with RNA/DNA, phospholipids and protein synthesis, through inhibition of oxidative phosphorylation and/or interference with incorporation of nucleotides and nucleic acids into RNA and DNA, in protozoa

Pharmacodynamics/Kinetics

Absorption: I.M.: Well absorbed; Inhalation: Limited systemic absorption

Half-life elimination: Terminal: 6.4-9.4 hours; may be prolonged with severe renal impairment

Excretion: Urine (33% to 66% as unchanged drug)

Related Information

- Safe Handling of Hazardous Drugs
- USPHS / IDSA Guidelines for the Prevention of Opportunistic Infections in Persons Infected With HIV

Pharmacotherapy PearlsVirtually undetectable amounts are transferred to healthcare personnel during aerosol administration.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsPentamidine is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, mepivacaine and levonordefrin [Carbocaine® 2% with Neo-Cobefrin®]) be used with caution.

Mental Health: Effects on Mental StatusSedation and dizziness are common; may cause confusion or hallucinations

Mental Health: Effects on Psychiatric TreatmentContraindicated with ziprasidone. May cause leukopenia; use caution with clozapine and carbamazepine.

Index TermsPentamidine Isethionate

Jump To Field (Select Field Name)

Pronunciation(PEN ta starch)
U.S. Brand NamesPentaspan速
Canadian Brand NamesPentaspan速
Pharmacologic CategoryBlood Modifiers
Use: Labeled Indications**Orphan drug:** Adjunct in leukapheresis to improve harvesting and increase yield of leukocytes by centrifugal means
Dosing: Adults**Leukapheresis:** 250-700 mL to which citrate anticoagulant has been added is administered by adding to the input line of the centrifugation apparatus at a ratio of 1:8-1:13 to venous whole blood
Dosing: ElderlyRefer to adult dosing.
Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Infusion [premixed in NS]: 10% (500 mL)

Generic AvailableNo
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
International Brand NamesHAES-steril (GB, NO)

Medication Safety Issues

Sound-alike/look-alike issues:

Talacen® may be confused with Tegison®, Timoptic®, Tinactin®

International issues:

Talacen® may be confused with Talliton® which is a brand name for carvedilol in Hungary

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Duplicate therapy issues: This product contains acetaminophen, which may be a component of other combination products. Do not exceed the maximum recommended daily dose of acetaminophen.

Pronunciation(pen TAZ oh seen & a seet a MIN oh fen)
U.S. Brand NamesTalacen®
Pharmacologic CategoryAnalgesic Combination (Opioid)
Use: Labeled IndicationsRelief of mild to moderate pain
Use: DentalRelief of mild to moderate pain
Dosing: Adults**Analgesic:** Oral: 1 caplet every 4 hours (maximum: 6 caplets/day)
Dosing: ElderlyRefer to adult dosing. Use with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.
StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).
RestrictionsC-IV
ContraindicationsHypersensitivity to pentazocine, acetaminophen, or any component of the formulation
Allergy Considerations

- Acetaminophen Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hepatotoxicity: May cause severe hepatic toxicity on acute overdose; in addition, chronic daily dosing in adults has resulted in liver damage in some patients.

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Biliary tract impairment: Use with caution in patients with biliary tract dysfunction; acute pancreatitis may cause constriction of sphincter of Oddi.
- CNS depression/coma: Use with caution in patients with CNS depression or coma.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Ethanol use: Use with caution in patients with alcoholic liver disease; consuming ≥3 alcoholic drinks/day may increase the risk of liver damage.
- G6PD deficiency: Use with caution in patients with known G6PD deficiency.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.
- Hepatic impairment: Use with caution in patients with hepatic dysfunction.
- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.
- Renal impairment: Use with caution in patients with renal dysfunction.

- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages.

- Seizures: Use with caution in patients with a history of seizure disorders.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.

Dosage form specific issues:

- Sodium metabisulfite: May contain sodium metabisulfite; may cause allergic-type reactions

Other warnings/precautions:

- Dosage limit: Limit acetaminophen dose to <4 g/day.

- Withdrawal: Concurrent use of agonist/antagonist analgesics may precipitate withdrawal symptoms and/or reduced analgesic efficacy in patients following prolonged therapy with mu opioid agonists. Abrupt discontinuation following prolonged use may also lead to withdrawal symptoms; taper dose to decrease risk of withdrawal symptoms.

Pregnancy Risk FactorC/D (prolonged use or high doses at term)
Pregnancy ConsiderationsPentazocine was not found to be teratogenic in animal studies. Pentazocine and acetaminophen cross the placenta in humans. Use should be avoided during labor and delivery of premature infants. Abstinence syndromes in the newborn have been reported after long-term use of pentazocine during pregnancy. Other adverse effects in the newborn have been reported following abuse of pentazocine during pregnancy; these effects may be due to pentazocine, other drugs abused, the mother's lifestyle, or a combination of all factors.
LactationExcretion in breast milk unknown/use caution
Breast-Feeding ConsiderationsExcretion of pentazocine in breast milk is unknown; acetaminophen is excreted in breast milk
Adverse ReactionsAdverse reactions attributed to pentazocine 50 mg. Frequency not defined.

Cardiovascular: Flushing, hypotension, syncope, tachycardia

Central nervous system: Chills, confusion, depression, disorientation, dizziness, drowsiness, euphoria, excitement, hallucinations, headache, insomnia, irritability, lightheadedness, sedation

Dermatologic: Erythema multiforme, rash, Stevens-Johnson syndrome, toxic epidermal necrolysis, urticaria

Gastrointestinal: Abdominal distress, anorexia, biliary spasm, constipation, diarrhea, nausea, vomiting

Genitourinary: Urinary retention

Hematologic: Agranulocytosis, eosinophilia, hemolytic anemia, thrombocytopenic purpura, WBCs decreased

Neuromuscular & skeletal: Paresthesia, tremor, weakness

Ocular: Blurred vision

Otic: Tinnitus

Respiratory: Respiratory depression

Miscellaneous: Anaphylaxis, diaphoresis, facial edema

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Cholestyramine Resin: May decrease the absorption of Acetaminophen. Effect is minimal if cholestyramine is administered 1 hour after acetaminophen. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Imatinib: May increase the serum concentration of Acetaminophen. *Risk D: Consider therapy modification*

Isoniazid: May enhance the adverse/toxic effect of Acetaminophen. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Acetaminophen may enhance the anticoagulant effect of Vitamin K Antagonists. Most likely with daily acetaminophen doses >1.3 g for >1 week. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Caplet:

Talacen®: Pentazocine 25 mg and acetaminophen 650 mg [contains sodium metabisulfite]

Tablet: Pentazocine 25 mg and acetaminophen 650 mg

Generic AvailableYes
ManufacturerSanofi-Aventis U.S. LLC
Pricing: U.S. (www.drugstore.com)

Tablets (Pentazocine-APAP)

25-650 mg (30): $39.99

Mechanism of Action

Pentazocine: Binds to opiate receptors in the CNS, causing inhibition of ascending pain pathways, altering the perception of and response to pain; produces generalized CNS depression; partial agonist-antagonist

Acetaminophen: Inhibits the synthesis of prostaglandins in the central nervous system and peripherally blocks pain impulse generation

Pharmacodynamics/KineticsSee individual agents.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Index TermsAcetaminophen and Pentazocine; Pentazocine Hydrochloride and Acetaminophen

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(pen TAZ oh seen)

U.S. Brand NamesTalwin®; Talwin® Nx

Canadian Brand NamesTalwin®

Pharmacologic CategoryAnalgesic, Opioid

Use: Labeled Indications

Talwin®: Relief of moderate-to-severe pain; has also been used as a sedative prior to surgery and as a supplement to surgical anesthesia

Talwin® Nx: Relief of moderate-to-severe pain; indicated for oral use only

Dosing: Adults**Analgesic:**

Oral: 50 mg every 3-4 hours; may increase to 100 mg/dose if needed, but should not exceed 600 mg/day (maximum: 12 tablets/day)

I.M., SubQ: 30-60 mg every 3-4 hours; do **not** exceed 60 mg/dose (maximum: 360 mg/day)

I.V.: 30 mg every 3-4 hours; do **not** exceed 30 mg/dose (maximum: 360 mg/day)

Dosing: ElderlyUse with caution; may be more sensitive to analgesic and sedative effects; decrease initial dose and monitor closely

Dosing: Pediatric

Analgesia:

I.M.: Children:

5-8 years: 15 mg

8-14 years: 30 mg

Oral: Children >12 years: Refer to adult dosing.

Preoperative/preanesthetic: Children 1-16 years: I.M.: 0.5 mg/kg

Dosing: Renal Impairment

Cl_{cr} 10-50 mL/minute: Administer 75% of normal dose.

Cl_{cr} <10 mL/minute: Administer 50% of normal dose.

Dosing: Hepatic ImpairmentReduce dose or avoid use in patients with liver disease.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics
- Opioid Agonist Conversion

Administration: I.M.Rotate injection site; avoid intra-arterial injection

Administration: I.V. DetailpH: 4-5 (adjusted with lactic acid or sodium hydroxide)

Administration: OtherRotate injection site; avoid SubQ use unless absolutely necessary (may cause tissue damage); avoid intra-arterial injection

Storage

Injection: Store at 20°C to 25°C (68°F to 77°F); do not freeze. Protect from heat.

Tablet: Store at 25°C (77°F); excursions permitted between 15°C to 30°C (59°F to 86°F).

Compatibility

Y-site administration: Compatible: Heparin, hydrocortisone sodium succinate, potassium chloride, vitamin B complex with C. **Incompatible:** Nafcillin.

Compatibility in syringe: Compatible: Atropine, butorphanol, chlorpromazine, cimetidine, dimenhydrinate, diphenhydramine, droperidol, fentanyl, hydromorphone, hydroxyzine, meperidine, meperidine with perphenazine, metoclopramide, morphine, perphenazine, prochlorperazine edisylate, promazine, promethazine, propiomazine, ranitidine, scopolamine. **Incompatible:** Glycopyrrolate, heparin, pentobarbital.

Compatibility when admixed: Incompatible: Aminophylline, amobarbital, pentobarbital, phenobarbital, sodium bicarbonate.

RestrictionsC-IV

ContraindicationsHypersensitivity to pentazocine, naloxone, or any component of the formulation

Allergy Considerations

- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Talwin® Nx: See "Dosage form specific issues" below.

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Injection-site reactions: Severe sclerosis has occurred at the injection-site following multiple injections; avoid SubQ use unless absolutely necessary; rotate sites of injection.
- Hypotension: May cause hypotension; use with caution in patients with hypovolemia, cardiovascular disease (including acute MI), or drugs which may exaggerate hypotensive effects (including phenothiazines or general anesthetics).

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.
- Biliary tract impairment: Use with caution in patients with biliary tract dysfunction; acute pancreatitis may cause constriction of sphincter of Oddi.
- CNS depression/coma: Use with caution in patients with CNS depression or coma.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Ethanol use: Use with caution due to the potential for increased risk of CNS depressant effects.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.
- Hepatic impairment: Use with caution in patients with hepatic dysfunction.
- Obesity: Use with caution in patients who are morbidly obese.
- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.
- Renal impairment: Use with caution in patients with renal dysfunction.
- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages.
- Seizures: Use with caution in patients with a history of seizure disorders.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.
- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.
- Pediatrics: Safety and efficacy have not been established in children <1 year of age (Talwin®) and <12 years of age (Talwin® Nx).

Dosage form specific issues:

- Sulfites: Injection may contain sulfites which may cause allergic reaction.
- Talwin® Nx: **[U.S. Boxed Warning]: Talwin® Nx is intended for oral administration only - severe vascular reactions have resulted from misuse by injection.**

Other warnings/precautions:

- Withdrawal: Concurrent use of agonist/antagonist analgesics may precipitate withdrawal symptoms and/or reduced analgesic efficacy in patients following prolonged therapy with mu opioid agonists. Abrupt discontinuation following prolonged use may also lead to withdrawal symptoms; taper dose to decrease risk of withdrawal symptoms.

Geriatric ConsiderationsPentazocine is not recommended for use in the elderly because of its propensity to cause delirium and agitation. If pentazocine must be used, be sure to adjust dose for renal function.

Pregnancy Risk FactorC/D (prolonged use or high doses at term)

Pregnancy ConsiderationsPentazocine was not found to be teratogenic in animal studies. Pentazocine and naloxone have been shown to cross the human placenta. Use should be avoided during labor and delivery of premature infants. Abstinence syndromes in the newborn have been reported after long-term use of pentazocine during pregnancy. Other adverse effects in the newborn have been reported following abuse of pentazocine during pregnancy; these effects may be due to pentazocine, other drugs abused, the mother's lifestyle, or a combination of all factors.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsExcretion of pentazocine in breast milk is unknown; no data available for naloxone

Adverse ReactionsFrequency not defined.

Cardiovascular: Circulatory depression, facial edema, flushing, hypotension, shock, syncope, tachycardia

Central nervous system: Chills, CNS depression, confusion, disorientation, dizziness, drowsiness, euphoria, excitement, hallucinations, headache, insomnia, irritability, lightheadedness, malaise, nightmares, sedation

Dermatologic: Dermatitis, erythema multiforme, pruritus, rash, Stevens-Johnson syndrome, toxic epidermal necrolysis, urticaria

Gastrointestinal: Abdominal distress, anorexia, constipation, diarrhea, nausea, vomiting, xerostomia

Genitourinary: Urinary retention

Hematologic: Decreased WBCs, eosinophilia

Local: Tissue damage and irritation with I.M./SubQ use

Neuromuscular & skeletal: Paresthesia, tremor, weakness

Ocular: Blurred vision, miosis

Otic: Tinnitus

Respiratory: Dyspnea, respiratory depression (rare)

Miscellaneous: Anaphylaxis, diaphoresis, physical and psychological dependence

Oncology: VesicantLocal effects (stinging, induration, ulceration, thrombosis) have been associated with chronic use of pentazocine. I.M. injections are reported to cause less local tissue damage than SubQ injections.

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Monitoring ParametersRelief of pain, respiratory and mental status, blood pressure

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for additive or adverse interactions. Monitor therapeutic effectiveness, adverse reactions, and overdose at beginning of therapy and at regular intervals with long-term use. May cause physical and/or psychological dependence. For inpatients, implement safety measures. Assess knowledge/teach patient appropriate use (if self-administered), adverse reactions to report and appropriate interventions to reduce side effects..

Patient EducationIf self-administered, use exactly as directed; do not increase dose or frequency. Drug may cause physical and/or psychological dependence. While using this medication, do not use alcohol and other prescription or OTC medications (especially sedatives, tranquilizers, antihistamines, or pain medications) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause hypotension, dizziness, drowsiness, impaired coordination, or blurred vision (use caution when driving, climbing stairs, or changing position - rising from sitting or lying to standing, or when engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, loss of appetite, or dry mouth (frequent mouth care, small frequent meals, chewing gum, or sucking lozenges may help); or constipation (increased exercise, fluids, fruit, or fiber may help; if unresolved, consult prescriber about use of stool softeners). Report persistent dizziness or headache; excessive fatigue or sedation; changes in mental status; changes in urinary elimination or pain on urination; weakness or trembling; blurred vision; or shortness of breath. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Talwin®: 30 mg/mL (1 mL, 10 mL) [10 mL size contains sodium bisulfite]

Tablet: Pentazocine 50 mg and naloxone 0.5 mg

Talwin® Nx: Pentazocine 50 mg and naloxone 0.5 mg

Generic AvailableYes: Tablet

Pricing: U.S. (www.drugstore.com)

Solution (Talwin)

30 mg/mL (10): $74.42

Tablets (Pentazocine-Naloxone HCl)

50-0.5 mg (30): $40.22

Tablets (Talwin NX)

50-0.5 mg (30): $65.09

Mechanism of Action

Pentazocine: Binds to opiate receptors in the CNS, causing inhibition of ascending pain pathways, altering the perception of and response to pain; produces generalized CNS depression; partial agonist-antagonist

Naloxone: Pure opioid antagonist that competes for and displaces narcotics at opioid receptor sites in CNS

Pharmacodynamics/Kinetics

Onset of action: Oral, I.M., SubQ: 15-20 minutes; I.V.: 2-3 minutes

Duration: Oral: 4-5 hours; Parenteral: 2-3 hours

Protein binding: 60%

Metabolism: Hepatic via oxidative and glucuronide conjugation pathways; extensive first-pass effect

Bioavailability: Oral: ~20%; increased to 60% to 70% with cirrhosis

Half-life elimination: 2-3 hours; prolonged with hepatic impairment

Excretion: Urine (small amounts as unchanged drug)

Related Information

- Depression
- Narcotic / Opioid Analgesics

Pharmacotherapy PearlsTalwin® Nx: If tablet misused as an injection, the naloxone component will prevent the effect of pentazocine.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness and euphoria are common; may cause restlessness or nightmares; may rarely cause confusion, depression, or hallucinations

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive effects or toxicity; may cause withdrawal in patients currently dependent on narcotics

Index TermsNaloxone Hydrochloride and Pentazocine Hydrochloride; Pentazocine Hydrochloride; Pentazocine Hydrochloride and Naloxone Hydrochloride; Pentazocine Lactate

Pronunciation(pen toe BAR bi tal)

U.S. Brand NamesNembutal®

Canadian Brand NamesNembutal® Sodium

Pharmacologic CategoryAnticonvulsant, Barbiturate; Barbiturate

Use: Labeled IndicationsSedative/hypnotic; preanesthetic; high-dose barbiturate coma for treatment of increased intracranial pressure or status epilepticus unresponsive to other therapy

Dosing: Adults

Hypnotic:

I.M.: 150-200 mg

I.V.: Initial: 100 mg, may repeat every 1-3 minutes up to 200-500 mg total dose

Preoperative sedation: I.M.: 150-200 mg

Barbiturate coma in head injury patients or status epilepticus: I.V.: Loading dose: 5-10 mg/kg given slowly over 1-2 hours; monitor blood pressure and respiratory rate; maintenance infusion: initial: 1 mg/kg/hour; may increase to 2-3 mg/kg/hour; maintain burst suppression on EEG

Status epilepticus: I.V.: Loading dose: 10-20 mg/kg given slowly over 1-2 hours; maintenance infusion: 0.5-3 mg/kg/hour. **Note**: Intubation required; monitor hemodynamics

Dosing: ElderlyNot recommended for use in the elderly (see Geriatric Considerations).

Dosing: Pediatric

Hypnotic: I.M.: 2-6 mg/kg; maximum: 100 mg/dose

Preoperative/preprocedure sedation: ≥6 months:

Note: Limited information is available for infants <6 months of age.

I.M.: 2-6 mg/kg; maximum: 100 mg/dose

I.V.: 1-3 mg/kg to a maximum of 100 mg until asleep

Conscious sedation prior to a procedure: I.V.:

Children 5-12 years: I.V.: 2 mg/kg 5-10 minutes before procedures, may repeat one time

Adolescents: 100 mg prior to a procedure

Barbiturate coma in head injury patients: I.V.: Loading dose: 5-10 mg/kg given slowly over 1-2 hours; monitor blood pressure and respiratory rate; Maintenance infusion: Initial: 1 mg/kg/hour; may increase to 2-3 mg/kg/hour; maintain burst suppression on EEG

Status epilepticus: I.V.: **Note**: Intubation required; monitor hemodynamics: Loading dose: 5-15 mg/kg given slowly over 1-2 hours; maintenance infusion: 0.5-5 mg/kg/hour

Dosing: Hepatic ImpairmentReduce dosage in patients with severe liver dysfunction.

Administration: I.M.Pentobarbital may be administered by deep I.M.: No more than 5 mL (250 mg) should be injected at any one site because of possible tissue irritation.

Administration: I.V.Pentobarbital must be administered by slow I.V. injection. I.V. push doses can be given undiluted, but should be administered no faster than 50 mg/minute. Avoid intra-arterial injection. Has many incompatibilities when given I.V.

Administration: I.V. DetailAvoid extravasation. Institute safety measures to avoid injuries. Parenteral solutions are highly alkaline. Avoid rapid I.V. administration >50 mg/minute.

pH: 9.5

StorageProtect from freezing. Aqueous solutions are not stable; a commercially available vehicle (containing propylene glycol) is more stable. When mixed with an acidic solution, precipitate may form. Use only clear solution.

CompatibilityStable in dextran 6% in dextrose, dextran 6% in NS, D_5LR, $D_5{}^1/_4$NS, $D_5{}^1/_2$NS, D_5NS, D_{10}W, LR, $^1/_2$NS; **variable stability (consult detailed reference)** in D_5W, NS.

Y-site administration: Compatible: Acyclovir, gatifloxacin, insulin (regular), linezolid, propofol. **Incompatible:** Amphotericin B cholesteryl sulfate complex.

Compatibility in syringe: Compatible: Aminophylline, ephedrine, hyaluronidase, hydromorphone, neostigmine, scopolamine, sodium bicarbonate, thiopental. **Incompatible:** Atropine with cimetidine, butorphanol, chlorpromazine, cimetidine, dimenhydrinate, diphenhydramine, droperidol, fentanyl, glycopyrrolate, hydroxyzine, meperidine, midazolam, nalbuphine, pentazocine, perphenazine, prochlorperazine edisylate, promazine, promethazine, ranitidine. **Variable (consult detailed reference):** Atropine, morphine.

Compatibility when admixed: Compatible: Amikacin, aminophylline, calcium chloride, chloramphenicol, dimenhydrinate, erythromycin lactobionate, lidocaine, thiopental, verapamil. **Incompatible:** Cefazolin, chlorpheniramine, cimetidine, clindamycin, droperidol, ephedrine, fentanyl, hydrocortisone sodium succinate, hydroxyzine, insulin (regular), levorphanol, norepinephrine, pancuronium, penicillin G potassium, pentazocine, phenytoin, promazine, promethazine, streptomycin, triflupromazine, vancomycin. **Variable (consult detailed reference):** Chlorpromazine, isoproterenol, metaraminol, methyldopate, norepinephrine, sodium bicarbonate, succinylcholine.

RestrictionsC-II

ContraindicationsHypersensitivity to barbiturates or any component of the formulation; marked hepatic impairment; dyspnea or airway obstruction; porphyria; pregnancy

Allergy Considerations

- Aromatic Anticonvulsant Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hypotension: May cause hypotension particularly when administered intravenously; use with caution in hemodynamically unstable patients (hypotension or shock). High doses (loading doses of 15-35 mg/kg given over 1-2 hours) have been utilized to induce pentobarbital coma, but these higher doses often cause hypotension requiring vasopressor therapy.
- Paradoxical stimulatory response: May cause paradoxical responses, including agitation and hyperactivity, particularly in acute pain and pediatric patients.
- Respiratory depression: May cause respiratory depression particularly when administered intravenously; use with caution patients with respiratory disease.

Disease-related concerns:

- Depression: Use with caution in patients with depression or suicidal tendencies.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment.
- Substance abuse: Use with caution in patients with a history of drug abuse; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.

Concurrent drug therapy issues:

- Sedatives: Effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Debilitated patients: Use with caution in patients who are debilitated.
- Elderly: Use with caution in the elderly; use of this agent as a hypnotic in the elderly is not recommended due to its long half-life and potential for physical and psychological dependence.
- Pediatrics: Use with caution in children.

Other warnings/precautions:

- Acute pain: Do not administer to patients in acute pain.
- Insomnia use: Tolerance to hypnotic effect can occur; do not use for >2 weeks to treat insomnia.
- Withdrawal: Anticonvulsants should not be discontinued abruptly because of the possibility of increasing seizure frequency; therapy should be withdrawn gradually to minimize the potential of increased seizure frequency, unless safety concerns require a more rapid withdrawal.

Geriatric ConsiderationsUse of this agent as a hypnotic in the elderly is not recommended due to its long half-life and addiction potential.

Pregnancy Risk FactorD

LactationEnters breast milk/contraindicated

Adverse ReactionsFrequency not defined.

Cardiovascular: Bradycardia, hypotension, syncope

Central nervous system: Drowsiness, lethargy, CNS excitation or depression, impaired judgment, “hangover” effect, confusion, somnolence, agitation, hyperkinesia, ataxia, nervousness, headache, insomnia, nightmares, hallucinations, anxiety, dizziness

Dermatologic: Rash, exfoliative dermatitis, Stevens-Johnson syndrome

Gastrointestinal: Nausea, vomiting, constipation

Hematologic: Agranulocytosis, thrombocytopenia, megaloblastic anemia

Local: Pain at injection site, thrombophlebitis with I.V. use

Renal: Oliguria

Respiratory: Laryngospasm, respiratory depression, apnea (especially with rapid I.V. use), hypoventilation

Miscellaneous: Gangrene with inadvertent intra-arterial injection

Metabolism/Transport Effects **Induces** CYP2A6 (strong), 3A4 (strong)

Drug Interactions

Acetaminophen: Barbiturates may increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Beta-Blockers: Barbiturates may decrease the serum concentration of Beta-Blockers. **Exceptions:** Atenolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

Calcium Channel Blockers: Barbiturates may increase the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

Carbonic Anhydrase Inhibitors: May enhance the adverse/toxic effect of Anticonvulsants (Barbiturate). Specifically, osteomalacia and rickets. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

Chloramphenicol: May decrease the metabolism of Barbiturates. Barbiturates may increase the metabolism of Chloramphenicol. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Contraceptive (Progestins): Barbiturates may diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Barbiturates may increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CycloSPORINE: Barbiturates may increase the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

CYP2A6 Substrates: CYP2A6 Inducers (Strong) may increase the metabolism of CYP2A6 Substrates. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inducers (Strong) may increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Disopyramide: Barbiturates may increase the metabolism of Disopyramide. *Risk D: Consider therapy modification*

Doxycycline: Barbiturates may decrease the serum concentration of Doxycycline. *Risk D: Consider therapy modification*

Etoposide: Barbiturates may increase the metabolism of Etoposide. *Risk C: Monitor therapy*

Etoposide Phosphate: Barbiturates may decrease the serum concentration of Etoposide Phosphate. Barbiturates may increase the metabolism, via CYP isoenzymes, of etoposide phosphate. *Risk C: Monitor therapy*

Felbamate: May increase the serum concentration of Barbiturates. *Risk C: Monitor therapy*

Griseofulvin: Barbiturates may decrease the absorption of Griseofulvin. *Risk D: Consider therapy modification*

Ketorolac: May diminish the therapeutic effect of Anticonvulsants. *Risk C: Monitor therapy*

LamoTRIgine: Barbiturates may increase the metabolism of LamoTRIgine. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Mefloquine: May diminish the therapeutic effect of Anticonvulsants. Mefloquine may decrease the serum concentration of Anticonvulsants. Management: Mefloquine is contraindicated in persons with a history of convulsions. If anticonvulsant is being used for another indication monitor response to treatment closely, as concurrent mefloquine may decrease response to treatment. *Risk D: Consider therapy modification*

Meperidine: Barbiturates may enhance the CNS depressant effect of Meperidine. *Risk C: Monitor therapy*

Methadone: Barbiturates may increase the metabolism of Methadone. *Risk D: Consider therapy modification*

Nilotinib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nilotinib. *Risk X: Avoid combination*

Oral Contraceptive (Estrogens): Barbiturates may diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Primidone: May enhance the adverse/toxic effect of Barbiturates. Primidone is converted to phenobarbital, and thus becomes additive with existing barbiturate therapy. *Risk C: Monitor therapy*

Propafenone: Barbiturates may increase the metabolism of Propafenone. *Risk D: Consider therapy modification*

Pyridoxine: May increase the metabolism of Barbiturates. Apparent in high pyridoxine doses (eg, 200 mg/day) *Risk C: Monitor therapy*

QuiNIDine: Barbiturates may increase the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Ranolazine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Ranolazine. *Risk X: Avoid combination*

Rifamycin Derivatives: May increase the metabolism of Barbiturates. *Risk C: Monitor therapy*

Sorafenib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Sorafenib. *Risk D: Consider therapy modification*

Teniposide: Barbiturates may increase the metabolism of Teniposide. *Risk C: Monitor therapy*

Theophylline Derivatives: Barbiturates may increase the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Tricyclic Antidepressants: Barbiturates may increase the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Valproic Acid: May decrease the metabolism of Barbiturates. Barbiturates may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Barbiturates may increase the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).

Monitoring ParametersRespiratory status (for conscious sedation, includes pulse oximetry), cardiovascular status, CNS status; cardiac monitor and blood pressure monitor required

Reference Range

Therapeutic:

Hypnotic: 1-5 mcg/mL (SI: 4-22 µmol/L)

Coma: 10-50 mcg/mL (SI: 88-221 µmol/L)

Toxic: >10 mcg/mL (SI: >44 µmol/L)

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Assess for history of addiction; long-term use can result in dependence, abuse, or tolerance. Periodically evaluate the need for continued use. **I.V.:** Keep patient under observation. Monitor cardio/respiratory status and institute patient safety precautions. Monitor effectiveness of therapy and adverse reactions.

Patient EducationPatient instructions and information are determined by patient condition and therapeutic purpose. Drug may cause physical and/or psychological dependence. While using this medication, do not use alcohol and other prescription or OTC medications (especially pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, or loss of appetite (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or constipation (increased exercise, fluids, fruit, or fiber may help). Report skin rash or irritation; CNS changes (confusion, depression, increased sedation, excitation, headache, insomnia, or nightmares); respiratory difficulty or shortness of breath; changes in urinary pattern or menstrual pattern; muscle weakness or tremors; or difficulty swallowing or feeling of tightness in throat. **Pregnancy/breast-feeding precautions:** Do not get pregnant; use appropriate contraceptive measures to prevent possible harm to the fetus. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as sodium: 50 mg/mL (20 mL, 50 mL) [contains alcohol 10% and propylene glycol 40%]

Generic AvailableNo

ManufacturerOvation Pharmaceuticals

Mechanism of ActionShort-acting barbiturate with sedative, hypnotic, and anticonvulsant properties. Barbiturates depress the sensory cortex, decrease motor activity, alter cerebellar function, and produce drowsiness, sedation, and hypnosis. In high doses, barbiturates exhibit anticonvulsant activity; barbiturates produce dose-dependent respiratory depression.

Pharmacodynamics/Kinetics

Onset of action: I.M.: 10-15 minutes; I.V.: ~1 minute

Duration: I.V.: 15 minutes

Distribution: V_d: Children: 0.8 L/kg; Adults: 1 L/kg

Protein binding: 35% to 55%

Metabolism: Extensively hepatic via hydroxylation and oxidation pathways

Half-life elimination: Terminal: Children: 25 hours; Adults: Healthy: 22 hours (range: 15-50 hours)

Excretion: Urine (<1% as unchanged drug)

Related Information

- Status Epilepticus

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Anesthesia and Critical Care Concerns/Other Considerations Pentobarbital 50 mg/mL contains propylene glycol 414.4 mg/mL (40% v/v).

Pentobarbital is one of the standard choices for refractory status epilepticus. Most patients will require systemic and pulmonary arterial catheterization with fluid and vasoactive therapy to maintain blood pressure. High-dose pentobarbital generally produces poikilothermia. Maintenance anticonvulsant treatment may be substantial in order to wean pentobarbital. High doses of barbiturates are potentially immunosuppressive; guard against infection.

Index Terms Pentobarbital Sodium

International Brand Names Dormital (UY); Mebumal (DK); Medinox Mono (DE); Nembutal (AT); Pentone (AU); Praecicalm (DE); Prodormol (IL); Sombutol (FI); Sopental (ZA)

Medication Safety Issues

Sound-alike/look-alike issues:

Pentosan may be confused with pentostatin

Elmiron® may be confused with Imuran®

Pronunciation(PEN toe san pol i SUL fate SOW dee um)
U.S. Brand NamesElmiron®
Canadian Brand NamesElmiron®
Pharmacologic CategoryAnalgesic, Urinary
Use: Labeled Indications**Orphan drug:** Relief of bladder pain or discomfort due to interstitial cystitis
Dosing: Adults**Interstitial cystitis:** Oral: 100 mg 3 times/day taken with water 1 hour before or 2 hours after meals

Note: Patients should be evaluated at 3 months and may be continued an additional 3 months if there has been no improvement and if there are no therapy-limiting side effects. **The risks and benefits of continued use beyond 6 months in patients who have not responded is not yet known**.

Dosing: ElderlyRefer to adult dosing.
Administration: OralShould be administered with water 1 hour before or 2 hours after meals.
StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F).
ContraindicationsHypersensitivity to pentosan polysulfate sodium, related compounds (LMWHs or heparin), or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Bleeding: Pentosan polysulfate is a low-molecular weight heparin-like compound with anticoagulant and fibrinolytic effects, therefore, bleeding complications such as ecchymosis, epistaxis and gum bleeding, may occur. Patients undergoing invasive procedures or having signs or symptoms of underlying coagulopathies or other increased risk of bleeding (eg, receiving heparin, warfarin, thrombolytics, NSAIDs, or high dose aspirin) should be evaluated prior to use.

Disease-related concerns:

- Aneurysm: Carefully evaluate patients with aneurysm before initiating therapy.

- Bleeding disorders: Carefully evaluate patients with hemophilia and/or thrombocytopenia before initiating therapy.

- Gastrointestinal disease: Carefully evaluate patients with gastrointestinal ulcerations, polyps, and/or diverticula before initiating therapy.

- Heparin-induced thrombocytopenia: Use with caution in patients with a history of heparin-induced thrombocytopenia.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <16 years of age.

Pregnancy Risk FactorB
Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Use with caution and only if clearly needed during pregnancy. Based on limited data, pentosanpolysulfate does not appear to cross the placenta.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

1% to 10%:

Central nervous system: Headache (3%), dizziness (1%)

Dermatologic: Alopecia (4%), rash (3%)

Gastrointestinal: Rectal hemorrhage (6%), diarrhea (4%), nausea (4%), dyspepsia (2%), abdominal pain (2%)

Hepatic: Liver function test abnormalities (1%)

<1%: Allergic reactions, amblyopia, anemia, anorexia, colitis, conjunctivitis, constipation, depression, dyspnea, ecchymosis, epistaxis, esophagitis, flatulence, gastritis, gum bleeding, hyperkinesia, increased partial thromboplastin time, insomnia, leukopenia, mouth ulcer,

nystagmus, optic neuritis, pharyngitis, photosensitivity, prolonged PT, pruritus, retinal hemorrhage, rhinitis, thrombocytopenia, tinnitus, urticaria, vaginitis

Drug Interactions

Anticoagulants: Pentosan Polysulfate Sodium may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: Pentosan Polysulfate Sodium may enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 100 mg

Generic Available No

Pricing: U.S. (www.drugstore.com)

Capsules (Elmiron)

100 mg (90): $281.38

Mechanism of Action Although pentosan polysulfate sodium is a low-molecular weight heparinoid, it is not known whether these properties play a role in its mechanism of action in treating interstitial cystitis; the drug appears to adhere to the bladder wall mucosa where it may act as a buffer to protect the tissues from irritating substances in the urine.

Pharmacodynamics/Kinetics

Absorption: ~3%

Metabolism: Hepatic and via spleen; some metabolism occurs in renal parenchyma

Half-life elimination: 4.8 hours

Excretion: Urine (3% as unchanged drug)

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause dizziness

Mental Health: Effects on Psychiatric Treatment May cause anemia and leukopenia; use caution with clozapine and carbamazepine

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Pentostatin may be confused with pentamidine, pentosan

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

International issues:

Nipent® may be confused with Nipin® which is a brand name for nifedipine in Italy and Singapore

Pronunciation(pen toe STAT in)

U.S. Brand NamesNipent®

Canadian Brand NamesNipent®

Pharmacologic CategoryAntineoplastic Agent, Antibiotic; Antineoplastic Agent, Antimetabolite (Purine Antagonist)

Use: Labeled IndicationsTreatment of hairy cell leukemia

Use: Unlabeled/InvestigationalTreatment of cutaneous T-cell lymphoma, chronic lymphocytic leukemia (CLL), and acute and chronic graft-versus-host-disease (GVHD)

Dosing: AdultsRefer to individual protocols.

Hairy cell leukemia: I.V.: 4 mg/m^2 every 2 weeks

CLL (unlabeled use): I.V.: 4 mg/m^2 weekly for 3 weeks, then every 2 weeks

Cutaneous T-cell lymphoma (unlabeled use): I.V.: 3.75-5 mg/m^2 daily for 3 days every 3 weeks

Acute GVHD (unlabeled use): I.V.: 1.5 mg/m^2 daily for 3 days; may repeat after 2 weeks if needed

Chronic GVHD (unlabeled use): I.V.: 4 mg/m^2 every 2 weeks for 12 doses; then 4 mg/m^2 every 3-4 weeks (if still improving)

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentThe FDA-approved labeling does not contain renal dosage adjustment guidelines; use with caution in patients with Cl_{cr} <60 mL/minute. Two patients with Cl_{cr} 50-60 mL/minute achieved responses when treated with 2 mg/m^2/dose. The following guidelines have been used by some clinicians:

Kintzel, 1995:

Cl_{cr} 46-60 mL/minute: Administer 70% of dose

Cl_{cr} 31-45 mL/minute: Administer 60% of dose

Cl_{cr} <30 mL/minute: Consider use of alternative drug

Lathia, 2002:

Cl_{cr} 40-59 mL/minute: Administer 3 mg/m^2/dose

Cl_{cr} 20-39 mL/minute: Administer 2 mg/m^2/dose

Dosing: Combination Regimens

Leukemia, chronic lymphocytic:

PCR

Pentostatin-Cyclophosphamide

Calculations

- Body Surface Area: Adults

- Creatinine Clearance: Adults

Administration: I.V.Administer I.V. 20- to 30-minute infusion or I.V. bolus over 5 minutes. Hydrate with 500-1000 mL fluid prior to infusion and 500 mL after infusion.

Administration: I.V. DetailpH: 7.0-8.5

StorageStore intact vials under refrigeration at 2°C to 8°C (36°F to 46°F); reconstituted vials, or further dilutions, are stable at room temperature for 8 hours in D_5W or 48 hours in NS.

ReconstitutionReconstitute with 5 mL SWFI to a concentration of 2 mg/mL. The solution may be further diluted in 25-50 mL NS or D_5W for infusion.

CompatibilityStable in LR, NS; **variable stability (consult detailed reference)** in D_5W.

Y-site administration: Compatible: Fludarabine, melphalan, ondansetron, paclitaxel, sargramostim.

ContraindicationsHypersensitivity to pentostatin or any component of the formulation

Warnings/Precautions

Boxed warnings:

- CNS toxicity: See “Concerns related to adverse effects” below.
- Experienced physician: See “Other warnings/precautions” below.
- Hepatotoxicity: See “Concerns related to adverse effects” below.
- Pulmonary toxicity: See “Concerns related to adverse effects” below.
- Renal toxicity: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: May occur, primarily early in treatment; if neutropenia persists beyond early cycles, evaluate for disease status.
- CNS toxicity: **[U.S. Boxed Warnings]: Severe CNS toxicities have occurred with doses higher than recommended; do not exceed the recommended dose.** Withhold treatment for CNS toxicity.
- Hepatotoxicity: **[U.S. Boxed Warnings]: Severe liver toxicities have occurred with doses higher than recommended; do not exceed the recommended dose.** May cause elevations (reversible) in liver function tests.
- Pulmonary toxicity: **[U.S. Boxed Warnings]: Severe pulmonary toxicities have occurred with doses higher than recommended; do not exceed the recommended dose. Do not administer concurrently with fludarabine; concomitant use has resulted in serious or fatal pulmonary toxicity.**
- Rash: Severe rashes may occur and worsen with therapy continuation; may require withholding of treatment or discontinuation.
- Renal toxicity: **[U.S. Boxed Warnings]: Severe renal toxicities have occurred with doses higher than recommended; do not exceed the recommended dose.**

Disease-related concerns:

- Infections: In patients who present with infections prior to treatment, infections should be resolved, if possible, prior to initiation of treatment. Treatment should be temporarily withheld for active infections during therapy.
- Renal impairment: Use with caution in patients with renal dysfunction (Cl_{cr} <60 mL/minute); the terminal half-life is prolonged; appropriate dosing guidelines in renal insufficiency have not been determined.

Concurrent drug therapy issues:

- Carmustine/etoposide/cyclophosphamide: Fatal pulmonary edema and hypotension have been reported in patients treated with pentostatin in combination with carmustine, etoposide, or high-dose cyclophosphamide as part of a myeloablative regimen for bone marrow transplant.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

Pregnancy Risk FactorD

Pregnancy ConsiderationsAnimal studies have demonstrated teratogenicity, maternal toxicity, and fetal loss. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should be advised to avoid becoming pregnant.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in nursing the infant, breast-feeding is not recommended.

Adverse Reactions

>10%:

Central nervous system: Fever (42% to 46%), fatigue (29% to 42%), pain (8% to 20%), chills (11% to 19%), headache (13% to 17%), CNS toxicity (1% to 11%)

Dermatologic: Rash (26% to 43%), pruritus (10% to 21%), skin disorder (4% to 17%)

Gastrointestinal: Nausea/vomiting (22% to 63%), diarrhea (15% to 17%), anorexia (13% to 16%), abdominal pain (4% to 16%), stomatitis (5% to 12%)

Hematologic: Myelosuppression (nadir: 7 days; recovery: 10-14 days), leukopenia (22% to 60%), anemia (8% to 35%), thrombocytopenia (6% to 32%)

Hepatic: Transaminases increased (2% to 19%)

Neuromuscular & skeletal: Myalgia (11% to 19%), weakness (10% to 12%)

Respiratory: Cough (17% to 20%), upper respiratory infection (13% to 16%), rhinitis (10% to 11%), dyspnea (8% to 11%)

Miscellaneous: Infection (7% to 36%), allergic reaction (2% to 11%)

1% to 10%:

Cardiovascular: Chest pain (3% to 10%), facial edema (3% to 10%), hypotension (3% to 10%), peripheral edema (3% to 10%), angina (<3%), arrhythmia (<3%), AV block (<3%), bradycardia (<3%), cardiac arrest (<3%), deep thrombophlebitis (<3%), heart failure (<3%), hypertension (<3%), pericardial effusion (<3%), sinus arrest (<3%), syncope (<3%), tachycardia (<3%), vasculitis (<3%), ventricular extrasystoles (<3%)

Central nervous system: Anxiety (3% to 10%), confusion (3% to 10%), depression (3% to 10%), dizziness (3% to 10%), insomnia (3% to 10%), nervousness (3% to 10%), somnolence (3% to 10%), abnormal dreams/thinking (<3%), amnesia (<3%), ataxia (<3%), emotional lability (<3%), encephalitis (<3%), hallucination (<3%), hostility (<3%), meningism (<3%), neuritis (<3%), neurosis (<3%), seizure (<3%), vertigo (<3%)

Dermatologic: Cellulitis (6%), furunculosis (4%), dry skin (3% to 10%), urticaria (3% to 10%), acne (<3%), alopecia (<3%), eczema (<3%), petechial rash (<3%), photosensitivity (<3%), abscess (2%)

Endocrine & metabolic: Amenorrhea (<3%), hypercalcemia (<3%), hyponatremia (<3%), gout (<3%), libido decreased/loss (<3%)

Gastrointestinal: Dyspepsia (3% to 10%) flatulence (3% to 10%), gingivitis (3% to 10%), constipation (<3%), dysphagia (<3%), glossitis (<3%), ileus (<3%), taste perversion (<3%), oral moniliasis (2%)

Genitourinary: Urinary tract infection (3%), impotence (<3%)

Hematologic: Agranulocytosis (3% to 10%), hemorrhage (3% to 10%), acute leukemia (<3%), aplastic anemia (<3%), hemolytic anemia (<3%)

Local: Phlebitis (<3%)

Neuromuscular & skeletal: Arthralgia (3% to 10%), paresthesia (3% to 10%), arthritis (<3%), dysarthria (<3%), hyperkinesia (<3%), neuralgia (<3%), neuropathy (<3%), paralysis (<3%), twitching (<3%), osteomyelitis (1%)

Ocular: Conjunctivitis (4%), amblyopia (<3%), eyes nonreactive (<3%), lacrimation disorder (<3%), photophobia (<3%), retinopathy (<3%), vision abnormal (<3%), watery eyes (<3%), xerophthalmia (<3%)

Otic: Deafness (<3%), earache (<3%), labyrinthitis (<3%), tinnitus (<3%)

Renal: Creatinine increased (3% to 10%), nephropathy (<3%), renal failure (<3%), renal insufficiency (<3%), renal function abnormal (<3%), renal stone (<3%)

Respiratory: Pharyngitis (8% to 10%), sinusitis (6%), pneumonia (5%), asthma (3% to 10%), bronchitis (3%), bronchospasm (<3%), laryngeal edema (<3%), pulmonary embolus (<3%)

Miscellaneous: Diaphoresis (8% to 10%), herpes zoster (8%), viral infection (≤8%), bacterial infection (5%), herpes simplex (4%), sepsis (3%), flu-like syndrome (<3%)

<1%, postmarketing, and/or case reports: Dysuria, fungal infection (skin), hematuria, lethargy, pulmonary edema, pulmonary toxicity (fatal; in combination with fludarabine), uveitis/vision loss

Oncology: VesicantNo

Oncology: Emetic PotentialModerate (30% to 60%)

Drug Interactions

Cyclophosphamide: Pentostatin may enhance the cardiotoxic effect of Cyclophosphamide. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Fludarabine: May enhance the adverse/toxic effect of Pentostatin. Pulmonary toxicity is of specific concern. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Pegademase Bovine: May diminish the therapeutic effect of Pentostatin. Pentostatin may diminish the therapeutic effect of Pegademase Bovine. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Monitoring ParametersCBC with differential, platelet count, liver function, serum uric acid, renal function (creatinine clearance), bone marrow evaluation

Nursing: Physical Assessment/MonitoringUse caution in the presence of renal insufficiency, fever, infection, or renal dysfunction. Assess other pharmacological products patient may be taking for potential adverse interactions. See Administration for infusion specifics. Assess results of laboratory tests prior to treatment and on a regular basis throughout therapy. Evaluate patient response closely (CNS, hematological and neuromuscular effects). Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential, platelet count, liver function, serum uric acid, renal function (creatinine clearance), bone marrow evaluation

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This drug is administered by infusion; report any burning, pain, redness, or swelling at infusion site. It is important to maintain adequate hydration (2-3 L/day of fluids unless instructed to restrict fluid intake) and nutrition (small, frequent meals may help). You will be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause mild nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); loss of hair (reversible); diarrhea (buttermilk, boiled milk, or yogurt may help); or mouth sores (use soft toothbrush or cotton swabs for oral care). Report extreme fatigue; pain or numbness in extremities; severe GI upset or diarrhea; bleeding or bruising; fever, chills, or sore throat; vaginal discharge; difficulty or pain on urination; muscle pain or weakness; unusual cough or respiratory difficulty; or other unusual side effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not get pregnant while taking this medication. Consult prescriber for appropriate barrier contraceptives. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [preservative free]: 10 mg [contains mannitol 50 mg]

Nipent®: 10 mg [contains mannitol 50 mg]

Generic AvailableYes

Mechanism of ActionPentostatin is a purine antimetabolite that inhibits adenosine deaminase, preventing the deamination of adenosine to inosine. Accumulation of deoxyadenosine (dAdo) and deoxyadenosine 5′-triphosphate (dATP) results in a reduction of purine metabolism and DNA synthesis and cell death.

Pharmacodynamics/Kinetics

Distribution: I.V.: V_d: 36.1 L (20.1 L/m^2); rapidly to body tissues

Protein binding: ~4%

Half-life elimination: Distribution half-life: 11-85 minutes; Terminal: 3-7 hours; renal impairment (Cl_{cr} <50 mL/minute): 4-18 hours

Excretion: Urine (~50% to 96%) within 24 hours (30% to 90% as unchanged drug)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSedation is common; may cause anxiety, confusion, insomnia, depression

Mental Health: Effects on Psychiatric TreatmentLeukopenia is common; avoid clozapine and carbamazepine

Medication Safety Issues

Sound-alike/look-alike issues:

Pentoxifylline may be confused with tamoxifen

Trental® may be confused with Bentyl®, Tegretol®, Trandate®

Pronunciation(pen toks IF i lin)

U.S. Brand NamesPentoxil®; Trental®

Canadian Brand NamesAlbert® Pentoxifylline; Apo-Pentoxifylline SR®; Nu-Pentoxifylline SR; ratio-Pentoxifylline; Trental®

Pharmacologic CategoryBlood Viscosity Reducer Agent

Use: Labeled IndicationsTreatment of intermittent claudication on the basis of chronic occlusive arterial disease of the limbs; may improve function and symptoms, but not intended to replace more definitive therapy

Use: Unlabeled/InvestigationalAIDS patients with increased TNF, CVA, cerebrovascular diseases, diabetic atherosclerosis, diabetic neuropathy, gangrene, hemodialysis shunt thrombosis, vascular impotence, cerebral malaria, septic shock, sickle cell syndromes, vasculitis, and venous leg ulcers

Dosing: Adults**Peripheral vascular disease:** Oral: 400 mg 3 times/day with meals; maximal therapeutic benefit may take 2-4 weeks to develop; recommended to maintain therapy for at least 8 weeks. May reduce to 400 mg twice daily if GI or CNS side effects occur.

Dosing: ElderlyRefer to adult dosing.

Administration: OralTablets should be swallowed whole; do not chew, break, or crush.

Dietary ConsiderationsMay be taken with meals or food.

StorageStore between 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to pentoxifylline, xanthines (eg, caffeine, theophylline), or any component of the formulation; recent cerebral and/or retinal hemorrhage

Warnings/Precautions

Special populations:

- Elderly: Use with caution in the elderly; start with lower doses.
- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsPentoxifylline's value in the treatment of intermittent claudication is controversial. Walking distance improved statistically in some clinical trials, but the actual distance was minimal when applied to improving physical activity.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women.

LactationEnters breast milk/not recommended

Adverse Reactions

1% to 10%: Gastrointestinal: Nausea (2%), vomiting (1%)

<1%, postmarketing, and/or case reports: Anaphylactoid reaction, angioedema, angina, anorexia, anxiety, aplastic anemia, arrhythmia, aseptic meningitis, bloating, blurred vision, brittle fingernails, chest pain, cholecystitis, confusion, conjunctivitis, constipation, depression, dyspnea, earache, edema, epistaxis, eructation, fibrinogen decreased (serum), flatus, flu-like syndrome, hallucinations, hepatitis, hypotension, jaundice, laryngitis, leukemia, leukopenia, liver enzymes increased, malaise, nasal congestion, pancytopenia, pruritus, purpura, rash, scotoma, seizure, sialism, sore throat, taste perversion, tachycardia, thrombocytopenia, tremor, urticaria, weight change, xerostomia

Metabolism/Transport Effects**Inhibits** CYP1A2 (weak)

Drug Interactions

Ciprofloxacin: May enhance the adverse/toxic effect of Pentoxifylline. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Pentoxifylline. Specifically, the risk of bleeding may be increased with this combination. *Risk X: Avoid combination*

Theophylline Derivatives: Pentoxifylline may increase the serum concentration of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Food may decrease rate but not extent of absorption. Pentoxifylline peak serum levels may be decreased if taken with food.

Test InteractionsDecreased calcium (S), magnesium (S); false-positive theophylline levels

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess therapeutic effectiveness, and adverse reactions at regular intervals during therapy (eg, cardiac status and blood pressure). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This may relieve pain of claudication, but additional therapy may be recommended. Take as prescribed for full length of prescription. May cause dizziness (use caution when driving or engaging in tasks that are potentially hazardous until response to drug is known); or heartburn, nausea, or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report chest pain; swelling of lips, mouth, or tongue; persistent headache; respiratory difficulty; rash; or unrelieved nausea or vomiting. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, controlled release:

Trental®: 400 mg

Tablet, extended release: 400 mg

Pentoxil®: 400 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablet, controlled release (Pentoxifylline CR)

400 mg (100): $23.33

Tablet, controlled release (Pentoxil)

400 mg (100): $25.99

Tablet, controlled release (Trental)

400 mg (60): $71.60

Mechanism of ActionReduces blood viscosity via increased leukocyte and erythrocyte deformability and decreased neutrophil adhesion/activation; improves peripheral tissue oxygenation presumably through enhanced blood flow.

Pharmacodynamics/Kinetics

Absorption: Well absorbed

Metabolism: Hepatic and via erythrocytes; extensive first-pass effect

Half-life elimination: Parent drug: 24-48 minutes; Metabolites: 60-96 minutes

Time to peak, serum: 2-4 hours

Excretion: Primarily urine (active metabolites); feces (4%)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause anxiety, confusion, depression, dizziness, or rarely agitation

Mental Health: Effects on Psychiatric TreatmentMay cause seizures; use with caution with concomitant use of clozapine, which is associated with dose-dependent risk of seizures

Cardiovascular ConsiderationsPentoxifylline may be used in the treatment of peripheral vascular disease; however, its efficacy is not fully established. The role of cytokine modulation with pentoxifylline in patients with heart failure is under investigation.

Anesthesia and Critical Care Concerns/Other ConsiderationsPentoxifylline may be used in the treatment of peripheral vascular disease, however, its efficacy is not fully established. Therapeutic effects may be seen after 2-4 weeks.

Index TermsOxpentifylline

Perflutren Lipid Microspheres

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Perflutren Lipid Microsphere (Definity®): Revised Contraindications - May 2008; updated July 2008

Lantheus Medical Imaging, in conjunction with the Food and Drug Administration (FDA), has revised the contraindications of perflutren lipid microsphere. Perflutren lipid microsphere is no longer contraindicated in patients with serious ventricular arrhythmias, at high risk for ventricular arrhythmias due to QT prolongation, pulmonary arterial vascular compromise (eg, pulmonary embolism, pulmonary hypertension, severe emphysema), or an unstable cardiopulmonary status (eg, unstable angina, acute MI, respiratory failure, recent worsening or clinically unstable HF).

Updated U.S. labeled contraindications now include only those patients with hypersensitivity to perflutren and right-to-left, bidirectional, or transient right-to-left cardiac shunt.

In July 2008, the FDA issued a Medwatch alert to inform healthcare professionals of the labeling changes, including revisions to the boxed warnings and warnings emphasizing the risk of cardiopulmonary reactions. These product labeling changes have previously been incorporated into the perflutren lipid microsphere Lexi-Comp monograph.

For more information, U.S. healthcare professionals may refer to the following websites:

http://www.lantheus.com/News.html

http://www.fda.gov/medwatch/safety/2008/safety08.htm#Microbubble

Pronunciation(per FLOO tren LIPid MI kro SFIRS)

U.S. Brand NamesDefinity®

Canadian Brand NamesDefinity®

Pharmacologic CategoryDiagnostic Agent

Use: Labeled IndicationsOpacification of left ventricular chamber and improvement of delineation of the left ventricular endocardial border in patients with suboptimal echocardiograms

Dosing: AdultsDose should be given following baseline noncontrast echocardiography. Imaging should begin immediately following dose and compared to noncontrast image. Mechanical index for the ultrasound device should be set at ≤0.8. **Note:** Maximum dose is either two I.V. bolus doses or one single I.V. infusion.

I.V. bolus: 10 microliters (µL)/kg of activated product, followed by 10 mL saline flush; may repeat in 30 minutes if needed

I.V. infusion: Initial: 4 mL/minute (or 240 mL/hour) of prepared infusion; titrate to achieve optimal image; maximum rate: 10 mL/minute (or 600 mL/hour)

Dosing: ElderlyRefer to adult dosing.

Administration: I.V.

I.V. bolus: Administer over 30-60 seconds, follow with 10 mL saline flush

I.V. infusion rate: 4 mL/minute (or 240 mL/hour) to 10 mL/minute (or 600 mL/hour)

StoragePrior to activation, store under refrigeration, 2°C to 8°C (36°F to 46°F). Following activation, store at room temperature.

ReconstitutionPrior to administration, product must be activated. To activate, first bring vial to room temperature. Vial should then be shaken for 45 seconds using the Vialmix™ apparatus (which should be obtained from the manufacturer). Do **not** use if the 45 second activation cycle has not been completed. Following activation, the product will appear milky and may be used immediately. Activated product must be used within 12 hours. If not used within 5 minutes of activation, resuspend using hand agitation for 10 seconds. To withdraw product, invert vial and aseptically position needle (18 or 20 gauge) or dispensing pin in center of liquid; do **not** inject air. Once withdrawn from vial into a syringe, use immediately. Do **not** allow product to stand in syringe. Product does not contain bacterial preservative. Vial is for single use only.

To prepare I.V. infusion, add 1.3 mL activated product to 50 mL preservative free saline.

ContraindicationsHypersensitivity to perflutren, octafluoropropane (OFP) or any component of the formulation; right-to-left, bidirectional, or transient right-to-left cardiac shunt; administration by intra-arterial injection

Warnings/Precautions

Boxed warning:

- Serious cardiopulmonary reactions: See “Concerns related to adverse effects” below

Concerns related to adverse effects:

- Anaphylactoid reactions: Postmarketing reports of anaphylactoid reactions (eg, shock, bronchospasm, upper airway swelling, loss of consciousness, urticaria and pruritus) have been reported in patients with no prior exposure. Monitor for signs and symptoms of anaphylactoid reactions. Immediate treatment (including epinephrine 1:1000) should be available.

- Serious cardiopulmonary reactions: **[U.S. Boxed Warning]: Serious cardiopulmonary reactions (some fatal) have occurred during or within 30 minutes following administration. Ensure patient does not have any contraindications for use. Equipment for resuscitation and trained personnel experienced in handling medical emergencies should always be immediately available.** In patients with pulmonary hypertension or unstable cardiopulmonary conditions (eg, unstable angina, acute MI, respiratory failure, patients receiving mechanical ventilation, recent worsening or unstable HF, serious ventricular arrhythmias), monitor (eg, vital signs, cardiac rhythm, and oxygen saturation) during and for at least 30 minutes following administration.

- QT_c prolongation: Transient QT_c prolongation (>30 msec) has been observed, some with associated cardiac rhythm changes; malignant symptomatology was not observed in clinical trials. The effects of concomitant drugs have not been evaluated. Monitor patients at high risk for ventricular arrhythmias due to QT_c prolongation.

- Ventricular arrhythmias: High ultrasound mechanical indices with or without end-systolic triggering may cause ventricular arrhythmias. Safety of activated perflutren lipid microspheres with mechanical indices >0.8 or end-systolic triggering has not been established.

Disease-related concerns:

- Cardiac shunts: Patients with right-to-left, bidirectional, or transient right-to-left cardiac shunts should not receive perflutren lipid microsphere. Use of phospholipid encapsulated microspheres will result in microvascular occlusion and ischemia since the pulmonary particle-filtering mechanism will be bypassed resulting in a direct transfer from venous to arterial circulation.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: Product must be activated prior to use.

- Cardiac stress testing: Safety and efficacy with exercise stress or pharmacologic stress testing have not been established.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAnimal studies have not shown adverse to the fetus, however, reproduction studies have not been performed in humans. Use during pregnancy only if clearly needed.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%: Cardiovascular: QT_c prolongation (>30 msec, 29%)

1% to 10%:

Cardiovascular: Arrhythmia (secondary to QT prolongation, 8%); flushing (1%)

Central nervous system: Headache (2%)

Gastrointestinal: Nausea (1%)

Neuromuscular & skeletal: Back pain (1%)

Renal: Renal pain (1%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Abdominal pain, albuminuria, anaphylactoid reactions, arthralgia, atrial fibrillation, bradycardia, bronchospasm, cardiac arrest, chest pain, conjunctivitis, convulsions, cough, diarrhea, dizziness, diaphoresis, dyspnea, dyspepsia, ECG abnormal, eosinophilia, erythematous rash, fatigue, fever, granulocytosis, hearing impairment, hematoma, hot flashes, hyper-/hypotension, hypersensitivity reaction, hypertonia, hypoxia, injection site reactions, leg cramps, leukocytosis, leukopenia, loss of consciousness, lymphadenopathy, monocytosis, myocardial ischemia, oxygenation decreased, pain, palpitation, paresthesia, pharyngitis, pruritus, rash, respiratory arrest, respiratory distress, rhinitis, rigors, supraventricular tachycardia, syncope, tachycardia, taste perversion, upper respiratory tract edema, urine abnormal, urticaria, ventricular fibrillation, ventricular tachycardia, vertigo, visual abnormalities, vomiting, xerostomia

Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Monitoring Parameters Cardiopulmonary reactions in all patients; in high-risk patients, closely monitor blood pressure, heart rate, oxygen saturation, cardiac rhythm monitoring (during and for 30 minutes following infusion)

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]: OFP 6.52 mg/mL and lipid blend 0.75 mg/mL (2 mL) [following activation, forms a suspension containing perflutren lipid microspheres 1.2 x 10^{10}/mL and OFP 1.1 mg/mL]

Generic Available No

ManufacturerLantheus Medical Imaging

Mechanism of Action Activated perflutren lipid microspheres provide contrast enhancement of the endocardial borders during echocardiography.

Pharmacodynamics/Kinetics

Onset of action: Immediate

Duration: I.V. bolus: 3.4 minutes; I.V. infusion: 7.1 minutes

Metabolism: OFP: not metabolized; Phospholipid component: Free fatty acids

Half-life elimination: OFP: 1.3 minutes (healthy patients); 1.9 minutes (patients with COPD)

Pharmacotherapy Pearls Following activation, a suspension is formed containing perflutren lipid microspheres. The perflutren lipid microspheres are composed of octafluoropropane (OFP) encapsulated in a phospholipid outer shell.

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment None reported

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Perflutren Lipid Microsphere (Definity®) and Perflutren Protein Type A Microsphere (Optison™): Revised Boxed Warnings, Warnings, and Contraindications - July 2008

The Food and Drug Administration (FDA) has revised the contraindications, boxed warnings, and warnings for microbubble contrast agents (perflutren lipid microsphere and perflutren protein type A microspheres). Perflutren protein type A microspheres (Optison™) is no longer contraindicated in patients with serious ventricular arrhythmias, at high risk for ventricular arrhythmias due to QT prolongation, pulmonary arterial vascular compromise (eg, pulmonary embolism, pulmonary hypertension, severe emphysema), or an unstable cardiopulmonary status (eg, unstable angina, acute MI, respiratory failure, recent worsening or clinically unstable HF). The FDA has determined that the diagnostic benefits derived from use in some patients may outweigh the risk for serous cardiopulmonary reactions. Updated U.S. labeled contraindications now include only those patients with hypersensitivity to perflutren and right-to-left, bidirectional, or transient right-to-left cardiac shunt.

Revisions to the boxed warnings and warnings emphasize the risk of cardiopulmonary reactions that can occur during or within 30 minutes following administration. Patients with pulmonary hypertension or unstable cardiopulmonary conditions (eg, unstable angina, acute MI, respiratory failure, patients receiving mechanical ventilation, recent worsening or unstable HF, serious ventricular arrhythmias) should be monitored closely (eg, vital signs, cardiac rhythm, and oxygen saturation) during and for at least 30 minutes following administration.

The FDA MedWatch alert can be found at:

http://www.fda.gov/medwatch/safety/2008/safety08.htm#Microbubble

Pronunciation(per FLOO tren PRO teen typ aye)

U.S. Brand NamesOptison™

Pharmacologic CategoryDiagnostic Agent

Use: Labeled IndicationsOpacification of left ventricular chamber and improvement of delineation of the left ventricular endocardial border in patients with suboptimal echocardiograms

Dosing: Adults

I.V.: 0.5 mL via peripheral vein; flush with D_5W or NS following dose; may repeat in increments of 0.5 mL up to 5 mL cumulatively in 10 minutes (maximum total dose: 8.7 mL in any one patient study)

Dosing: ElderlyRefer to adult dosing.

Administration: I.V.

While allowing the vial to come to room temperature, it should be inverted and gently rotated to resuspend the microspheres; the solution should appear milky-white. Do **not** use if solution is clear. The vial should then be vented with a sterile vent spike or 18-gauge needle. Air should **not** be injected into the vial. The dose should be removed from the vial and injected at a rate ≤1 mL/second into a peripheral vein within 1 minute of resuspension. Resuspension should be repeated prior to injection if more than 1 minute elapses. Flush line with D_5W or NS immediately after injection.

Administration: I.V. Detail

pH: 6.4-7.4

StorageStore under refrigeration at 2°C to 8°C (36°F to 46°F); do not freeze. Discard unused portion.

ContraindicationsHypersensitivity to perflutren or any component of the formulation, blood, blood products, or albumin; right-to-left, bidirectional, or transient right-to-left cardiac shunt; administration by intra-arterial injection

Warnings/Precautions

Boxed warning:

- Serious cardiopulmonary reactions: See “Concerns related to adverse effects” below

Concerns related to adverse effects:

- Anaphylactoid reactions: Postmarketing reports of anaphylactoid reactions (eg, shock, bronchospasm, upper airway swelling, loss of consciousness, urticaria and pruritus) have been reported in patients with no prior exposure. Monitor for signs and symptoms of anaphylactoid reactions. Immediate treatment (including epinephrine 1:1000) should be available.

- Serious cardiopulmonary reactions: **[U.S. Boxed Warning]: Serious cardiopulmonary reactions (some fatal) have occurred during or within 30 minutes following administration. Ensure patient does not have any contraindications for use. Equipment for resuscitation and trained personnel experienced in handling medical emergencies should always be immediately available.** In patients with pulmonary hypertension or unstable cardiopulmonary conditions (eg, unstable angina, acute MI, respiratory failure, patients receiving mechanical ventilation, recent worsening or unstable HF, serious ventricular arrhythmias), monitor (eg, vital signs, cardiac rhythm, and oxygen saturation) during and for at least 30 minutes following administration.

- QT_c prolongation: Transient QT_c prolongation (>30 msec) has been observed with another microbubble contrast agent (perflutren lipid microsphere), some with associated cardiac rhythm changes; malignant symptomatology was not observed in clinical trials. Clinical trials evaluating the effects of perflutren protein-type A microspheres on the QT interval have not been conducted; however, effects on the QT interval are expected to be similar. Monitor patients at high risk of arrhythmias due to QT_c prolongation.

- Ventricular arrhythmias: High ultrasound mechanical indices with or without end-systolic triggering may cause ventricular arrhythmias. Safety of perflutren protein-type A microspheres with mechanical indices >0.8 or end-systolic triggering has not been established.

Disease-related concerns:

- Cardiac shunts: Patients with right-to-left, bidirectional, or transient right-to-left cardiac shunts should **not** receive perflutren protein-type A microspheres. Use of phospholipid encapsulated microspheres will result in microvascular occlusion and ischemia since the pulmonary particle-filtering mechanism will be bypassed resulting in a direct transfer from venous to arterial circulation.

- Congenital heart defects: Extreme caution should be used in patients with congenital heart defects. Safety and efficacy have not been established in this population.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Albumin: Product contains albumin; may carry a remote risk of virus transmission or hypersensitivity reaction.

Other warnings/precautions:

- Cardiac stress testing: Safety and efficacy with exercise stress or pharmacologic stress testing have not been established.

Pregnancy Risk FactorC

Pregnancy ConsiderationsEmbryotoxic, fetotoxic, and teratogenic effects were observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Use only when potential benefits outweigh the potential hazards to the fetus.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

1% to 10%:

Cardiovascular: Flushing (4%), chest pain (1%)

Central nervous system: Headache (5%), dizziness (3%), chills/fever (1%), malaise/weakness/fatigue (1%)

Gastrointestinal: Nausea/vomiting (4%), altered taste (2%)

Local: Injection site discomfort (1%)

Respiratory: Dyspnea (1%)

Miscellaneous: Flu-like syndrome (1%)

<1%, postmarketing, and/or case reports: Anaphylactoid reaction, arthralgia, back pain, body or muscle aches, bronchospasm, burning sensation in the eyes, cardiac arrest, cardiopulmonary reaction, cough, discoloration at the injection site, eosinophilia, erythema, eye irritation, hypersensitivity, hypotension, induration, irritability, loss of consciousness, oxygen desaturation, palpitation, paresthesia, photophobia, premature ventricular contraction, pruritus, rash, respiratory arrest, respiratory distress, seizure, supraventricular fibrillation, supraventricular tachycardia, tinnitus, tremor, upper airway swelling, urticaria, ventricular fibrillation, ventricular tachycardia, visual blurring, wheezing, xerostomia

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersCardiopulmonary reactions in all patients; in high-risk patients, closely monitor blood pressure, heart rate, oxygen saturation, cardiac rhythm (during and for 30 minutes following infusion)

Nursing: Physical Assessment/MonitoringThis medication is administered I.V. and is used short term for increased visualization during an echocardiogram. Monitor patient for allergic response.

Patient EducationThis medication is administered to increase visualization during an echocardiogram. You may experience headache, nausea, dizziness, or flushing. Report immediately any chest pain or difficulty breathing. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, suspension [preservative free]:

Optison™: Perflutren 0.11-0.33 mg and protein-type A microspheres 5-8 x 10^8 per mL (3 mL) [contains human albumin 10 mg/mL]

Generic AvailableNo

ManufacturerMallinckrodt Inc

Mechanism of ActionPerflutren is a stable gas that provides an echogenic contrast effect in the blood and allows for improved delineation of the left ventricular endocardial border.

Pharmacodynamics/Kinetics

Duration: Contrast enhancement: Dose dependent: 1 minute (0.2 mL) to 5 minutes (5 mL)

Metabolism: Perflutren: Not metabolized

Half-life elimination: 0.6-2 minutes

Excretion: Perflutren: Lungs

Mental Health: Effects on Mental StatusMay cause dizziness or fatigue

Mental Health: Effects on Psychiatric TreatmentNone reported

Periciazine

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(per ee CYE ah zeen)

Canadian Brand NamesNeuleptil®

Pharmacologic CategoryAntipsychotic Agent, Typical, Phenothiazine, Piperidine

Use: Labeled IndicationsAdjunctive therapy in selected psychotic patients to control prevailing hostility, impulsivity, or aggression

Dosing: Adults

Oral: 5-20 mg in the morning, followed by 10-40 mg in the evening. In dividing doses, it is suggested that the larger dose should be administered in the evening. In general, lower dosage should be used on initiation and gradually increased based on effect and tolerance.

Dosing: Elderly

Initial daily dose should be ~5 mg/day. May be increased gradually based on effect and tolerance. Refer to adult dosing.

Dosing: Pediatric

Children >5 years: Oral: 2.5-10 mg in the morning, followed by 5-30 mg in the evening. In general, lower dosage should be used on initiation and gradually increased based on effect and tolerance.

Dosing: Renal ImpairmentNo adjustment required.

StorageStore at room temperature of 20°C to 25°C (68°F to 77°F). Protect from light.

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to periciazine, phenothiazine derivatives, or any component of the formulation; severe CNS depression including acute intoxication with CNS depressant medications; subcortical brain damage; hepatic dysfunction; circulatory collapse; severely-depressed patients; bone marrow suppression; blood dyscrasias; coma; patients receiving spinal or regional anesthesia

Warnings/Precautions

Concerns related to adverse effects:

- Altered cardiac conduction: May alter cardiac conduction (life-threatening arrhythmias have occurred with therapeutic doses of phenothiazines); relative risk with periciazine has not been established, although rare cases of QT_c prolongation have been reported.
- Anticholinergic effects: Phenothiazines may cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems.
- Blood dyscrasias: Check blood counts periodically and discontinue at first signs of blood dyscrasias; use is contraindicated in patients with bone marrow suppression.
- Esophageal dysmotility/aspiration: Antipsychotic use has been associated with esophageal dysmotility and aspiration; use with caution in patients at risk of pneumonia (ie, Alzheimer's disease).
- Extrapyramidal symptoms: May cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia.
- Neuroleptic malignant syndrome (NMS): May be associated with NMS; monitor for mental status changes, fever, muscle rigidity, and/or autonomic instability (risk may be increased in patients with Parkinson's disease or Lewy body dementia).
- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).
- Pigmentary retinopathy: Prolonged therapy may cause pigmentary retinopathy, corneal deposits, and/or changes in skin pigmentation.
- Sedation: May cause sedation, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Temperature regulation: Impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with severe cardiovascular disease.
- Glaucoma: Use with caution in patients with narrow-angle glaucoma; condition may be exacerbated by cholinergic blockade. Screening is recommended.

- Mitral valve prolapse: Use with caution in patients with mitral valve prolapse; may worsen.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; condition may be exacerbated by cholinergic blockade.

- Parkinson's disease: Use with caution in patients with Parkinson's disease; they may be more sensitive to adverse effects.

- Pheochromocytoma: Use with caution in patients with pheochromocytoma; may worsen.

- Prolactin-dependent tumors: Use with caution in patients with breast cancer or other prolactin-dependent tumors; elevates prolactin levels.

- Respiratory disease: Use with caution in patients with respiratory disease.

- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

Concurrent drug therapy issues:

- Antiemetic effects: May mask toxicity of other drugs or conditions (eg, intestinal obstruction, Reye's syndrome, brain tumor) due to antiemetic effects.

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; increased risk for developing tardive dyskinesia.

Pregnancy ConsiderationsTeratogenic effects were observed in some animal studies. Safety and efficacy have not been established in pregnant women.

Adverse ReactionsFrequency not defined; listing includes adverse reactions reported with other agents from the phenothiazine class.

Cardiovascular: AV block, cardiac arrest, ECG changes, edema, hypotension, paroxysmal atrial tachycardia, QT_c prolongation, syncope, tachycardia

Central nervous system; Aggressive behavior, agitation, anxiety, bizarre dreams, cerebral edema, depression, dizziness, drowsiness, EEG changes, excitement; extrapyramidal symptoms (tremor, akathisia, dystonia, dyskinesia, oculogyric, opisthotonos, hyper-reflexia, pseudo-Parkinsonism, rigidity, sialorrhea); fatigue, fever, headache, insomnia, paradoxical psychosis, restlessness, seizure, sleep disturbance, tardive dyskinesia

Dermatologic: Angioedema, dermatitis, eczema, epithelial keratopathy, erythema, exfoliative dermatitis, photosensitivity, pruritus, rash, seborrhea, skin pigmentation (prolonged therapy), urticaria

Endocrine & metabolic: Anorexia, appetite increased, delayed ovulation, galactorrhea, gynecomastia, libido changes, menstrual irregularities, thirst, weight changes

Gastrointestinal: Adynamic ileus, constipation, fecal impaction, nausea, salivation, vomiting, xerostomia

Genitourinary: Bladder paralysis, impotence, incontinence, polyuria, urinary retention

Hematologic: Agranulocytosis, anemia, eosinophilia, leukopenia, pancytopenia, thrombocytopenia

Hepatic: Cholestasis, cholestatic jaundice, jaundice

Ocular: Blurred vision, corneal deposits (prolonged therapy), glaucoma, lenticular deposits, pigmentary retinopathy (prolonged therapy)

Respiratory: Nasal congestion, pneumonia, pneumonitis

Miscellaneous: Diaphoresis increased, lupus-like syndrome

Metabolism/Transport EffectsNo published data on CYP metabolism. Based on structural analysis, may be a substrate of CYP2D6 and 3A4.

Drug InteractionsNo published data on CYP metabolism. Based on structural analysis, may be a substrate of CYP2D6 and 3A4.

Aluminum salts: May decrease the absorption of phenothiazines; monitor.

Amphetamines: Efficacy may be diminished by antipsychotics; in addition, amphetamines may increase psychotic symptoms; avoid concurrent use.

Anticholinergics: May inhibit the therapeutic response to phenothiazines and excess anticholinergic effects may occur; includes benztropine, trihexyphenidyl, biperiden, and drugs with significant anticholinergic activity (TCAs, antihistamines, disopyramide).

Antihypertensives: Concurrent use of phenothiazines with an antihypertensive may produce additive hypotensive effects (particularly orthostasis).

Beta-blockers: May increase the risk of arrhythmia; serum concentrations of phenothiazines may be increased; propranolol also increases phenothiazine concentrations; may also occur with pindolol. Propranolol and pindolol are contraindicated.

Bromocriptine: Phenothiazines inhibit the ability of bromocriptine to lower serum prolactin concentrations.

Carvedilol: Serum concentrations may be increased, leading to hypotension and bradycardia; avoid concurrent use.

CNS depressants: Sedative effects may be additive with phenothiazines; monitor for increased effect; includes barbiturates, benzodiazepines, opioid analgesics, ethanol, and other sedative agents.

CYP2D6 inhibitors: May increase the levels/effects of Periciazine. Example inhibitors include chlorpromazine, delavirdine, fluoxetine, miconazole, paroxetine, pergolide, quinidine, quinine, ritonavir, and ropinirole. Other piperidine phenothiazines (thioridazine) are contraindicated with inhibitors of this enzyme.

CYP3A4 inhibitors: May increase the levels/effects of Periciazine. Example inhibitors include azole antifungals, clarithromycin, diclofenac, doxycycline, erythromycin, imatinib, isoniazid, nefazodone, nicardipine, propofol, protease inhibitors, quinidine,telithromycin, and verapamil.

Epinephrine: Low potency antipsychotics may diminish the pressor effects of epinephrine.

Guanethidine and guanadrel: Antihypertensive effects may be inhibited by phenothiazines.

Levodopa: Phenothiazines may inhibit the antiparkinsonian effect of levodopa; avoid this combination.

Lithium: Phenothiazines may produce neurotoxicity with lithium; this is a rare effect.

Metoclopramide: May increase extrapyramidal symptoms (EPS) or risk.

Phenytoin: May reduce serum levels of phenothiazines; phenothiazines may increase phenytoin serum levels.

Polypeptide antibiotics (eg, bacitracin): Rare cases of respiratory paralysis have been reported with concurrent use of phenothiazines.

Potassium-depleting agents: May increase the risk of serious arrhythmias with phenothiazines; includes many diuretics, aminoglycosides, and amphotericin; monitor serum potassium closely.

QT_c-prolonging agents: Effects on QT_c interval may be additive with phenothiazines, increasing the risk of malignant arrhythmias; includes type Ia antiarrhythmics, TCAs, and some quinolone antibiotics (moxifloxacin). These agents are contraindicated with other piperidine phenothiazines (thioridazine).

Sulfadoxine-pyrimethamine: May increase phenothiazine concentrations.

Trazodone: Phenothiazines and trazodone may produce additive hypotensive effects.

Tricyclic antidepressants: Concurrent use may produce increased toxicity or altered therapeutic response.

Valproic acid: Serum levels may be increased by phenothiazines.

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid kava kava, valerian, St John's wort, gotu kola (may increase CNS depression). Avoid dong quai, St John's wort (may also cause photosensitization). Cigarette smoking may decrease the serum concentrations of periciazine.

Test InteractionsPhenothiazines have been reported to cause false-positive pregnancy tests.

Monitoring ParametersVital signs; serum potassium and magnesium, lipid profile, waist circumference, fasting blood glucose/Hgb A_{1c}; BMI; mental status, abnormal involuntary movement scale (AIMS); periodic eye exam and evaluation of renal and liver function tests (long-term therapy).

Based on experience with other piperidine phenothiazines: Consider baseline and periodic ECG; do not initiate if QT_c >450 msec.

Nursing: Physical Assessment/MonitoringAssess other prescription and OTC medications the patient may be taking to avoid duplications and interactions. Monitor pulse and blood pressure at beginning and periodically during therapy. Monitor cardiac status. Observe for fluid retention. Monitor weight. Assess knowledge/teach patient appropriate use, side effects, and symptoms to report.

Monitoring: Lab TestsSerum potassium and magnesium, lipid profile, fasting blood glucose/Hgb A_{1c}; evaluation of renal and liver function tests (long-term therapy).

Based on experience with other piperidine phenothiazines: Consider baseline and periodic ECG; do not initiate if QT_c >450 msec.

Patient EducationInform prescriber of all prescription medications, OTC medications, or herbal products you are taking. Avoid alcohol; may increase drowsiness. Maintain adequate hydration (2-3 L/day) unless instructed to restrict intake by prescriber. May cause CNS changes (eg, confusion, depression, increased sedation, excitation, headache, agitation, insomnia or nightmares, dizziness, fatigue, impaired coordination, changes in personality, or changes in cognition). Use caution when driving or engaging in activities requiring alertness until response to drug is known. May also cause orthostatic hypotension (use caution when changing position from lying or sitting to standing). Report rapid or irregular pulse, fainting, sudden weight gain >5 lbs per week, shortness of breath, chest pain, or swelling of the extremities.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Capsule:

Neuleptil® [CAN]: 5 mg, 10 mg, 20 mg [not available in the U.S.]

Solution, oral drops:

Neuleptil® [CAN]: 10 mg/mL (100 mL) [contains ethanol 12% and sucrose 250 mg/mL [not available in the U.S.]

ManufacturerErfa Canada Inc

Mechanism of ActionBlocks postsynaptic mesolimbic dopaminergic receptors in the brain; depresses the release of hypothalamic and hypophyseal hormones.

Dental Health Professional ConsiderationsThis drug is known to prolong the QT interval. The QT interval is measured as the time and distance between the Q point of the QRS complex and the end of the T wave in the ECG tracing. After adjustment for heart rate, the QT interval is defined as prolonged if it is more than 450 msec in men and 460 msec in women. A long QT syndrome was first described in the 1950s and 60s as a congenital syndrome involving QT interval prolongation and syncope and sudden death. Some of the congenital long QT syndromes were characterized by a peculiar electrocardiographic appearance of the QRS complex involving a premature atria beat followed by a pause, then a subsequent sinus beat showing marked QT prolongation and deformity. This type of cardiac arrhythmia was originally termed “torsade de pointes” (translated from the French as “twisting of the points”).

Prolongation of the QT interval is thought to result from delayed ventricular repolarization. The repolarization process within the myocardial cell is due to the efflux of intracellular potassium. The channels associated with this current can be blocked by many drugs and predispose the electrical propagation cycle to torsade de pointes.

Periciazine is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment:

Significant hypotension may occur, especially when the drug is administered parenterally. Orthostatic hypotension is due to alpha-receptor blockade; elderly are at greater risk.

Tardive dyskinesia: Prevalence rate may be 40% in elderly; development of the syndrome and the irreversible nature are proportional to duration and total cumulative dose over time. Extrapyramidal reactions are more common in elderly with up to 50% developing these reactions after 60 years of age. Drug-induced Parkinson's syndrome occurs often; akathisia is the most common extrapyramidal reaction in elderly.

Increased confusion, memory loss, psychotic behavior, and agitation frequently occur as a consequence of anticholinergic effects. Antipsychotic-associated sedation in nonpsychotic patients is extremely unpleasant due to feelings of depersonalization, derealization, and dysphoria.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsMost pharmacology textbooks state that in presence of phenothiazines, systemic doses of epinephrine paradoxically decrease the blood pressure. This is the so called “epinephrine reversal” phenomenon. This has never been observed when epinephrine is given by infiltration as part of the anesthesia procedure. See Dental Comment.

Mental Health CommentIn 2008, the FDA issued a warning regarding increased mortality risk with typical **and** atypical antipsychotic drugs when used in elderly patients with dementia-related psychosis.

Canadian Brand NamesCoversyl® Plus

Pharmacologic CategoryAngiotensin-Converting Enzyme (ACE) Inhibitor; Diuretic, Thiazide-Related

Use: Labeled IndicationsTreatment of hypertension; not indicated for initial treatment of hypertension

Dosing: Adults**Note: Not for initial therapy. Titration of individual components to an appropriate clinical response is required prior to converting to an equivalent dose of the combination product.**

Hypertension: Oral: Usual maintenance dose: Perindopril 4 mg/indapamide 1.25 mg once daily

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} ≥30-60 mL/minute: Use with caution due to perindopril component. No specific dosing guidelines for the combination product provided with approved labeling.

Cl_{cr} <30 mL/minute: Use not recommended.

Dosing: Hepatic ImpairmentNo specific dosing available. Contraindicated in patients with hepatic coma.

Administration: OralAdminister early in the day to avoid nocturia. Food may decrease the bioavailability of perindoprilat (active metabolite of perindopril).

Dietary ConsiderationsTake without food.

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F).

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to perindopril, indapamide, any other component of the formulation, or sulfonamide-derived drugs; angioedema related to previous treatment with an ACE inhibitor; progressive, severe oliguria; anuria; hepatic coma

Warnings/Precautions

Concerns related to adverse effects:

- Angioedema: At any time during treatment (especially following first dose), angioedema may occur rarely with ACE inhibitors; it may involve the head and neck (potentially compromising airway) or the intestine (presenting with abdominal pain). African-Americans and patients with idiopathic or hereditary angioedema or previous angioedema associated with ACE inhibitor therapy may be at an increased risk. Prolonged frequent monitoring may be required especially if tongue, glottis, or larynx are involved as they are associated with airway obstruction. Patients with a history of airway surgery may have a higher risk of airway obstruction. Aggressive early and appropriate management is critical.

- Cholestatic jaundice: A rare toxicity associated with ACE inhibitors includes cholestatic jaundice, which may progress to fulminant hepatic necrosis; discontinue if marked elevation of hepatic transaminases or jaundice occurs. Consider discontinuing therapy if symptoms of hepatic dysfunction (eg, fever, malaise, muscle pain, rash) present within the first weeks to months of therapy.

- Cough: An ACE inhibitor cough is a dry, hacking, nonproductive one that usually occurs within the first few months of treatment and should generally resolve within 1-4 weeks after discontinuation of the ACE inhibitor. Other causes of cough should be considered (eg, pulmonary congestion in patients with heart failure) and excluded prior to discontinuation.

- Dermatologic reactions: Severe reactions (eg, Stevens-Johnson syndrome, erythema multiforme) rarely have been observed with indapamide use in postmarketing studies.

- Electrolyte disturbances: Hyperkalemia may occur with ACE inhibitors; risk factors include renal dysfunction, diabetes mellitus, and concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely. Indapamide may cause hypokalemia, hypochloremic alkalosis, and hyponatremia. Measure potassium levels during the first week of therapy.

- Hypersensitivity reactions: Anaphylactic/anaphylactoid reactions can occur with ACE inhibitors. Severe anaphylactoid reactions may be seen during hemodialysis (eg, CVVHD) with high-flux dialysis membranes (eg, AN69), and rarely, during low density lipoprotein apheresis with dextran sulfate cellulose. Rare cases of anaphylactoid reactions have been reported in patients undergoing sensitization treatment with hymenoptera (bee, wasp) venom while receiving ACE inhibitors.

- Hypotension/syncope: Symptomatic hypotension with or without syncope can occur with ACE inhibitors (usually with the first several doses); effects are most often observed in volume-depleted patients; correct volume depletion prior to initiation; close monitoring of patient is required especially with initial dosing and dosing increases; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. Although dose reduction may be necessary, hypotension is not a reason for discontinuation of future ACE inhibitor use especially in patients with heart failure where a reduction in systolic blood pressure is a desirable observation.

- Neutropenia/agranulocytosis: Another ACE inhibitor, captopril, has been associated with rare cases of agranulocytosis, neutropenia, or leukopenia with myeloid hypoplasia. Patients with renal impairment are at high risk of developing neutropenia. Patients with both renal impairment and collagen vascular disease (eg, systemic lupus erythematosus) are at an even higher risk of developing neutropenia. Periodically monitor CBC with differential in these patients.

- Photosensitivity: Photosensitization may occur.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Aortic stenosis: Use with caution in patients with severe aortic stenosis; may reduce coronary perfusion resulting in ischemia.

- Cardiovascular disease: Initiation of therapy in patients with ischemic heart disease or cerebrovascular disease warrants close observation due to the potential consequences posed by falling blood pressure (eg, MI, stroke). Fluid replacement if needed may restore blood pressure; therapy may then be resumed. Discontinue therapy in patients whose hypotension recurs.

- Collagen vascular disease: Use perindopril with caution in patients with collagen vascular disease especially with concomitant renal impairment; may be at increased risk for hematologic toxicity. Indapamide can cause systemic lupus erythematosus (SLE) exacerbation or activation.

- Diabetes: Use indapamide with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.

- Gout: Hyperuricemia has been observed with indapamide use. In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated by indapamide.

- Hepatic impairment: Use with caution in patients with prior hepatic dysfunction. Prior to initiation of therapy obtain baseline transaminase and bilirubin levels. In cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy. Contraindicated in patients with hepatic coma.

- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations; increased cholesterol and triglyceride levels have been reported with indapamide.

- Renal artery stenosis: Use perindopril with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use with caution in pre-existing renal insufficiency; dosage adjustment may be needed. Avoid rapid dosage escalation which may lead to further renal impairment. Patients with renal impairment may be at increased risk for hematologic toxicity. Use is contraindicated in patients with progressive or severe oliguria or anuria.

Concurrent drug therapy issues:

- Drugs with QT prolongation potential: Indapamide may prolong QT interval; Concurrent use with other non-antiarrhythmic drugs known to prolong QT interval is not recommended. Use caution in patients at risk for QT prolongation, including patients with pre-existing QT interval prolongation; patients taking antiarrhythmic medications or other medications that lead to QT prolongation or other potassium-wasting medications.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Pregnancy: **ACEIs can cause injury and death to the developing fetus when used in pregnancy. ACEIs should be discontinued as soon as possible once pregnancy is detected.**

Other warnings/precautions:

- Surgery: Use with caution before, during, or immediately after major surgery. Cardiopulmonary bypass, intraoperative blood loss or vasodilating anesthesia increases endogenous renin release. Use of ACE inhibitors perioperatively will blunt angiotensin II formation and may result in hypotension.

Geriatric ConsiderationsSee individual agents.

Pregnancy Considerations**ACEIs can cause injury and death to the developing fetus when used in pregnancy. ACEIs should be discontinued as soon as possible once pregnancy is detected.** See individual agents.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions**Note:** Observed with perindopril/indapamide; also see individual agents.

1% to 10%:

Central nervous system: Dizziness (1% to 2%)

Endocrine & metabolic: Hypokalemia (4%), hyperkalemia (1%)

Gastrointestinal: Nausea (2%), vomiting (2%), dyspepsia (1%)

Respiratory: Cough (3%), upper respiratory infection (2%)

<1%, postmarketing, and/or case reports (limited to significant or life-threatening): Abdominal pain, agranulocytosis, angioedema, angina,

anxiety, arrhythmias, asthma, BUN increased, chest pain, colitis, constipation, creatinine increased, dermatitis, diarrhea, depression, drowsiness, dysuria, ECG abnormal, edema, epidermal necrolysis, epistaxis, erythema multiforme, esophagitis, fever, flushing, gout, hemoglobin decreased, hepatitis, hyperbilirubinemia, hyper-/hypotension, impotence, laryngitis, limb pain, migraine, neutropenia, oliguria, orthostatic hypotension, palpitation, polyuria, pruritus, rash, renal impairment, respiratory insufficiency, rhinitis, sinusitis, somnolence, Stevens-Johnson syndrome, syncope, tachycardia, tetany, tinnitus, transaminases increased, uric acid increased, visual disturbance

Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Allopurinol: ACE Inhibitors may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. *Risk D: Consider therapy modification*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Aprotinin: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

AzaTHIOprine: ACE Inhibitors may enhance the neutropenic effect of AzaTHIOprine. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

CycloSPORINE: ACE Inhibitors may enhance the nephrotoxic effect of CycloSPORINE. *Risk D: Consider therapy modification*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Eplerenone: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ferric Gluconate: ACE Inhibitors may enhance the adverse/toxic effect of Ferric Gluconate. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Gold Sodium Thiomalate: ACE Inhibitors may enhance the adverse/toxic effect of Gold Sodium Thiomalate. An increased risk of nitritoid reactions has been appreciated. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Lithium: ACE Inhibitors may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Loop Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Salicylates: May diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Sirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Temsirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thiazide Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Trimethoprim: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsFood: Bioavailability of perindoprilat (active metabolite of perindopril) is reduced ~35% by food.

Monitoring ParametersBlood pressure; BUN, serum creatinine, and electrolytes; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsBUN, serum creatinine, and electrolytes; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Tablet:

Coversyl® Plus [CAN]: Perindopril erbumine 4 mg and indapamide 1.25 mg [not available in the U.S.]

Generic AvailableNo

ManufacturerServier Canada Inc

Mechanism of ActionSee individual agents.

Pharmacodynamics/KineticsSee individual agents.

Pharmacotherapy PearlsHealth Canada issued a Notice of Compliance, March 2007, concerning the name change of Preterax® to Coversyl® Plus LD. The new labeling and packaging is to be released at a later date.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Indapamide: Orthostatic hypotension, palpitations, flushing, rhinorrhea, and xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Index TermsIndapamide and Perindopril Erbumine; Perindopril and Indapamide

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(per IN doe pril er BYOO meen)

U.S. Brand NamesAceon®

Canadian Brand NamesApo-Perindopril®; Coversyl®

Pharmacologic CategoryAngiotensin-Converting Enzyme (ACE) Inhibitor

Use: Labeled IndicationsTreatment of hypertension; reduction of cardiovascular mortality or nonfatal myocardial infarction in patients with stable coronary artery disease

Use: Unlabeled/InvestigationalTo delay the progression of nephropathy and reduce risks of cardiovascular events in hypertensive patients with type 1 or 2 diabetes mellitus

Dosing: Adults

Hypertension: Oral: Initial: 4 mg/day but may be titrated to response; usual range: 4-8 mg/day (may be given in 2 divided doses); increase at 1- to 2-week intervals (maximum: 16 mg/day)

Concomitant therapy with diuretics: To reduce the risk of hypotension, discontinue diuretic, if possible, 2-3 days prior to initiating perindopril. If unable to stop diuretic, initiate perindopril at 2-4 mg/day and monitor blood pressure closely for the first 2 weeks of therapy, and after any dose adjustment of perindopril or diuretic.

Stable coronary artery disease: Oral: Initial: 4 mg once daily for 2 weeks; increase as tolerated to 8 mg once daily.

Heart failure (unlabeled use): Oral: Initial: 2 mg once daily; increase at 1- to 2-week intervals; target dose: 8-16 mg once daily (ACC/AHA 2005 Heart Failure Guidelines)

Dosing: Elderly

Hypertension: >65 years of age: Initial: 4 mg/day; maintenance: 8 mg/day; experience with doses >8 mg/day is limited.

Stable coronary artery disease: >70 years of age: Initial: 2 mg/day for 1 week; increase as tolerated to 4 mg/day for 1 week; then increase as tolerated to 8 mg/day; experience with doses >8 mg/day is limited.

Dosing: Renal Impairment

Cl_{cr} >30 mL/minute: Initial: 2 mg/day; maintenance dosing not to exceed 8 mg/day

Cl_{cr} <30 mL/minute: Safety and efficacy not established.

Hemodialysis: Perindopril and its metabolites are dialyzable

Dosing: Hepatic ImpairmentNo adjustment necessary.

Calculations

- Creatinine Clearance: Adults

StorageStore at room temperature of 20°C to 25°C (68°F to 77°F). Protect from moisture.

ContraindicationsHypersensitivity to perindopril, any other ACE inhibitor, or any component of the formulation; angioedema related to previous treatment with an ACE inhibitor

Allergy Considerations

- ACE Inhibitor Allergy/Hypersensitivity

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Angioedema: At any time during treatment (especially following first dose), angioedema may occur rarely with ACE inhibitors; it may involve the head and neck (potentially compromising airway) or the intestine (presenting with abdominal pain). African-Americans and patients with idiopathic or hereditary angioedema may be at an increased risk. Prolonged frequent monitoring may be required especially if tongue, glottis, or larynx are involved as they are associated with airway obstruction. Patients with a history of airway surgery may have a higher risk of airway obstruction. Aggressive early and appropriate management is critical. Use in patients with previous angioedema associated with ACE inhibitor therapy is contraindicated.

- Cholestatic jaundice: A rare toxicity associated with ACE inhibitors includes cholestatic jaundice, which may progress to fulminant hepatic necrosis; discontinue if marked elevation of hepatic transaminases or jaundice occurs.

- Cough: An ACE inhibitor cough is a dry, hacking, nonproductive one that usually occurs within the first few months of treatment and should generally resolve within 1-4 weeks after discontinuation of the ACE inhibitor. Other causes of cough should be considered (eg, pulmonary congestion in patients with heart failure) and excluded prior to discontinuation.

- Hyperkalemia: May occur with ACE inhibitors; risk factors include renal dysfunction, diabetes mellitus, concomitant use of potassium-sparing diuretics, potassium supplements and/or potassium containing salts. Use cautiously, if at all, with these agents and monitor potassium closely.

- Hypersensitivity reactions: Anaphylactic/anaphylactoid reactions can occur with ACE inhibitors. Severe anaphylactoid reactions may be seen during hemodialysis (eg, CVVHD) with high-flux dialysis membranes (eg, AN69), and rarely, during low density lipoprotein apheresis with dextran sulfate cellulose. Rare cases of anaphylactoid reactions have been reported in patients undergoing sensitization treatment with hymenoptera (bee, wasp) venom while receiving ACE inhibitors.

- Hypotension/syncope: Symptomatic hypotension with or without syncope can occur (usually with the first several doses); effects are most often observed in volume-depleted patients; correct volume depletion prior to initiation; close monitoring of patient is required especially with initial dosing and dosing increases; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. Although dose reduction may be necessary, hypotension is not a reason for discontinuation of future ACE inhibitor use especially in patients with heart failure where a reduction in systolic blood pressure is a desirable observation.

- Neutropenia/agranulocytosis: Another ACE inhibitor, captopril, has been associated with rare cases of agranulocytosis, neutropenia, or leukopenia with myeloid hypoplasia. Patients with renal impairment are at high risk of developing neutropenia. Patients with both renal impairment and collagen vascular disease (eg, systemic lupus erythematosus) are at an even higher risk of developing neutropenia. Periodically monitor CBC with differential in these patients.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

Disease-related concerns:

- Aortic stenosis: Use with caution in patients with severe aortic stenosis; may reduce coronary perfusion resulting in ischemia.

- Cardiovascular disease: Initiation of therapy in patients with ischemic heart disease or cerebrovascular disease warrants close observation due to the potential consequences posed by falling blood pressure (eg, MI, stroke). Fluid replacement, if needed, may restore blood pressure; therapy may then be resumed. Discontinue therapy in patients whose hypotension recurs.

- Collagen vascular disease: Use with caution in patients with collagen vascular disease especially with concomitant renal impairment; may be at increased risk for hematologic toxicity.

- Hypertrophic cardiomyopathy (HCM) with outflow tract obstruction: Use with caution in patients with HCM and outflow tract obstruction since reduction in afterload may worsen symptoms associated with this condition.

- Renal artery stenosis: Use with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use with caution in pre-existing renal insufficiency; dosage adjustment may be needed. Avoid rapid dosage escalation which may lead to further renal impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, ACEIs can cause injury and death to the developing fetus when used in the second and third trimesters. ACEIs should be discontinued as soon as possible once pregnancy is detected.**

Other warnings/precautions:

- Surgery: Use with caution before, during, or immediately after major surgery. Cardiopulmonary bypass, intraoperative blood loss, or vasodilating anesthesia increases endogenous renin release. Use of ACE inhibitors perioperatively will blunt angiotensin II formation and may result in hypotension.

Geriatric ConsiderationsDue to frequent decreases in glomerular filtration (also creatinine clearance) with aging, elderly patients may have exaggerated responses to ACE inhibitors; differences in clinical response due to hepatic changes are not observed. ACE inhibitors may be preferred agents in elderly patients with congestive heart failure and diabetes mellitus. Diabetic proteinuria is reduced and insulin sensitivity is enhanced. In general, the side effect profile is favorable in elderly and causes little or no CNS confusion; use lowest dose recommendations initially. Many elderly may be volume depleted due to diuretic use and/or blunted thirst reflex resulting in inadequate fluid intake.

Pregnancy Risk FactorD

Pregnancy ConsiderationsDue to adverse events observed in humans, perindopril is considered pregnancy category D. Perindopril crosses the placenta. First trimester exposure to ACE inhibitors may cause major congenital malformations. An increased risk of cardiovascular and/or central nervous system malformations was observed in one study; however, an increased risk of teratogenic events was not observed in other studies. Second and third trimester use of an ACE inhibitor is associated with oligohydramnios. Oligohydramnios due to decreased fetal renal function may lead to fetal limb contractures, craniofacial deformation, and hypoplastic lung development. The use of ACE inhibitors during the second and third trimesters is also associated with anuria, hypotension, renal failure (reversible or irreversible), skull hypoplasia, and death in the fetus/neonate. Chronic maternal hypertension itself is also associated with adverse events in the fetus/infant. ACE inhibitors are not recommended during pregnancy to treat maternal hypertension or heart failure. Those who are planning a pregnancy should be considered for other medication options if an ACE inhibitor is currently prescribed or the ACE inhibitor should be discontinued as soon as possible once pregnancy is detected. The exposed fetus should be monitored for fetal growth, amniotic fluid volume, and organ formation. Infants exposed to an ACE inhibitor *in utero*, especially during the second and third trimester, should be monitored for hyperkalemia, hypotension, and oliguria.

[U.S. Boxed Warning]: Based on human data, ACE inhibitors can cause injury and death to the developing fetus. ACE inhibitors should be discontinued as soon as possible once pregnancy is detected.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsIt is not known if perindopril is excreted in human breast milk. The manufacturer recommends that caution be exercised when administering perindopril to nursing women.

Pregnancy & Lactation, In-Depth

- Perindopril Erbumine in Pregnancy & Lactation

Adverse Reactions

>10%:

Central nervous system: Headache (24%)

Respiratory: Cough (incidence is higher in women, 3:1) (12%)

1% to 10%:

Cardiovascular: Edema (4%), chest pain (2%), ECG abnormal (2%), palpitation (1%)

Central nervous system: Dizziness (8%, less than placebo), sleep disorders (3%), depression (2%), fever (2%), nervousness (1%), somnolence (1%)

Dermatologic: Rash (2%)

Endocrine & metabolic: Hyperkalemia (1%, less than placebo), triglycerides increased (1%), menstrual disorder (1%)

Gastrointestinal: Diarrhea (4%), abdominal pain (3%), nausea (2%), vomiting (2%), dyspepsia (2%), flatulence (1%)

Genitourinary: Urinary tract infection (3%), sexual dysfunction (male 1%)

Hepatic: ALT increased (2%)

Neuromuscular & skeletal: Weakness (8%), back pain (6%), lower extremity pain (5%), upper extremity pain (3%), hypertonia (3%), paresthesia (2%), joint pain (1%), myalgia (1%), arthritis (1%), neck pain (1%)

Renal: Proteinuria (2%)

Respiratory: Upper respiratory tract infection (9%), sinusitis (5%), rhinitis (5%), pharyngitis (3%)

Otic: Tinnitus (2%), ear infection (1%)

Miscellaneous: Viral infection (3%), seasonal allergy (2%)

Note: Some reactions occurred at an incidence >1% but ≤ placebo.

<1% (Limited to important or life-threatening): Alkaline phosphatase increased, amnesia, anaphylaxis, angioedema (0.1%), anxiety, appetite increased, arthralgia, AST increased, bronchitis, bruising, cerebral vascular accident (0.2%), chills, cholesterol increased, conduction abnormalities, conjunctivitis, constipation, diaphoresis, dry skin, dyspnea, earache, epistaxis, erythema, facial edema, flank pain, fluid retention, gastroenteritis, gout, hematoma, hematuria, hyperglycemia, hypokalemia, hypotension, leukopenia, malaise, migraine, MI, murmur, nephrolithiasis, neutropenia, orthostatic hypotension, pain, pruritus, psychosexual disorder, pulmonary fibrosis (<0.1%), purpura (0.1%), rhinorrhea, serum creatinine increased, sneezing, syncope, tinea, uric acid increased, urinary frequency, urinary retention, vaginitis, vasodilation, ventricular extrasystole, vertigo, xerostomia

Additional adverse effects that have been reported with **ACE inhibitors** include agranulocytosis (especially in patients with renal impairment or collagen vascular disease), neutropenia, anemia, bullous pemphigoid, cardiac arrest, eosinophilic pneumonitis, exfoliative dermatitis, falls, hepatic failure, hyponatremia, jaundice, pancreatitis (acute), pancytopenia, pemphigus, psoriasis, thrombocytopenia; decreases in creatinine clearance in some elderly hypertensive patients or those with chronic renal failure, and worsening of renal function in patients with bilateral renal artery stenosis or hypovolemic patients (diuretic therapy). In addition, a syndrome which may include fever, myalgia, arthralgia, interstitial nephritis, vasculitis, rash, eosinophilia and positive ANA, and elevated ESR has been reported with ACE inhibitors.

Drug Interactions

Allopurinol: ACE Inhibitors may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Aprotinin: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

AzaTHIOprine: ACE Inhibitors may enhance the neutropenic effect of AzaTHIOprine. *Risk C: Monitor therapy*

CycloSPORINE: ACE Inhibitors may enhance the nephrotoxic effect of CycloSPORINE. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ferric Gluconate: ACE Inhibitors may enhance the adverse/toxic effect of Ferric Gluconate. *Risk C: Monitor therapy*

Gold Sodium Thiomalate: ACE Inhibitors may enhance the adverse/toxic effect of Gold Sodium Thiomalate. An increased risk of nitritoid reactions has been appreciated. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: ACE Inhibitors may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Loop Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Salicylates: May diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Sirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Temsirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Thiazide Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Trimethoprim: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Perindopril active metabolite concentrations may be lowered if taken with food.

Herb/Nutraceutical: Avoid bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (American), kola, licorice (may worsen hypertension). Avoid black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse (may have increased antihypertensive effect).

Monitoring ParametersBlood pressure; serum creatinine and potassium; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Nursing: Physical Assessment/MonitoringUse with caution and monitor closely in presence of with renal impairment, hypovolemia; collagen vascular diseases; valvular stenosis, hyperkalemia; or anesthesia. Assess potential for interactions with other pharmacological agents and herbal products patient may be taking (eg, other drugs may effect blood pressure or increase risk of toxicities). It is recommended that first dose is administered in prescriber's office with careful blood pressure monitoring (hypotension can occur, especially with first dose; angioedema can occur at any time during treatment, especially following first dose). Assess results of laboratory tests and patient response at beginning of therapy, when adjusting dose, and periodically with long-term therapy (eg, BP [standing and sitting], cardiac status, and fluid balance). Teach patient appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsSerum creatinine and potassium; if patient has collagen vascular disease and/or renal impairment, periodically monitor CBC with differential

Patient EducationDo not take any new medication during therapy without consulting prescriber. Take as directed; do not alter dose or discontinue without consulting prescriber. Take first dose at bedtime. Do not take potassium supplements or salt substitutes containing potassium without consulting prescriber. This drug does not eliminate need for diet or exercise regimen as recommended by prescriber. May cause increased cough (if persistent or bothersome, contact prescriber); headache (consult prescriber for approved analgesic); postural hypotension (use caution when rising from lying or sitting position or climbing stairs); dizziness (use caution when driving or engaging in tasks that require alertness until response to drug is known); nausea or vomiting (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or diarrhea (buttermilk, boiled milk, or yogurt may help). Report chest pain, respiratory difficulty or persistent cough, painful muscles or joints, rash, ringing in ears, or other persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Consult prescriber for appropriate contraceptive measures if necessary or if you suspect you might be pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 2 mg, 4 mg, 8 mg

Generic AvailableNo
ManufacturerSolvay Pharmaceuticals
Pricing: U.S. (www.drugstore.com)

Tablets (Aceon)

2 mg (100): $165.98

4 mg (100): $188.85

8 mg (100): $228.86

Mechanism of ActionPerindopril is a prodrug for perindoprilat, which acts as a competitive inhibitor of angiotensin-converting enzyme (ACE); prevents conversion of angiotensin I to angiotensin II, a potent vasoconstrictor; results in lower levels of angiotensin II which, in turn, causes an increase in plasma renin activity and a reduction in aldosterone secretion
Pharmacodynamics/Kinetics

Onset of action: Peak effect: 1-2 hours

Protein binding: Perindopril: 60%; Perindoprilat: 10% to 20%

Metabolism: Hepatically hydrolyzed to active metabolite, perindoprilat (~17% to 20% of a dose) and other inactive metabolites

Bioavailability: Perindopril: 75%; Perindoprilat ~25% (~16% with food)

Half-life elimination: Parent drug: 1.5-3 hours; Metabolite: Effective: 3-10 hours, Terminal: 30-120 hours

Time to peak: Chronic therapy: Perindopril: 1 hour; Perindoprilat: 3-7 hours (maximum perindoprilat serum levels are 2-3 times higher and T_{max} is shorter following chronic therapy); CHF: Perindoprilat: 6 hours

Excretion: Urine (75%, 4% to 12% as unchanged drug)

Related Information

- Angiotensin Agents
- Heart Failure (Systolic)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness or fatigue; may rarely cause sedation, insomnia, or depression
Mental Health: Effects on Psychiatric TreatmentMay cause neutropenia; use caution with clozapine and carbamazepine; may decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels
Cardiovascular Considerations

Congestive Heart Failure: The ACC/AHA 2005 Heart Failure Guidelines recommend that ACE inhibitors be used in patients with a reduced EF (with or without heart failure symptoms) unless contraindicated. ACE inhibitors decrease morbidity and mortality in patients with asymptomatic and symptomatic left ventricular dysfunction. In this situation, they decrease hospitalizations for, and retard progression to, congestive heart failure. When used in patients with heart failure, the target dose should be achieved, if possible. Lower daily doses of ACE inhibitors have demonstrated the same mortality effects as high doses, but have not decreased hospitalizations to the extent that high-dose ACE inhibitors have, as demonstrated in the ATLAS study (Packer M, 1999).

Hypertension: The ALLHAT study (ALLHAT Collaborative Group, 2002) compared CV outcomes of lisinopril, amlodipine, or chlorthalidone in hypertensive patients having at least one other risk factor for coronary heart disease. Investigators found no difference between the groups on the primary outcome of fatal coronary disease or nonfatal MI. The ACC/AHA 2005 Heart Failure Guidelines suggest that ACE inhibitors or angiotensin receptor blockers (ARBs) can be beneficial in patients with hypertension and LVH without symptoms of heart failure. JNC 7 suggests that patients can benefit from treatment with an ACE inhibitor if they have hypertension **and** heart failure, acute myocardial infarction, high coronary disease risk, diabetes, chronic kidney disease, or history of stroke.

Vascular Disease: The ACC/AHA 2005 Heart Failure Guidelines suggest that ACE inhibitors can be useful in preventing heart failure in patients who have a history of atherosclerotic vascular disease, diabetes, or hypertension with associated cardiovascular risk factors. The HOPE trial (Heart Outcomes Prevention Evaluation Study Investigators, 2000) investigated the value of an ACE inhibitor (ramipril 5-10 mg daily) versus placebo in patients who had evidence of vascular disease or diabetes (one other cardiovascular risk factor) and were at least 55 years of age. Patients were excluded if they had a low ejection fraction, heart failure, or were on an ACE inhibitor. The primary outcome was a composite of death from cardiovascular cause, myocardial infarction, or stroke; 9297 patients were enrolled and randomized. Ramipril significantly reduced the risk of death from CV causes, MI, or stroke over placebo. New cases of diabetes were also reduced in the ramipril group. In the EUROPA trial, patients with stable coronary artery disease (at low risk for cardiovascular events) received perindopril or placebo and were evaluated for incidence of cardiovascular events after four years of treatment. In this randomized, placebo-controlled, prospective study, 12,218 patients received either perindopril (8 mg/day, n=6110) or placebo (n=6108) and were assessed for the primary endpoint of a cardiovascular event, defined as cardiovascular death, myocardial infarction, or cardiac arrest. The study population was well balanced with respect to baseline demographics and concomitant medication use (including beta-blockers, platelet inhibitors, antihyperlipidemics, calcium channel blockers, nitrates, and diuretics). Intent-to-treat analysis revealed that 603 (10%) of placebo patients experienced the primary endpoint of a cardiovascular event compared to 488 (8%) of perindopril-receiving patients, for a 20% relative risk reduction (p=0.0003). This result was not influenced by presence of other comorbidities (eg, diabetes, hypertension) or concomitant beta-blocker, calcium channel blocker, or lipid-lowering therapies. Withdrawal from the study (postrandomization) due to adverse reactions was similar between treatment groups. Number needed to treat analysis suggests that treatment of 50 patients over a 4-year period will prevent one major cardiovascular event.

Acute Coronary Syndromes: In the treatment of unstable angina/non-ST-segment elevation MI, ACE inhibitors are recommended when hypertension persists despite treatment with nitroglycerin and a beta-blocker in patients with LV systolic dysfunction or CHF and in ischemic patients with diabetes (Class I). ACE inhibitors are also recommended for all post-ACS individuals (Class IIa). According to 2004 ACC/AHA STEMI guidelines, an ACE inhibitor should be administered orally within the first 24 hours of STEMI to patients with anterior infarction, pulmonary congestion, or LVEF <0.4, in the absence of hypotension or known contraindications to this class of medicines. In the emergency management of complicated STEMI, a short-acting ACEI (eg, captopril 1-6.25 mg) may be added once the patient's systolic blood pressure is >100 mm Hg and not <30 mm Hg below baseline. The VALIANT trial evaluated the effects of valsartan (target dose: 160 mg twice daily), captopril (target dose: 50 mg twice daily), and the combination (target doses: valsartan 80 mg twice daily and captopril 150 mg once daily) in a randomized, double-blind trial of patients with acute MI (0.5-10 days post-MI) complicated by left ventricular systolic dysfunction, heart failure, or both. Enrollment in the study numbered 14,703 patients and followed for a median of 24.7 months. There was no difference in the primary endpoint (all cause mortality) among the 3 groups. There was no difference in incidence of CV death, recurrent MI, or hospitalization for heart failure either. Hypotension and renal dysfunction occurred significantly more often in the valsartan group than captopril alone. Cough, rash, and taste disturbances occurred more often in the captopril group. The authors (Pfeffer MA, 2003) concluded that valsartan is as effective as captopril in patients who are at high risk for cardiovascular events after MI. Combining valsartan with captopril increased the rate of adverse events without improving survival.

Potential Adverse Events: ACE inhibitor therapy may elicit rapid increases in potassium and creatinine, especially when used in patients with bilateral renal artery stenosis. When ACE inhibition is introduced in patients with pre-existing diuretic therapy who are hypovolemic, the ACE inhibitor may induce acute hypotension. In those patients experiencing cough on an ACE inhibitor, the ACE inhibitor may be discontinued and, if necessary, ARB therapy instituted. Because of the potent teratogenic effects of ACE inhibitors, these drugs should be avoided, if possible, when treating women of childbearing potential not on effective birth control measures.

Drug Interactions: Concomitant indomethacin therapy may blunt the reduction in sitting and 24-hour ambulatory diastolic blood pressure. Use of NSAIDs should be avoided or limited, with monitoring of blood pressure control in this setting. In patients with heart failure, NSAID use may be associated with an increased risk for fluid accumulation and edema.

Permethrin

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(per METH rin)
U.S. Brand NamesA200® Lice [OTC]; Acticin®; Elimite®; Nix® [OTC]; Rid® Spray [OTC]
Canadian Brand NamesKwellada-P™; Nix®
Pharmacologic CategoryAntiparasitic Agent, Topical; Scabicidal Agent
Use: Labeled IndicationsSingle-application treatment of infestation with *Pediculus humanus capitis* (head louse) and its nits or *Sarcoptes scabiei* (scabies); indicated for prophylactic use during epidemics of lice
Dosing: Adults

Head lice: Topical: After hair has been washed with shampoo, rinsed with water and towel dried, apply a sufficient volume of creme rinse to saturate the hair and scalp; also apply behind the ears and at the base of the neck; leave on hair for 10 minutes before rinsing off with water; remove remaining nits. May repeat in 1 week if lice or nits still present; in areas of head lice resistance to 1% permethrin, 5% permethrin has been applied to clean, dry hair and left on overnight (8-14 hours) under a shower cap.

Scabies: Topical: Apply cream from head to toe; leave on for 8-14 hours before washing off with water; may reapply in 1 week if live mites appear. Time of application was limited to 6 hours before rinsing with soap and water.

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Head lice: Topical: Children >2 months: Refer to adult dosing.

Scabies: Topical: Apply cream from head to toe; leave on for 8-14 hours before washing off with water; for infants, also apply on the hairline, neck, scalp, temple, and forehead; may reapply in 1 week if live mites appear. Permethrin 5% cream was shown to be safe and effective when applied to an infant <1 month of age with neonatal scabies; time of application was limited to 6 hours before rinsing with soap and water.

Administration: TopicalAvoid contact with eyes and mucous membranes during application. Because scabies and lice are so contagious, use caution to avoid spreading or infecting oneself; wear gloves when applying

Cream rinse/lotion: Shake cream rinse well before using. Apply immediately after hair is shampooed, rinsed, and towel-dried. Apply enough to saturate hair and scalp (especially behind ears and on nape of neck). Leave on hair for 10 minutes before rinsing with water. Remove nits with fine-tooth comb. May repeat in 1 week if lice or nits are still present.

Cream: Apply from neck to toes. Bathe to remove drug after 8-14 hours. Repeat in 7 days if lice or nits are still present. Report if condition persists or infection occurs.

ContraindicationsHypersensitivity to pyrethyoid, pyrethrin, chrysanthemums, or any component of the formulation; lotion is contraindicated for use in infants <2 months of age
Warnings/Precautions

Concerns related to adverse effects:

- Skin irritation: Treatment may temporarily exacerbate the symptoms of itching, redness, and swelling.

Special populations:

- Pregnancy: Use during pregnancy only if clearly needed.

Other warnings/precautions:

- Appropriate use: For external use only.

Geriatric ConsiderationsBecause of its minimal absorption, permethrin is a drug of choice and is preferred over lindane.
Pregnancy Risk FactorB
LactationEffect on infant unknown
Adverse Reactions1% to 10%:

Dermatologic: Pruritus, erythema, rash of the scalp

Local: Burning, stinging, tingling, numbness or scalp discomfort, edema

Drug InteractionsThere are no known significant interactions.
Nursing: Physical Assessment/MonitoringAssess head, hair, and skin surfaces for presence of lice and nits. Assess knowledge/teach patient appropriate application and use and adverse symptoms to report.
Patient EducationFor external use only. Do not apply to face and avoid contact with eyes or mucous membrane. Clothing and bedding must

be washed in hot water or dry cleaned to kill nits. May need to treat all members of household and all sexual contacts concurrently. Wash all combs and brushes with permethrin and thoroughly rinse. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Cream rinse/lotion: Apply immediately after hair is shampooed, rinsed, and towel-dried. Apply enough to saturate hair and scalp (especially behind ears and on nape of neck). Leave on hair for 10 minutes before rinsing with water. Remove nits with fine-tooth comb. May repeat in 1 week if lice or nits are still present.

Cream: Apply from neck to toes. Bathe to remove drug after 8-14 hours. Repeat in 7 days if lice or nits are still present. Report if condition persists or infection occurs.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream, topical (Acticin®, Elimite®): 5% (60 g) [contains coconut oil]

Lotion, topical: 1% (59 mL)

Liquid, topical [creme rinse formulation] (Nix®): 1% (60 mL) [contains isopropyl alcohol 20%]

Solution, spray [for bedding and furniture]:

A200® Lice: 0.5% (180 mL)

Nix®: 0.25% (148 mL)

Rid®: 0.5% (150 mL)

Generic AvailableYes: Excludes spray

Pricing: U.S. (www.drugstore.com)

Cream (Acticin)

5% (60): $18.99

Cream (Elimite)

5% (60): $63.23

Mechanism of ActionInhibits sodium ion influx through nerve cell membrane channels in parasites resulting in delayed repolarization and thus paralysis and death of the pest

Pharmacodynamics/Kinetics

Absorption: <2%

Metabolism: Hepatic via ester hydrolysis to inactive metabolites

Excretion: Urine

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Antipsychotics (Conventional and Atypical): Association With an Increased Risk of Mortality in Elderly Patients Treated for Dementia-Related Psychosis - June 2008

The Food and Drug Administration (FDA) is notifying healthcare professionals that conventional antipsychotics (eg, haloperidol, fluphenazine) will now carry a similar boxed warning as atypical antipsychotics (eg, risperidone, aripiprazole) concerning an increased risk of mortality in elderly patients treated for dementia-related psychosis. Atypical antipsychotics received the boxed warning in April 2005 after study data from seven placebo-controlled trials indicated an increased risk of death in patients treated with certain atypicals for dementia-related behavioral disorders.

The FDA requirement to extend the warning to conventional antipsychotics was prompted by two recently published observational studies. Both studies revealed an increased risk of mortality in elderly patients treated with these medications. One of the two studies was a retrospective cohort study which examined 37,241 patients, ≥65 years of age, treated with antipsychotics. Of these patients, 12,882 received a conventional antipsychotic compared to 24,359 patients who received an atypical antipsychotic. All-cause mortality within the first 180 days of use was compared between the two groups. The results showed that the risk of death in patients who received a conventional-type antipsychotic was comparable to (and may be greater than) the risk of death in patients receiving an atypical. The second study was also a retrospective cohort study; it involved 27,259 matched pairs of patients, ≥66 years of age, diagnosed with dementia. Risk of death was compared in patients who received an atypical antipsychotic versus no antipsychotic, and in patients who received a conventional antipsychotic versus an atypical antipsychotic. An increased risk of death was observed in the groups receiving an atypical antipsychotic compared to no antipsychotic and also in patients receiving a conventional antipsychotic compared to patients receiving an atypical antipsychotic. This effect was seen at 30 days and persisted at 180 days, and was seen in both community-dwelling and long-term care facility patients.

The FDA believes that considering all the available evidence, conventional antipsychotics at least share a similar increased risk of death that has been observed with the use of atypical antipsychotics in elderly patients with dementia-related psychosis. The FDA is reminding practitioners that antipsychotic medications are not approved for the treatment of dementia-related psychosis. Elderly patients treated with antipsychotics, conventional or atypical, are at an increased risk of death. Practitioners prescribing antipsychotics to elderly patients for this purpose should inform the patient and their caregivers of this risk prior to prescribing.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antipsychotics

Medication Safety Issues

Sound-alike/look-alike issues:

Trilafon® may be confused with Tri-Levlen®

Pronunciation(per FEN a zeen)
Canadian Brand NamesApo-Perphenazine®
Pharmacologic CategoryAntiemetic; Antipsychotic Agent, Typical, Phenothiazine
Use: Labeled IndicationsTreatment of schizophrenia; severe nausea and vomiting
Use: Unlabeled/InvestigationalEthanol withdrawal; behavioral symptoms associated with dementia (elderly); Tourette's syndrome; Huntington's chorea; spasmodic torticollis; Reye's syndrome; psychosis; psychosis/agitation related to Alzheimer's dementia
Dosing: Adults

Schizophrenia/psychoses:

Nonhospitalized: Initial: 4-8 mg 3 times/day; reduce dose as soon as possible to minimum effective dosage (maximum: 64 mg/day)

Hospitalized: 8-16 mg 2-4 times/day (maximum: 64 mg/day)

Nausea/vomiting: Oral: 8-16 mg/day in divided doses up to 24 mg/day (maximum: 24 mg/day)

Dosing: ElderlyBehavioral symptoms associated with dementia (unlabeled use): Oral: Initial: 2-4 mg 1-2 times/day; increase at 4- to 7-day intervals by 2-4 mg/day. Increase dose intervals (bid, tid, etc) as necessary to control behavior response or side effects. Maximum daily dose: 32 mg; gradual increase (titration) and bedtime administration may prevent some side effects or decrease their severity.

Dosing: Renal ImpairmentNot dialyzable (0% to 5%)

Dosing: Hepatic ImpairmentDosage reductions should be considered in patients with liver disease although no specific guidelines are available.

StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F). Protect from light.

ContraindicationsHypersensitivity to perphenazine or any component of the formulation (cross-reactivity between phenothiazines may occur); severe CNS depression (comatose or patients receiving large doses of CNS depressants); subcortical brain damage; bone marrow suppression; blood dyscrasias; liver damage

Allergy Considerations

- Phenothiazine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Altered cardiac conduction: May alter cardiac conduction (life-threatening arrhythmias have occurred with therapeutic doses of phenothiazines).
- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems. Relative to other neuroleptics, perphenazine has a low potency of cholinergic blockade.
- Blood dyscrasias: Check blood counts periodically and discontinue at first signs of blood dyscrasias; use is contraindicated in patients with bone marrow suppression.
- Esophageal dysmotility/aspiration: Antipsychotic use has been associated with esophageal dysmotility and aspiration; use with caution in patients at risk of pneumonia (eg, Alzheimer's disease).
- Extrapyramidal symptoms (EPS): May cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia (risk of these reactions is moderate-high relative to other neuroleptics). Risk of dystonia (and possibly other EPS) may be greater with increased doses, use of conventional antipsychotics, males, and younger patients.
- Neuroleptic malignant syndrome (NMS): May be associated with NMS; monitor for mental status changes, fever, muscle rigidity, and/or autonomic instability (risk may be increased in patients with Parkinson's disease or Lewy body dementia).
- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).
- Photosensitivity: May cause photosensitization; avoid prolonged exposure to sunlight.
- Pigmentary retinopathy: May be associated with pigmentary retinopathy.
- Sedation: May cause sedation, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Temperature regulation: Impaired core body temperature regulation may occur; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with severe cardiovascular disease.
- Dementia: Elderly patients with dementia-related psychosis treated with antipsychotics are at an increased risk of death compared to placebo. An increased incidence of cerebrovascular adverse events (including fatalities) has been reported in elderly patients with dementia-related psychosis. Perphenazine is not approved for this indication.
- Depression: Use with caution in patients with depression; possibility of increased risk of suicide; limit quantities of drug available until significant remission observed.
- Glaucoma: Use with caution in patients with narrow-angle glaucoma; condition may be exacerbated by cholinergic blockade. Screening is recommended.
- Hepatic impairment: Use with caution in patients with hepatic impairment; dosage adjustment may be required.
- Myasthenia gravis: Use with caution in patients with myasthenia gravis; condition may be exacerbated by cholinergic blockade.
- Parkinson's disease: Use with caution in patients with Parkinson's disease; they may be more sensitive to adverse effects.
- Prolactin-dependent tumors: Use with caution in patients with breast cancer or other prolactin-dependent tumors; elevates prolactin levels.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with respiratory disease.
- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

Concurrent drug therapy issues:

- Antiemetic effects: May mask toxicity of other drugs or conditions (eg, intestinal obstruction, Reye's syndrome, brain tumor) due to antiemetic effects.

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; increased risk for developing tardive dyskinesia.

- Poor metabolizers: Use with caution in patients with reduced functional alleles of CYP2D6. Poor metabolizers may have higher plasma concentrations at usual doses, increasing risk for adverse reactions.

Geriatric ConsiderationsAny changes in disease status in any organ system can result in behavior changes.

Many elderly patients receive antipsychotic medications for inappropriate nonpsychotic behavior. Before initiating antipsychotic medication, the clinician should investigate any possible reversible cause; any stress or stress from any disease can cause acute “confusion” or worsening of baseline nonpsychotic behavior. Most commonly acute changes in behavior are due to increases in drug dose or addition of new drug to regimen; fluid electrolyte loss; infections; and changes in environment.

In the treatment of agitated, demented, elderly patients, authors of meta-analysis of controlled trials of the response to the traditional antipsychotics (phenothiazines, butyrophenones) in controlling agitation have concluded that the use of neuroleptics results in a response rate of 18%. Clearly neuroleptic therapy for behavior control should be limited with frequent attempts to withdraw the agent given for behavior control.

Pregnancy Risk FactorC
LactationEnters breast milk/not recommended (AAP rates “of concern”)
Adverse ReactionsFrequency not defined.

Cardiovascular: Bradycardia, cardiac arrest, ECG changes, hyper-/hypotension, orthostatic hypotension, pallor, peripheral edema, sudden death, tachycardia

Central nervous system: Bizarre dreams, catatonic-like states, cerebral edema, dizziness, drowsiness, extrapyramidal symptoms (pseudoparkinsonism, akathisia, dystonias, tardive dyskinesia), faintness, headache, hyperactivity, hyperpyrexia, impairment of temperature regulation, insomnia, lethargy, neuroleptic malignant syndrome (NMS), nocturnal confusion, paradoxical excitement, paranoid reactions, restlessness, seizure

Dermatologic: Discoloration of skin (blue-gray), photosensitivity, rash

Endocrine & metabolic: Amenorrhea, breast enlargement, hyper-/hypoglycemia, galactorrhea, lactation, libido changes, gynecomastia, menstrual irregularity, parotid swelling (rare), SIADH

Gastrointestinal: Adynamic ileus, anorexia, appetite increased, constipation, diarrhea, fecal impaction, obstipation, nausea, salivation, stomach pain, vomiting, weight gain, xerostomia

Genitourinary: Bladder paralysis, ejaculatory disturbances, incontinence, polyuria, priapism, urinary retention

Hematologic: Agranulocytosis, eosinophilia, hemolytic anemia, leukopenia, pancytopenia, thrombocytopenic purpura

Hepatic: Hepatotoxicity, jaundice

Neuromuscular & skeletal: Muscle weakness, tremor

Ocular: Blurred vision, cornea and lens changes, epithelial keratopathies, glaucoma, mydriasis, myosis, pigmentary photophobia, retinopathy

Renal: Glycosuria

Respiratory: Nasal congestion

Miscellaneous: Allergic reactions, diaphoresis, systemic lupus erythematosus-like syndrome

Metabolism/Transport Effects**Substrate** of CYP1A2 (minor), 2C9 (minor), 2C19 (minor), 2D6 (major), 3A4 (minor); **Inhibits** CYP1A2 (weak), 2D6 (weak)
Drug Interactions

Acetylcholinesterase Inhibitors (Central): May enhance the neurotoxic (central) effect of Antipsychotics. Severe extrapyramidal symptoms have occurred in some patients. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: Antipsychotics may diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Analgesics (Opioid): Antipsychotic Agents (Phenothiazines) may enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antimalarial Agents: May increase the serum concentration of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Anti-Parkinson's Agents (Dopamine Agonist): Antipsychotics (Typical) may diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Beta-Blockers: Antipsychotic Agents (Phenothiazines) may enhance the hypotensive effect of Beta-Blockers. Beta-Blockers may decrease the metabolism of Antipsychotic Agents (Phenothiazines). Antipsychotic Agents (Phenothiazines) may decrease the metabolism of Beta-Blockers. **Exceptions:** Atenolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Lithium formulations: May enhance the neurotoxic effect of Antipsychotics. Lithium formulations may decrease the serum concentration of Antipsychotics. Specifically noted with chlorpromazine. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Tetrabenazine: May enhance the adverse/toxic effect of Antipsychotics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid kava kava, gotu kola, valerian, St John's wort (may increase CNS depression).

Monitoring ParametersVital signs; lipid profile, fasting blood glucose/Hgb A_{1c}, baseline liver and kidney function, CBC prior to and periodically during therapy; BMI; mental status, abnormal involuntary movement scale (AIMS), extrapyramidal symptoms (EPS)

Reference Range2-6 nmol/L

Nursing: Physical Assessment/MonitoringAssess other medications patient is taking for effectiveness and interactions. Monitor ophthalmic screening, laboratory results, therapeutic effectiveness, and adverse reactions at beginning of therapy and periodically with long-term use. Monitor blood pressure; can cause orthostatic hypotension. Initiate at lower doses and taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsBaseline liver and kidney function, CBC prior to and periodically during therapy, lipid profile, fasting blood glucose/Hgb A_{1c}; BMI

Patient EducationUse exactly as directed; do not increase dose or frequency. It may take 2-3 weeks to achieve desired results; do not discontinue without consulting prescriber. Do not take within 2 hours of any antacid. Avoid alcohol or caffeine and other prescription or OTC medications not approved by prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Avoid skin contact with medication; may cause contact dermatitis (wash immediately with warm, soapy water). You may experience excess drowsiness, restlessness, dizziness, or blurred vision (use caution driving or when engaging in tasks requiring alertness until response to drug is known); dry mouth, nausea, vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); postural hypotension (use caution climbing stairs or when changing position from lying or sitting to standing); urinary retention (void before taking medication); photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight); or decreased perspiration (avoid strenuous exercise in hot environments). Report persistent CNS effects (eg, trembling fingers, altered gait or balance, excessive sedation, seizures, unusual movements, anxiety, abnormal thoughts, confusion, personality changes); chest pain, palpitations, rapid heartbeat, severe dizziness; unresolved urinary retention or changes in urinary pattern; menstrual pattern, change in libido, or ejaculatory difficulty; vision changes; skin rash or yellowing of skin; respiratory difficulty; or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 2 mg, 4 mg, 8 mg, 16 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Perphenazine)

2 mg (60): $20.99

4 mg (60): $25.99

8 mg (60): $45.99

16 mg (60): $55.49

Mechanism of ActionPerphenazine is a piperazine phenothiazine antipsychotic which blocks postsynaptic mesolimbic dopaminergic receptors in the brain; exhibits alpha-adrenergic blocking effect and depresses the release of hypothalamic and hypophyseal hormones

Pharmacodynamics/Kinetics

Absorption: Oral: Well absorbed

Distribution: Crosses placenta

Metabolism: Extensively hepatic to metabolites via sulfoxidation, hydroxylation, dealkylation, and glucuronidation

Half-life elimination: Perphenazine: 9-12 hours; 7-hydroxyperphenazine: 10-19 hours

Time to peak, serum: Perphenazine: 1-3 hours; 7-hydroxyperphenazine: 2-4 hours

Excretion: Urine and feces

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment:

Significant hypotension may occur, especially when the drug is administered parenterally; orthostatic hypotension is due to alpha-receptor blockade, the elderly are at greater risk for orthostatic hypotension.

Tardive dyskinesia: Prevalence rate may be 40% in elderly; development of the syndrome and the irreversible nature are proportional to duration and total cumulative dose over time. Extrapyramidal reactions are more common in elderly with up to 50% developing these reactions after 60 years of age. Drug-induced Parkinson's syndrome occurs often; akathisia is the most common extrapyramidal reaction in elderly.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsMost pharmacology textbooks state that in presence of phenothiazines, systemic doses of epinephrine paradoxically decrease the blood pressure. This is the so called “epinephrine reversal” phenomenon. This has never been observed when epinephrine is given by infiltration as part of the anesthesia procedure.

Mental Health CommentPerphenazine is an intermediate-potency antipsychotic. Older antipsychotic medications (chlorpromazine, haloperidol), which do not meet specific criteria for “atypical” antipsychotics, are often referred to as typical antipsychotics. They are associated with the troubling side effect, EPS. However, it is commonly believed that in order for a drug to treat psychosis, it must block dopamine is some manner.

Common side effects include sedation and neuroleptic effect (reduced initiative, interest in the environment, and display of emotion or affect). All **typical** antipsychotics are considered to be equally effective if given in equipotent doses. An inverse relationship exists between intrinsic antimuscarinic activity and propensity to cause extrapyramidal side effects. If dystonia or pseudoparkinsonism occurs, antiparkinsonian agents should be considered. If akathisia occurs, beta-blockers (eg, propranolol), benzodiazepines, or antiparkinsonian agents should be considered. Tardive dyskinesia (TD) secondary to typical antipsychotics has an estimated incidence of 3% to 5% per year for the first 5 years of treatment. After this time period, the incidence is estimated to be 2% to 3% per year. Prevalence rates are approximately 15% to 20%. Female gender and age constitute risk factors for TD. Indeed, prevalence rates have been reported to be as high as 70% in elderly females. No specific treatment exists for TD, however, patients are often initiated on/switched to an atypical antipsychotic because of their lower incidence to cause TD and hopes of suppression.

Typical antipsychotics are usually only indicated for schizophrenia, but are generally effective for mania and psychosis and/or behavioral syndromes secondary to other mental conditions. Nonpsychiatric uses include Tourette's syndrome, Huntington's disease, and occasionally, intractable hiccups, pruritus, nausea, and vomiting.

These drugs are thought to exert their antipsychotic activity by blocking dopamine D_2 receptors in the mesolimbic dopaminergic pathway. Side effects are often related to their ability to antagonize dopamine receptors in the nigrostriatal and tuberoinfundibular pathways.

Coadministration of two or more antipsychotics does not generally improve clinical response and may increase the potential for adverse effects.

In 2008, the FDA issued a warning regarding increased mortality risk with typical **and** atypical antipsychotic drugs when used in elderly patients with dementia-related psychosis.

Anesthesia and Critical Care Concerns/Other ConsiderationsCoadministration of two or more antipsychotics does not improve clinical response and may increase the potential for adverse effects.

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Phenazopyridine may be confused with phenoxybenzamine

Pyridium® may be confused with Dyrenium®, Perdiem®, pyridoxine, pyrithione

Pronunciation(fen az oh PEER i deen)
U.S. Brand NamesAZO-Gesic® [OTC]; AZO-Standard® Maximum Strength [OTC]; AZO-Standard® [OTC]; Baridium® [OTC]; Prodium® [OTC]; Pyridium®; ReAzo [OTC]; Uristat® [OTC] [DSC]; UTI Relief® [OTC]
Canadian Brand NamesPhenazo™
Pharmacologic CategoryAnalgesic, Urinary
Use: Labeled IndicationsSymptomatic relief of urinary burning, itching, frequency and urgency in association with urinary tract infection or following urologic procedures
Dosing: Adults**Urinary analgesic:** Oral: 100-200 mg 3 times/day after meals for 2 days when used concomitantly with an antibacterial agent
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Urinary analgesic:** Oral: Children: 12 mg/kg/day in 3 divided doses administered after meals for 2 days
Dosing: Renal Impairment

Cl_{cr} 50-80 mL/minute: Administer every 8-16 hours.

Cl_{cr} <50 mL/minute: Avoid use.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Dietary ConsiderationsShould be taken after meals.
ContraindicationsHypersensitivity to phenazopyridine or any component of the formulation; kidney or liver disease; patients with a Cl_{cr} <50 mL/minute
Warnings/Precautions

Concerns related to adverse effects:

• Yellow discoloration: Drug should be discontinued if skin or sclera develop a yellow color.

Disease-related concerns:

• Renal impairment: Use with caution in patients with renal impairment; use is contraindicated in patients with a Cl_{cr} <50 mL/minute.

Special populations:

• Elderly: Use of this agent in the elderly is limited since accumulation can occur in patients with renal insufficiency.

Other warnings/precautions:

• Limitations of use: Does not treat urinary infection, acts only as an analgesic.

Geriatric ConsiderationsUse of this agent in older adults is limited since accumulation of phenazopyridine can occur in patients with renal insufficiency.
Pregnancy Risk FactorB
LactationExcretion in breast milk unknown
Adverse Reactions

1% to 10%:

Central nervous system: Headache, dizziness

Gastrointestinal: Stomach cramps

<1%: Acute renal failure, methemoglobinemia, hemolytic anemia, hepatitis, rash, skin pigmentation, vertigo

Drug InteractionsThere are no known significant interactions.
Test InteractionsPhenazopyridine may cause delayed reactions with glucose oxidase reagents (Clinistix®, Tes-Tape®); occasional false-

positive tests occur with Tes-Tape®; cupric sulfate tests (Clinitest®) are not affected; interference may also occur with urine ketone tests (Acetest®, Ketostix®) and urinary protein tests; tests for urinary steroids and porphyrins may also occur

Nursing: Physical Assessment/MonitoringAssess therapeutic effectiveness (according to rationale for use). Instruct patients with diabetes to use serum glucose monitoring (phenazopyridine may interfere with certain urine testing reagents). Teach patient appropriate use, side effects/appropriate interventions, and adverse symptoms to report..

Patient EducationTake exactly as directed. May discolor urine (orange/yellow); this is normal, but will also stain fabric. If you have diabetes, use serum glucose tests; this medication may interfere with accuracy of urine testing. Report persistent headache, dizziness, or stomach cramping. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Medication Safety Issues

Sound-alike/look-alike issues:

Bontril PDM® may be confused with Bentyl®

Pronunciation(fen dye ME tra zeen)

U.S. Brand NamesBontril PDM®; Bontril® Slow-Release

Canadian Brand NamesBontril®; Plegine®; Statobex®

Pharmacologic CategoryAnorexiant; Sympathomimetic

Use: Labeled IndicationsShort-term (few weeks) adjunct in exogenous obesity

Dosing: Adults**Appetite suppressant (short-term):** Oral:

Capsule: 105 mg once daily in the morning before breakfast

Tablet: 17.5-35 mg 2 or 3 times daily, 1 hour before meals (maximum: 70 mg 3 times/day)

Dosing: ElderlyRefer to adult dosing.

Calculations

- Body Mass Index

Administration: Oral

Capsule: Administer 30-60 minutes before morning meal

Tablet: Administer 1 hour before meals

Dietary ConsiderationsMost effective when combined with a low calorie diet and behavior modification counseling.

RestrictionsC-III

Pharmacotherapy for weight loss is recommended only for obese patients with a body mass index ≥30 kg/m^2, or ≥27 kg/m^2 in the presence of other risk factors such as hypertension, diabetes, and/or dyslipidemia or a high waist circumference; therapy should be used in conjunction with a comprehensive weight management program. Rule out organic causes of obesity (eg, untreated hypothyroidism) prior to use.

Note: Phendimetrazine is not approved for long-term use. The limited usefulness of medications in this class should be weighed against possible risks associated with their use. Consult weight loss guidelines for current pharmacotherapy recommendations.

ContraindicationsHypersensitivity or idiosyncrasy to phendimetrazine or other sympathomimetic amines or any component of the formulation; advanced arteriosclerosis, symptomatic cardiovascular disease; pulmonary hypertension; moderate and severe hypertension; hyperthyroidism; glaucoma; highly nervous or agitated states, history of drug abuse; use with other CNS stimulants; during or within 14 days following MAO inhibitor therapy

Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: Amphetamines may impair the ability to engage in potentially hazardous activities.
- Primary pulmonary hypertension (PPH): A rare, frequently fatal disease of the lungs, PPH has been found to occur with increased frequency in patients receiving some anorexigens.
- Valvular heart disease: The use of some anorexigens has been associated with the development of valvular heart disease. Avoid stimulants in patients with known serious structural cardiac abnormalities, cardiomyopathy, serious heart rhythm abnormalities, or other serious cardiac problems that could increase the risk of sudden death that these conditions alone carry.

Disease-related concerns:

- Diabetes: Use with caution in patients with diabetes mellitus; antidiabetic agent requirements may be altered with anorexigens and concomitant dietary restrictions.
- Hypertension: Use with caution in patients with hypertension and other cardiovascular conditions that might be exacerbated by increases in blood pressure or heart rate.
- Seizure disorders: Use with caution in patients with a history of seizure disorders.
- Tourette's syndrome: Use with caution in patients with Tourette's syndrome; stimulants may unmask tics.

Concurrent drug therapy issues:

- Anorexigens: Safety and efficacy have not been established for use with other weight loss medications, including over-the-counter or herbal products. Not recommended for use in patients who have used other anorectic agents within the past year.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Abuse potential: Phendimetrazine is pharmacologically related to the amphetamines, which have a high abuse potential; prolonged use may lead to dependency. Prescriptions should be written for the smallest quantity consistent with good patient care to minimize possibility of overdose.

- Discontinuation of therapy: Discontinue if satisfactory weight loss has not occurred within the first 4 weeks of treatment, or if tolerance develops.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted.
LactationExcretion in breast milk unknown/not recommended
Adverse ReactionsFrequency not defined.

Cardiovascular: Flushing, hypertension, palpitation, tachycardia

Central nervous system: Agitation, dizziness, headache, insomnia, overstimulation, psychosis, restlessness

Endocrine & metabolic: Changes in libido

Gastrointestinal: Constipation, diarrhea, nausea, stomach pain, xerostomia

Genitourinary: Dysuria, urinary frequency

Neuromuscular & skeletal: Tremor

Ocular: Blurred vision, mydriasis

Miscellaneous: Diaphoresis, tachyphylaxis

Postmarketing and/or case reports: Dilated cardiomyopathy

Drug Interactions

Alkalinizing Agents: May decrease the excretion of Amphetamines. *Risk D: Consider therapy modification*

Ammonium Chloride: May decrease the serum concentration of Amphetamines. This effect is likely due to an enhanced excretion of amphetamines in the urine. *Risk C: Monitor therapy*

Analgesics (Opioid): Amphetamines may enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Amphetamines. *Risk C: Monitor therapy*

Antihistamines: Amphetamines may diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Antipsychotics: May diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Amphetamines. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

Ethosuximide: Amphetamines may diminish the therapeutic effect of Ethosuximide. Amphetamines may decrease the serum concentration of Ethosuximide. *Risk C: Monitor therapy*

Gastrointestinal Acidifying Agents: May decrease the serum concentration of Amphetamines. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Lithium: May diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the hypertensive effect of Amphetamines. *Risk X: Avoid combination*

Methenamine: May decrease the serum concentration of Amphetamines. This effect is likely due to an enhanced excretion of amphetamines in the urine. *Risk C: Monitor therapy*

PHENobarbital: Amphetamines may decrease the serum concentration of PHENobarbital. *Risk C: Monitor therapy*

Phenytoin: Amphetamines may decrease the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the stimulatory effect of Amphetamines. Tricyclic Antidepressants may also potentiate the cardiovascular effects of Amphetamines. *Risk C: Monitor therapy*

Monitoring ParametersBaseline cardiac evaluation (for preexisting valvular heart disease, pulmonary hypertension); echocardiogram during therapy; weight, waist circumference; blood pressure

Reference Range

Adult classification of weight by BMI (kg/m^2):

- Underweight: <18.5
- Normal: 18.5-24.9
- Overweight: 25-29.9
- Obese, class I: 30-34.9
- Obese, class II: 35-39.9
- Extreme obesity (class III): ≥40

Waist circumference: In adults with a BMI of 25-34.9 kg/m^2, high-risk waist circumference is defined as:

- Men >102 cm (>40 in)
- Women >88 cm (>35 in)

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, slow release, as tartrate: 105 mg

- Bontril® Slow Release: 105 mg

Tablet, as tartrate: 35 mg

- Bontril PDM®: 35 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsule, 24-hour (Bontril Slow Release)

- 105 mg (30): $43.99

Capsule, 24-hour (Phendimetrazine Tartrate)

- 105 mg (30): $31.99

Tablets (Bontril PDM)

- 35 mg (30): $25.99

Tablets (Phendimetrazine Tartrate)

- 35 mg (90): $21.99

Mechanism of ActionPhendimetrazine is a sympathomimetic amine with pharmacologic properties similar to the amphetamines. The mechanism of action in reducing appetite appears to be secondary to CNS effects, including stimulation of the hypothalamus to release norepinephrine.

Pharmacodynamics/Kinetics

Metabolism: Forms 2 metabolites

Half-life elimination: Bontril® PDM: ~2 hours; Bontril® Slow Release: ~10 hours

Excretion: Urine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse vasoconstrictor with caution in patients taking phendimetrazine. Phendimetrazine can enhance the sympathomimetic response to epinephrine leading to potential hypertension and cardiotoxicity.

Index TermsPhendimetrazine Tartrate

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Phenelzine may be confused with phenytoin

Nardil® may be confused with Norinyl®

Pronunciation(FEN el zeen)

U.S. Brand NamesNardil®

Canadian Brand NamesNardil®

Pharmacologic CategoryAntidepressant, Monoamine Oxidase Inhibitor

Use: Labeled IndicationsSymptomatic treatment of atypical, nonendogenous, or neurotic depression

Use: Unlabeled/InvestigationalSelective mutism

Dosing: Adults**Depression:** Oral: 15 mg 3 times/day; may increase to 60-90 mg/day during early phase of treatment, then reduce dose for maintenance therapy slowly after maximum benefit is obtained. Takes 2-4 weeks for a significant response to occur.

Dosing: ElderlyOral: Initial: 7.5 mg/day; increase by 7.5-15 mg/day every 3-4 days as tolerated; usual therapeutic dose: 15-60 mg/day in 3-4 divided doses.

Dosing: Pediatric**Selective mutism (unlabeled use):** Oral: 30-60 mg/day

StorageProtect from light.

RestrictionsAn FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.

ContraindicationsHypersensitivity to phenelzine or any component of the formulation; congestive heart failure; pheochromocytoma; abnormal liver function tests or history of hepatic disease; renal disease or severe renal impairment

Concurrent use of sympathomimetics (including amphetamines, cocaine, dopamine, epinephrine, methylphenidate, norepinephrine, or phenylephrine) and related compounds (methyldopa, levodopa, phenylalanine, tryptophan, or tyrosine), as well as ophthalmic alpha$_2$-agonists (apraclonidine, brimonidine); may result in hypertensive reactions

CNS depressants, cyclobenzaprine, dextromethorphan, ethanol, meperidine, bupropion, or buspirone; may result in delirium, excitation, hyperpyrexia, seizures, and coma.

At least 2 weeks should elapse between the discontinuation of serotoninergic agents (including SNRIs, SSRIs, and tricyclics) and other MAO inhibitors and the initiation of phenelzine. At least 5 weeks should elapse between the discontinuation of fluoxetine and the initiation of phenelzine. In all cases, a sufficient amount of time must be allowed for the clearance of the serotoninergic agent and any active metabolites prior to the initiation of phenelzine.

At least 2 weeks should elapse between the discontinuation of phenelzine and the initiation of the following agents: Serotoninergic agents (including SNRIs, SSRIs, fluoxetine, and tricyclics), bupropion, buspirone, and other antidepressants.

General anesthesia, spinal anesthesia (hypotension may be exaggerated). Use caution with local anesthetics containing sympathomimetic agents. Phenelzine should be discontinued ≥10 days prior to elective surgery.

Foods high in tyramine or dopamine content; foods and/or supplements containing tyrosine, phenylalanine, tryptophan, or caffeine; may result in hypertensive reactions

Warnings/Precautions

Boxed warnings:

- Suicidal thinking/behavior: See “Major psychiatric warnings” below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor patients for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 months of therapy or during periods of dosage adjustments (increases or decreases); the patient’s family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants should be dispensed with each prescription.**Phenelzine is not FDA approved for the treatment of depression in children ≤16 years of age.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **Phenelzine is not FDA approved for the treatment of bipolar depression.**

Concerns related to adverse effects:

- Hypertensive crisis: May occur with foods/supplements high in tyramine, tryptophan, phenylalanine, or tyrosine content; treatment with phentolamine is recommended for hypertensive crisis.

- Orthostatic hypotension: May cause orthostatic hypotension; use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

Disease-related concerns:

- Diabetes: Use with caution in patients with diabetes mellitus; sensitization to the effects of insulin may occur, monitor blood glucose closely.

- Glaucoma: Use with caution in patients with glaucoma.

- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

- Thyroid dysfunction: Use with caution in patients with hyperthyroidism.

Concurrent drug therapy issues:

- High potential for interactions: Do not use with other MAO inhibitors or antidepressants. Avoid products containing sympathomimetic stimulants or dextromethorphan. Concurrent use with antihypertensive agents may lead to exaggeration of hypotensive effects.

Special populations:

- Elderly: The MAO inhibitors are effective and generally well tolerated by older patients. It is the potential interactions with tyramine or tryptophan-containing foods and other drugs, and their effects on blood pressure that have limited their use.

Other warnings/precautions:

- Appropriate use: Phenelzine is not generally considered a first-line agent for the treatment of depression; phenelzine is typically used in patients who have failed to respond to other treatments.

- Electroconvulsive therapy: May increase the risks associated with electroconvulsive therapy; consider discontinuing, when possible, prior to ECT treatment.

- Myelography: Discontinue at least 48 hours prior to myelography.

Geriatric ConsiderationsThe MAO inhibitors are effective and generally well tolerated by elderly patients. It is their potential interactions with tyramine or tryptophan-containing food and other drugs and their effects on blood pressure that have limited their use. The MAO inhibitors are usually reserved for patients who do not tolerate or respond to the traditional “cyclic” or “second generation” antidepressants. The brain activity of monoamine oxidase increases with age and even more so in patients with Alzheimer's disease. Therefore, the MAO inhibitors may have an increased role in patients with Alzheimer's disease who are depressed. Phenelzine is less stimulating than tranylcypromine.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsFrequency not defined.

Cardiovascular: Edema, orthostatic hypotension

Central nervous system: Anxiety (acute), ataxia, coma, delirium, dizziness, drowsiness, fatigue, fever, headache, hyper-reflexia, mania, seizure, sleep disturbances, twitching

Dermatologic: Pruritus, rash

Endocrine & metabolic: Decreased sexual ability (anorgasmia, ejaculatory disturbances, impotence), hypermetabolic syndrome, hypernatremia

Gastrointestinal: Constipation, weight gain, xerostomia

Genitourinary: Urinary retention

Hematologic: Leukopenia

Hepatic: Hepatitis, jaundice, necrotizing hepatocellular necrosis (rare)

Neuromuscular & skeletal: Lupus-like syndrome, myoclonia, tremor, weakness

Ocular: Blurred vision, glaucoma

Miscellaneous: Diaphoresis, transient cardiac or respiratory depression (following ECT), withdrawal syndrome (nausea, vomiting, malaise)

Respiratory: Edema (glottis)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): MAO Inhibitors may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Primarily with oral administration of phenylephrine. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha-/Beta-Agonists (Indirect-Acting): MAO Inhibitors may enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Alpha1-Agonists: MAO Inhibitors may enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Alpha2-Agonists (Ophthalmic): MAO Inhibitors may enhance the hypertensive effect of Alpha2-Agonists (Ophthalmic). *Risk X: Avoid combination*

Altretamine: May enhance the orthostatic effect of MAO Inhibitors. *Risk C: Monitor therapy*

Amphetamines: MAO Inhibitors may enhance the hypertensive effect of Amphetamines. *Risk X: Avoid combination*

Anilidopiperidine Opioids: May enhance the serotonergic effect of MAO Inhibitors. This could result in serotonin syndrome. Management: Avoid use of fentanyl (and other anilidopiperidine opioids when possible) in patients who have used a monoamine oxidase inhibitor within the past 14 days due to reports of unpredictable but severe adverse effects. *Risk D: Consider therapy modification*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Atomoxetine: MAO Inhibitors may enhance the neurotoxic (central) effect of Atomoxetine. *Risk X: Avoid combination*

Beta2-Agonists: MAO Inhibitors may enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

BuPROPion: MAO Inhibitors may enhance the neurotoxic (central) effect of BuPROPion. *Risk X: Avoid combination*

BusPIRone: May enhance the adverse/toxic effect of MAO Inhibitors. Elevated blood pressure has been reported. *Risk X: Avoid combination*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

COMT Inhibitors: May enhance the adverse/toxic effect of MAO Inhibitors. *Risk D: Consider therapy modification*

Cyclobenzaprine: May enhance the serotonergic effect of MAO Inhibitors. This could result in serotonin syndrome. *Risk X: Avoid combination*

Dexmethylphenidate: MAO Inhibitors may enhance the hypertensive effect of Dexmethylphenidate. *Risk X: Avoid combination*

Dextromethorphan: MAO Inhibitors may enhance the serotonergic effect of Dextromethorphan. This may cause serotonin syndrome. *Risk X: Avoid combination*

Levodopa: May enhance the adverse/toxic effect of MAO Inhibitors. Of particular concern is the development of hypertensive reactions when levodopa is used with nonselective MAOI. *Risk D: Consider therapy modification*

Linezolid: MAO Inhibitors may enhance the adverse/toxic effect of Linezolid. *Risk X: Avoid combination*

Lithium: MAO Inhibitors may enhance the adverse/toxic effect of Lithium. *Risk C: Monitor therapy*

Maprotiline: May enhance the adverse/toxic effect of MAO Inhibitors. *Risk X: Avoid combination*

Meperidine: MAO Inhibitors may enhance the serotonergic effect of Meperidine. This may cause serotonin syndrome. *Risk X: Avoid combination*

Methyldopa: MAO Inhibitors may enhance the adverse/toxic effect of Methyldopa. *Risk X: Avoid combination*

Methylphenidate: MAO Inhibitors may enhance the hypertensive effect of Methylphenidate. *Risk X: Avoid combination*

Mirtazapine: MAO Inhibitors may enhance the neurotoxic (central) effect of Mirtazapine. *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Propoxyphene: May enhance the adverse/toxic effect of MAO Inhibitors. Specifically, the risk of serotonin syndrome or other serotonergic adverse events may be increased. *Risk X: Avoid combination*

Rauwolfia Alkaloids: MAO Inhibitors may enhance the adverse/toxic effect of Rauwolfia Alkaloids. Existing MAOI therapy can result in paradoxical effects of added rauwolfia alkaloids (eg, excitation, hypertension). *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: MAO Inhibitors may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk X: Avoid combination*

Serotonin 5-HT1D Receptor Agonists: MAO Inhibitors may decrease the metabolism of Serotonin 5-HT1D Receptor Agonists. Management: If MAO inhibitor therapy is required, naratriptan, eletriptan or frovatriptan may be a suitable 5-HT1D agonist to employ. **Exceptions:** Eletriptan; Frovatriptan; Naratriptan. *Risk X: Avoid combination*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Serotonin/Norepinephrine Reuptake Inhibitors: MAO Inhibitors may enhance the serotonergic effect of Serotonin/Norepinephrine Reuptake Inhibitors. This may cause serotonin syndrome. *Risk X: Avoid combination*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Succinylcholine: Phenelzine may enhance the neuromuscular-blocking effect of Succinylcholine. *Risk D: Consider therapy modification*

Tetrabenazine: May enhance the adverse/toxic effect of MAO Inhibitors. *Risk X: Avoid combination*

TraMADol: May enhance the neuroexcitatory and/or seizure-potentiating effect of MAO Inhibitors. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: MAO Inhibitors may enhance the serotonergic effect of Tricyclic Antidepressants. This may cause serotonin syndrome. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (based on CNS depressant effects and potential tyramine content)

Food: Concurrent ingestion of foods rich in tyramine may cause sudden and severe high blood pressure (hypertensive crisis). Avoid tyramine-containing foods with MAO-Is. Food's freshness is also an important concern; improperly stored or spoiled food can create an environment where tyramine concentrations may increase.

Herb/Nutraceuticals: Avoid supplements containing caffeine, tyrosine, tryptophan or phenylalanine. Ingestion of large quantities may increase the risk of severe side effects (eg, hypertensive reactions, serotonin syndrome).

Monitoring ParametersBlood pressure, heart rate; diet, weight; mood (if depressive symptoms), suicidal ideation (especially during the initial months of therapy or when doses are increased or decreased)

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Monitor therapeutic effectiveness and adverse reactions at beginning of therapy and periodically with long-term use. Monitor blood pressure. Observe for clinical worsening, suicidality, and unusual behavior changes, especially during the initial few months of therapy or during dosage changes. Taper dosage slowly when discontinuing; allow 3-4 weeks between discontinuing phenelzine and starting another antidepressant. Advise patients with diabetes to monitor serum glucose closely (phenelzine may lower glucose level). Assess knowledge/teach patient appropriate use, interventions to reduce side effects (including tyramine-free diet; see Tyramine Contents of Foods list), and adverse symptoms to report.

Patient EducationTake exactly as directed; do not increase dose or frequency. It may take 2-3 weeks to achieve desired results. Avoid alcohol, caffeine, and other prescription or OTC medications not approved by prescriber. Avoid tyramine-containing foods. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience postural hypotension (use caution when climbing stairs or changing position from lying or sitting to standing); drowsiness, lightheadedness, dizziness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); anorexia, dry mouth (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); or diarrhea (buttermilk, yogurt, or boiled milk may help). If you have diabetes, monitor serum glucose closely (Nardil® may effect glucose levels). Report persistent insomnia; chest pain, palpitations, irregular or rapid heartbeat, or swelling of extremities; muscle cramping, tremors, or altered gait; blurred vision or eye pain; yellowing of eyes or skin; pale stools/dark urine; suicide ideation; or worsening of condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 15 mg

Generic AvailableNo

ManufacturerPfizer Inc

Pricing: U.S. (www.drugstore.com)

Tablets (Nardil)

15 mg (100): $61.99

Mechanism of ActionThought to act by increasing endogenous concentrations of norepinephrine, dopamine, and serotonin through inhibition of the enzyme (monoamine oxidase) responsible for the breakdown of these neurotransmitters

Pharmacodynamics/Kinetics

Onset of action: Therapeutic: 2-4 weeks; geriatric patients receiving an average of 55 mg/day developed a mean platelet MAO activity inhibition of about 85%.

Duration: May continue to have a therapeutic effect and interactions 2 weeks after discontinuing therapy

Absorption: Well absorbed

Metabolism: Oxidized via monoamine oxidase (primary pathway) and acetylation (minor pathway)

Half-life elimination: 11 hours

Excretion: Urine (primarily as metabolites and unchanged drug)

Related Information

- Antidepressant Agents
- Teratogenic Risks of Psychotropic Medications
- Tyramine Content of Foods

Pharmacotherapy PearlsPyridoxine deficiency has occurred; symptoms include numbness and edema of hands; may respond to supplementation.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Orthostatic hypotension, xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation). Avoid use as an analgesic due to toxic reactions with MAO inhibitors.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsAttempts should be made to avoid use of vasoconstrictor due to possibility of hypertensive episodes with monoamine oxidase inhibitors

Mental Health: Child/Adolescent ConsiderationsFour children 5.5-7 years of age, diagnosed with selective mutism were treated with 30-60 mg/day for 24-60 weeks (Golwyn, 1999).

Golwyn DH and Sevlie CP, "Phenelzine Treatment of Selective Mutism in Four Prepubertal Children," *J Child Adolesc Psychopharmacol*, 1999, 9(2):109-13.

Mental Health CommentNot commonly used due to a required low tyramine diet and drug-drug interactions. It is estimated that 20 mg of tranylcypromine = 40 mg of isocarboxazid = 45 mg phenelzine. Phenelzine and isocarboxazid are hydrazine MAO inhibitors and tranylcypromine is a nonhydrazine. These drugs produce irreversible inhibition of MAO inhibitors. The half-life for regeneration is 2-3 days. Therefore, a 2-week period is required when switching from an MAO inhibitor to another antidepressant.

While hypertension and hypertensive crisis are risks associated with MAO inhibitor therapy, orthostatic hypotension may also occur. Orthostasis associated with MAO inhibitor therapy is not related to alpha$_1$-adrenergic receptor blockade. The "false transmitter" concept is used to explain this side effect. This concept states that MAO inhibitors promote gradual accumulation in sympathetic nerve ending of amines lacking direct sympathomimetic activity (octopamine) at the expense of the normal synaptic transmitter, norepinephrine. Since octopamine has little ability to activate either alpha- or beta-adrenergic receptors, a functional impairment of sympathetic neurotransmission occurs.

The MAO inhibitors are usually reserved for patients who do not tolerate or respond to other antidepressants. The brain activity of monoamine oxidase increases with age and even more so in patients with Alzheimer's disease. Therefore, the MAO inhibitors may have an increased role in patients with Alzheimer's disease who are depressed. Phenelzine is less stimulating than tranylcypromine.

Anesthesia and Critical Care Concerns/Other ConsiderationsAvoid food containing tyramine. The MAO inhibitors are usually reserved for patients who do not tolerate or respond to other antidepressants.

Index TermsPhenelzine Sulfate

Pronunciation(fen IN dah meen)

U.S. Brand NamesNolahist速 [OTC] [DSC]

Canadian Brand NamesNolahist速

Pharmacologic CategoryHistamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsTreatment of perennial and seasonal allergic rhinitis and chronic urticaria

Dosing: Adults**Allergic rhinitis, urticaria:** Oral: 25 mg every 4-6 hours, up to 150 mg/24 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Allergic rhinitis, urticaria:** Oral:

Children <6 years: As directed by physician

Children 6 to <12 years: 12.5 mg every 4-6 hours, up to 75 mg/24 hours

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as tartrate: 25 mg [DSC]

Generic AvailableNo

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Special Alerts

Antiepileptics: Increased Risk of Suicidal Behavior or Ideation - Updated: December 2008

The U.S. Food and Drug Administration (FDA) has issued an update following the completion of its analysis concerning the risk of suicidality (suicidal behavior or ideation) observed during clinical trials of various antiepileptic drugs (compared to placebo) in the treatment of epilepsy, psychiatric disorders, and other conditions. The pooled analysis of 199 clinical trials involving 11 antiepileptic drugs (carbamazepine, divalproex sodium, felbamate, gabapentin, lamotrigine, levetiracetam, oxcarbazepine, pregabalin, tiagabine, topiramate, zonisamide) as either monotherapy or as adjuvant therapy showed that patients receiving an antiepileptic had a 0.43% risk of suicidal behavior/ideation compared to 0.24% of patients receiving placebo. As a result of the findings, the FDA will require that the product labeling of the entire class of antiepileptics include a warning concerning the risk of suicidality, and a medication guide be developed informing patients of this risk.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antiepileptic

Medication Safety Issues

Sound-alike/look-alike issues:

PHENobarbital may be confused with PENTobarbital

Luminal® may be confused with Tuinal®

Pronunciation(fee noe BAR bi tal)

U.S. Brand NamesLuminal® Sodium

Canadian Brand NamesPMS-Phenobarbital

Pharmacologic CategoryAnticonvulsant, Barbiturate; Barbiturate

Use: Labeled IndicationsManagement of generalized tonic-clonic (grand mal) and partial seizures; sedative

Use: Unlabeled/InvestigationalFebrile seizures in children; may also be used for prevention and treatment of neonatal hyperbilirubinemia and lowering of bilirubin in chronic cholestasis; neonatal seizures; management of sedative/hypnotic withdrawal

Dosing: Adults

Sedation: Oral, I.M.: 30-120 mg/day in 2-3 divided doses

Hypnotic: Oral, I.M., I.V., SubQ: 100-320 mg at bedtime

Preoperative sedation: I.M.: 100-200 mg 1-1.5 hours before procedure

Anticonvulsant/status epilepticus:

Loading dose: I.V.: 300-800 mg initially followed by 120-240 mg/dose at 20-minute intervals until seizures are controlled or a total dose of 1-2 g

Maintenance dose: Oral, I.V.: 1-3 mg/kg/day in divided doses or 50-100 mg 2-3 times/day

Sedative/hypnotic withdrawal (unlabeled use): Initial daily requirement is determined by substituting phenobarbital 30 mg for every 100 mg pentobarbital used during tolerance testing; then daily requirement is decreased by 10% of initial dose.

Dosing: ElderlyGeriatric patients should be started at the lowest recommended dose. Refer to adult dosing.

Dosing: Pediatric

Sedation: Oral: Children: 2 mg/kg 3 times/day

Hypnotic: I.M., I.V., SubQ: Children: 3-5 mg/kg at bedtime

Preoperative sedation: Oral, I.M., I.V.: Children: 1-3 mg/kg 1-1.5 hours before procedure

Anticonvulsant/Status epilepticus (Loading dose): I.V.: Infants and Children: 10-20 mg/kg in a single or divided dose; in select patients may administer additional 5 mg/kg/dose every 15-30 minutes until seizure is controlled or a total dose of 40 mg/kg is reached

Anticonvulsant maintenance dose: Oral, I.V.:

Infants: 5-8 mg/kg/day in 1-2 divided doses

Children:

1-5 years: 6-8 mg/kg/day in 1-2 divided doses

5-12 years: 4-6 mg/kg/day in 1-2 divided doses

>12 years: 1-3 mg/kg/day in divided doses or 50-100 mg 2-3 times/day

Dosing: Renal Impairment

Cl_{cr} <10 mL/minute: Administer every 12-16 hours.

Moderately dialyzable (20% to 50%)

Dosing: Hepatic ImpairmentIncreased side effects may occur in severe liver disease. Monitor plasma levels and adjust dose accordingly.
Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Avoid rapid I.V. administration >50 mg/minute. Avoid intra-arterial injection.
Administration: I.V. DetailParenteral solutions are highly alkaline. Avoid extravasation.

pH: 9.2-10.2

Dietary ConsiderationsVitamin D: Loss in vitamin D due to malabsorption; increase intake of foods rich in vitamin D. Supplementation of vitamin D and/or calcium may be necessary. Sodium content of injection (65 mg, 1 mL): 6 mg (0.3 mEq).
StorageProtect elixir from light. Not stable in aqueous solutions; use only clear solutions. Do not add to acidic solutions; precipitation may occur.
CompatibilityStable in dextran 6% in dextrose, dextran 6% in NS, D_5LR, $D_5{}^1/_4$NS, $D_5{}^1/_2$NS, D_5NS, D_5W, D_{10}W, LR, ${}^1/_2$NS, NS.

Y-site administration: Compatible: Enalaprilat, fosphenytoin, gatifloxacin, levofloxacin, linezolid, meropenem, propofol, sufentanil. **Incompatible:** Amphotericin B cholesteryl sulfate complex, hydromorphone.

Compatibility in syringe: Compatible: Heparin. **Incompatible:** Hydromorphone, pentazocine, ranitidine, sufentanil.

Compatibility when admixed: Compatible: Amikacin, aminophylline, calcium chloride, calcium gluconate, colistimethate, dimenhydrinate, meropenem, polymyxin B sulfate, sodium bicarbonate, thiopental, verapamil. **Incompatible:** Chlorpromazine, cimetidine, clindamycin, dimenhydrinate, diphenhydramine, droperidol, ephedrine, hydralazine, hydrocortisone sodium succinate, hydroxyzine, insulin (regular), kanamycin, levorphanol, meperidine, morphine, norepinephrine, pancuronium, penicillin G, pentazocine, phenytoin, procaine, prochlorperazine edisylate, prochlorperazine mesylate, promazine, promethazine, streptomycin, succinylcholine, vancomycin. **Variable (consult detailed reference):** Isoproterenol, metaraminol, methyldopate, norepinephrine.

Extemporaneously PreparedAn alcohol-free phenobarbital 10 mg/mL suspension can be prepared as follows: Levigate ten phenobarbital 60 mg tablets in a glass mortar into a fine powder. Mix 30 mL of Ora-Plus® and 30 mL of either Ora-Sweet® or Ora-Sweet® SF; stir vigorously. Add 15 mL of the Ora-Plus®/Ora-Sweet® (or Ora-Sweet® SF) mixture to the powder; triturate well. Transfer to a 2 ounce amber plastic bottle; qs to a final volume of 60 mL, making sure to rinse the mortar with the syrup mixture several times to ensure all drug is removed. Stable for up to 115 days at room temperature. Shake well prior to use.

May mix dose with chocolate syrup (1:1 volume) immediately before administration to mask the bitter aftertaste.

Cober M and Johnson CE, "Stability of an Extemporaneously Prepared Alcohol-Free Phenobarbital Suspension," *Am J Health Syst Pharm*, 2007, 64(6):644-6.

RestrictionsC-IV
ContraindicationsHypersensitivity to barbiturates or any component of the formulation; marked hepatic impairment; dyspnea or airway obstruction; porphyria; pregnancy
Allergy Considerations

- Aromatic Anticonvulsant Allergy/Hypersensitivity

Warnings/Precautions

Concern related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Hypotension: May cause hypotension particularly when administered intravenously; use with caution in hemodynamically unstable patients (hypotension or shock).

- Paradoxical stimulatory response: May cause paradoxical responses, including agitation and hyperactivity, particularly in acute pain and pediatric patients.

- Respiratory depression: May cause respiratory depression particularly when administered intravenously; use with caution patients with respiratory disease.

Disease-related concerns:

- Depression: Use with caution in patients with depression or suicidal tendencies.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Hypoadrenalism: Use with caution in patients with hypoadrenalism.

- Renal impairment: Use with caution in patients with renal impairment.

- Substance abuse: Use with caution in patients with a history of drug abuse; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.

Concurrent drug therapy issues:

- Sedatives: Effects with other sedative drugs or ethanol may be potentiated.

Special populations:

- Debilitated patients: Use with caution in patients who are debilitated.

- Elderly: Use with caution in the elderly; due to its long half-life and risk of dependence, phenobarbital is not recommended as a sedative in the elderly.

- Pediatrics: Use with caution in children; has been associated with cognitive deficits.

Other warnings/precautions:

- Acute pain: Do not administer to patients in acute pain.

- Withdrawal: Anticonvulsants should not be discontinued abruptly because of the possibility of increasing seizure frequency; therapy should be withdrawn gradually to minimize the potential of increased seizure frequency, unless safety concerns require a more rapid withdrawal.

Geriatric ConsiderationsUsing barbiturates in elderly may induce paradoxical stimulation, cause or aggravate depression and confusion. Due to its long half-life and risk of dependence, phenobarbital is not recommended as a sedative or hypnotic in the elderly. Interpretive guidelines from the Centers for Medicare and Medicaid Services (CMS) discourage the use of this agent as a sedative/hypnotic in long-term care residents.

Pregnancy Risk FactorD

Pregnancy ConsiderationsCrosses the placenta. Cardiac defect reported; hemorrhagic disease of newborn due to fetal vitamin K depletion may occur; may induce maternal folic acid deficiency; withdrawal symptoms observed in infant following delivery. Epilepsy itself, number of medications, genetic factors, or a combination of these probably influence the teratogenicity of anticonvulsant therapy. Benefit:risk ratio usually favors continued use during pregnancy and breast-feeding.

LactationEnters breast milk/not recommended (AAP recommends use “with caution”)

Breast-Feeding ConsiderationsSedation has been reported in nursing infants; infantile spasms may occur after weaning from breast milk. AAP recommends USE WITH CAUTION.

Adverse ReactionsFrequency not defined.

Cardiovascular: Bradycardia, hypotension, syncope

Central nervous system: Drowsiness, lethargy, CNS excitation or depression, impaired judgment, “hangover” effect, confusion, somnolence, agitation, hyperkinesia, ataxia, nervousness, headache, insomnia, nightmares, hallucinations, anxiety, dizziness

Dermatologic: Rash, exfoliative dermatitis, Stevens-Johnson syndrome

Gastrointestinal: Nausea, vomiting, constipation

Hematologic: Agranulocytosis, thrombocytopenia, megaloblastic anemia

Local: Pain at injection site, thrombophlebitis with I.V. use

Renal: Oliguria

Respiratory: Laryngospasm, respiratory depression, apnea (especially with rapid I.V. use), hypoventilation

Miscellaneous: Gangrene with inadvertent intra-arterial injection

Metabolism/Transport Effects**Substrate** of CYP2C9 (minor), 2C19 (major), 2E1 (minor); **Induces** CYP1A2 (strong), 2A6 (strong), 2B6 (strong), 2C8 (strong), 2C9 (strong), 3A4 (strong)

Drug Interactions

Acetaminophen: Barbiturates may increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Aminocamptothecin: PHENobarbital may decrease the serum concentration of Aminocamptothecin. *Risk C: Monitor therapy*

Amphetamines: May decrease the serum concentration of PHENobarbital. *Risk C: Monitor therapy*

Bendamustine: CYP1A2 Inducers (Strong) may decrease the serum concentration of Bendamustine. Concentrations of active metabolites may be increased. *Risk C: Monitor therapy*

Beta-Blockers: Barbiturates may decrease the serum concentration of Beta-Blockers. **Exceptions:** Atenolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

Calcium Channel Blockers: Barbiturates may increase the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

Carbonic Anhydrase Inhibitors: May enhance the adverse/toxic effect of Anticonvulsants (Barbiturate). Specifically, osteomalacia and rickets. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

Chloramphenicol: May decrease the metabolism of Barbiturates. Barbiturates may increase the metabolism of Chloramphenicol. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Contraceptive (Progestins): Barbiturates may diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Barbiturates may increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CycloSPORINE: Barbiturates may increase the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

CYP1A2 Substrates: CYP1A2 Inducers (Strong) may increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP2A6 Substrates: CYP2A6 Inducers (Strong) may increase the metabolism of CYP2A6 Substrates. *Risk C: Monitor therapy*

CYP2B6 Substrates: CYP2B6 Inducers (Strong) may increase the metabolism of CYP2B6 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Moderate): May decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Strong): May decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP2C8 Substrates (High risk): CYP2C8 Inducers (Highly Effective) may increase the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Substrates (High risk): CYP2C9 Inducers (Highly Effective) may increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inducers (Strong) may increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Darunavir: PHENobarbital may decrease the serum concentration of Darunavir. *Risk X: Avoid combination*

Disopyramide: Barbiturates may increase the metabolism of Disopyramide. *Risk D: Consider therapy modification*

Doxycycline: Barbiturates may decrease the serum concentration of Doxycycline. *Risk D: Consider therapy modification*

Etoposide: Barbiturates may increase the metabolism of Etoposide. *Risk C: Monitor therapy*

Etoposide Phosphate: Barbiturates may decrease the serum concentration of Etoposide Phosphate. Barbiturates may increase the metabolism, via CYP isoenzymes, of etoposide phosphate. *Risk C: Monitor therapy*

Etravirine: PHENobarbital may decrease the serum concentration of Etravirine. Management: The manufacturer of etravirine states these drugs should not be used in combination *Risk X: Avoid combination*

Felbamate: May increase the serum concentration of Barbiturates. *Risk C: Monitor therapy*

Folic Acid: May decrease the serum concentration of PHENobarbital. *Risk C: Monitor therapy*

Griseofulvin: Barbiturates may decrease the absorption of Griseofulvin. *Risk D: Consider therapy modification*

Ketorolac: May diminish the therapeutic effect of Anticonvulsants. *Risk C: Monitor therapy*

Lacosamide: PHENobarbital may decrease the serum concentration of Lacosamide. *Risk C: Monitor therapy*

LamoTRIgine: Barbiturates may increase the metabolism of LamoTRIgine. *Risk D: Consider therapy modification*

Leucovorin-Levoleucovorin: May decrease the serum concentration of PHENobarbital. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Mefloquine: May diminish the therapeutic effect of Anticonvulsants. Mefloquine may decrease the serum concentration of Anticonvulsants. Management: Mefloquine is contraindicated in persons with a history of convulsions. If anticonvulsant is being used for another indication monitor response to treatment closely, as concurrent mefloquine may decrease response to treatment. *Risk D: Consider therapy modification*

Meperidine: Barbiturates may enhance the CNS depressant effect of Meperidine. *Risk C: Monitor therapy*

Methadone: Barbiturates may increase the metabolism of Methadone. *Risk D: Consider therapy modification*

Methylfolate: May decrease the serum concentration of PHENobarbital. *Risk C: Monitor therapy*

Nilotinib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nilotinib. *Risk X: Avoid combination*

Oral Contraceptive (Estrogens): Barbiturates may diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

OXcarbazepine: PHENobarbital may decrease the serum concentration of OXcarbazepine. *Risk C: Monitor therapy*

Primidone: May enhance the adverse/toxic effect of Barbiturates. Primidone is converted to phenobarbital, and thus becomes additive with existing barbiturate therapy. *Risk C: Monitor therapy*

Propafenone: Barbiturates may increase the metabolism of Propafenone. *Risk D: Consider therapy modification*

Pyridoxine: May increase the metabolism of Barbiturates. Apparent in high pyridoxine doses (eg, 200 mg/day) *Risk C: Monitor therapy*

QuiNIDine: Barbiturates may increase the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Ranolazine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Ranolazine. *Risk X: Avoid combination*

Rifamycin Derivatives: May increase the metabolism of Barbiturates. *Risk C: Monitor therapy*

Rufinamide: May increase the serum concentration of PHENobarbital. PHENobarbital may decrease the serum concentration of Rufinamide. *Risk C: Monitor therapy*

Sorafenib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Sorafenib. *Risk D: Consider therapy modification*

Teniposide: Barbiturates may increase the metabolism of Teniposide. *Risk C: Monitor therapy*

Theophylline Derivatives: Barbiturates may increase the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Tipranavir: PHENobarbital may decrease the serum concentration of Tipranavir. Tipranavir may decrease the serum concentration of PHENobarbital. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: Barbiturates may increase the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Valproic Acid: May decrease the metabolism of Barbiturates. Barbiturates may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Barbiturates may increase the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Voriconazole: Barbiturates may decrease the serum concentration of Voriconazole. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: May cause decrease in vitamin D and calcium.

Herb/Nutraceutical: Avoid evening primrose (seizure threshold decreased). Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Test InteractionsAssay interference of LDH
Monitoring ParametersPhenobarbital serum concentrations, mental status, CBC, LFTs, seizure activity
Reference Range

Therapeutic:

Infants and children: 15-30 mcg/mL (SI: 65-129 µmol/L)

Adults: 20-40 mcg/mL (SI: 86-172 µmol/L)

Toxic: >40 mcg/mL (SI: >172 µmol/L)

Toxic concentration: Slowness, ataxia, nystagmus: 35-80 mcg/mL (SI: 150-344 µmol/L)

Coma with reflexes: 65-117 mcg/mL (SI: 279-502 µmol/L)

Coma without reflexes: >100 mcg/mL (SI: >430 µmol/L)

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Assess for history of addiction; long-term use can result in dependence, abuse, or tolerance; periodically evaluate need for continued use. **I.V.:** Monitor cardio/respiratory and CNS status; use safety precautions. Monitor effectiveness of therapy and adverse reactions. **Oral:** Monitor therapeutic effectiveness and adverse reactions at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, possible side effects, and symptoms to report.
Monitoring: Lab TestsPhenobarbital serum concentrations, CBC, LFTs
Patient EducationI.M./I.V.: Patient instructions and information are determined by patient condition and therapeutic purpose. If self-administered, use exactly as directed; do not increase dose or frequency. Drug may cause physical and/or psychological dependence. While using this medication, do not use alcohol and other prescription or OTC medications (especially pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, or loss of appetite (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or constipation (increased exercise, fluids, fruit, or fiber may help). Report skin rash or irritation; CNS changes (confusion, depression, increased sedation, excitation, headache, insomnia, or nightmares); respiratory difficulty or shortness of breath; changes in urinary pattern or menstrual pattern; muscle weakness or tremors; or difficulty swallowing or feeling of tightness in throat. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication; use appropriate contraceptive measures. Breast-feeding is not recommended.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Elixir: 20 mg/5 mL (5 mL, 7.5 mL, 15 mL, 480 mL) [contains alcohol]

Injection, solution, as sodium: 65 mg/mL (1 mL); 130 mg/mL (1 mL) [contains alcohol and propylene glycol]

Luminal® Sodium: 60 mg/mL (1 mL); 130 mg/mL (1 mL) [contains alcohol 10% and propylene glycol]

Tablet: 15 mg, 30 mg, 60 mg, 100 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Elixir (Phenobarbital)

20 mg/5 mL (473): $16.98

Tablets (Phenobarbital)

16.2 mg (100): $12.99

32.4 mg (100): $10.99

64.8 mg (100): $12.99

97.2 mg (100): $12.99

Mechanism of ActionLong-acting barbiturate with sedative, hypnotic, and anticonvulsant properties. Barbiturates depress the sensory cortex, decrease motor activity, alter cerebellar function, and produce drowsiness, sedation, and hypnosis. In high doses, barbiturates exhibit anticonvulsant activity; barbiturates produce dose-dependent respiratory depression.
Pharmacodynamics/Kinetics

Onset of action: Oral: Hypnosis: 20-60 minutes; I.V.: ~5 minutes

Peak effect: I.V.: ~30 minutes

Duration: Oral: 6-10 hours; I.V.: 4-10 hours

Absorption: Oral: 70% to 90%

Protein binding: 20% to 45%; decreased in neonates

Metabolism: Hepatic via hydroxylation and glucuronide conjugation

Half-life elimination: Neonates: 45-500 hours; Infants: 20-133 hours; Children: 37-73 hours; Adults: 53-140 hours

Time to peak, serum: Oral: 1-6 hours

Excretion: Urine (20% to 50% as unchanged drug)

Related Information

- Status Epilepticus

Pharmacotherapy PearlsInjectable solutions contain propylene glycol.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Anesthesia and Critical Care Concerns/Other ConsiderationsPhenobarbital 65 mg/mL and 130 mg/mL each contains propylene glycol 702.4 mg/mL (67.8% v/v).

Status Epilepticus: A randomized, double-blind trial (Treiman, 1998) evaluated the efficacy of four treatments in overt status epilepticus. Treatment arms were designed based upon accepted practices of North American neurologists. The treatments were: 1) lorazepam 0.1 mg/kg, 2) diazepam 0.15 mg/kg followed by phenytoin 18 mg/kg, 3) phenytoin 18 mg/kg alone, and 4) phenobarbital 15 mg/kg. Treatment was considered successful if the seizures were terminated (clinically and by EEG) within 20 minutes of start of therapy without seizure recurrence within 60 minutes from the start of therapy. Patients who failed the first treatment received a second and a third, if necessary. Patients did not receive randomized treatments after the first one but the treating physician remained blinded. Treatment success: Lorazepam 64.9%, phenobarbital 58.2%, diazepam/phenytoin 55.8%, and phenytoin alone 43.6%. Using an “intention-to-treat” analysis, there was no statistical difference between the groups. Results of subsequent treatments in patients who failed the first therapy indicated that response rate significantly dropped regardless of treatment. Aggregate response rate to the second treatment was 7.0% and third treatment 2.3%.

Medication Safety Issues

Sound-alike/look-alike issues:

Cēpastat® may be confused with Capastat®

Pronunciation(FEE nol)
U.S. Brand NamesCastellani Paint Modified [OTC]; Cepastat® Extra Strength [OTC]; Cepastat® [OTC]; Cheracol® [OTC]; Chloraseptic® Gargle [OTC]; Chloraseptic® Mouth Pain [OTC]; Chloraseptic® Pocket Pump [OTC]; Chloraseptic® Spray for Kids [OTC]; Chloraseptic® Spray [OTC]; Pain-A-Lay® [OTC]; Phenaseptic [OTC]; Phenol EZ® [OTC]; Ulcerease® [OTC]; Vicks® Formula 44® Sore Throat [OTC]
Canadian Brand NamesP & S™ Liquid Phenol
Pharmacologic CategoryAnesthetic, Topical
Use: Labeled IndicationsRelief of sore throat pain, mouth, gum, and throat irritations; antiseptic; topical anesthetic
Dosing: Adults

Sore throat: Oral:

Cēpastat® Extra Strength, Cēpastat®: Up to 2 lozenges every 2 hours as needed

Cheracol®, Pain-A-Lay® Spray: Spray directly in throat; rinse for 15 seconds then expectorate; may repeat every 2 hours

Chloraseptic®: Five sprays onto throat or affected area; may repeat every 2 hours

Chloraseptic® Gargle, Chloraseptic® Mouth Pain, Pain-A-Lay® Gargle, Ulcerease®: Gargle or swish for 15 seconds, then expectorate; may repeat every 2 hours

Antiseptic: Topical: Castellani Paint Modified: Apply small amount to affected area 1-3 times/day

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Sore throat:** Oral:

Children 2-12 years:

Chloraseptic®: Three sprays onto throat or affected area; may repeat every 2 hours

Chloraseptic® for Kids: Five sprays onto throat or affected area; may repeat every 2 hours

Children >3 year (Ulcerease®): Refer to adult dosing.

Children 6-12 years:

Cēpastat® Extra Strength: Up to 1 lozenge every 2 hours as needed (maximum: 10 lozenges/24 hours)

Cēpastat®: Up to 1 lozenge every 2 hours as needed (maximum: 18 lozenges/24 hours)

Pain-A-Lay® Gargle: Using gauze pad, apply 10 mL to affected area, or gargle or swish for 15 seconds, then expectorate

Children ≥12 years: Cēpastat® Extra Strength, Cēpastat®,Cheracol®, Pain-A-Lay® (spray/gargle), Chloraseptic® (spray/gargle), Chloraseptic® Mouth Pain: Refer to adult dosing.

Administration: OralAllow to lozenge dissolve slowly in mouth. Spray should be allowed to remain in mouth for ~15 seconds, then expectorate.
Administration: Topical Castellani Paint Modified: May stain skin and clothing; apply to clean area
StorageStore at <86°F (30°C). Protect from humidity.
Warnings/Precautions

Other warnings/precautions:

- OTC labeling: Sore throat: Not for use >7 days or if pain, redness, or irritation continues. If sore throat is severe, not for use >2 days or if followed by fever, headache, rash, nausea, or vomiting. Oral gargles and sprays should not be swallowed.

- OTC labeling: Topical antiseptic: Do not use in eyes, or apply to large areas of the body, deep or puncture wounds, animal bites or burns. Do not use for >7 days; do not bandage affected area.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Lozenge, oral:

Cēpastat®: 14.5 mg (18s) [sugar free; contains menthol; cherry flavor]

Cēpastat® Extra Strength: 29 mg (18s) [sugar free; contains menthol; eucalyptus flavor]

Solution, oral [gargle]:

Chloraseptic®: 1.4% (296 mL) [alcohol and sugar free; cool mint flavor]

Pain-A-Lay®: 1.4% (240 mL, 540 mL) [contains tartrazine]

Ulcerease®: 0.6% (180 mL) [alcohol, dye, and sugar free; contains glycerin]

Solution, oral [spray]: 1.4% (180 mL)

Cheracol®: Phenol 1.4% (180 mL) [alcohol and sugar free; contains tartrazine]

Chloraseptic®: 1.4% (180 mL) [alcohol and sugar free; cherry, cool mint, and menthol flavors]

Chloraseptic® for Kids: 0.5% (177 mL) [grape flavor]

Chloraseptic® Mouth Pain: 1.4% (30 mL) [alcohol and sugar free; cool mint flavors]

Chloraseptic® Pocket Pump: 1.4% (20 mL) [alcohol and sugar free; cherry flavor]

Pain-A-Lay®: 1.4% (180 mL) [contains tartrazine]

Phenaseptic: 1.4% (180 mL) [sugar free; cherry flavor]

Vicks® Formula 44® Sore Throat: 1.4% (180 mL) [contains glycerin; cherry ice and honey lemon ice flavors]

Solution, topical:

Castellani Paint Modified: Phenol 1.5% (30 mL) [contains alcohol 13%, acetone, basic fuchsin, resorcinol]

Castellani Paint Modified [colorless]: Phenol 1.5% (30 mL) [contains alcohol 13%, acetone, and resorcinol]

Swabs, topical:

Phenol EZ®: 89% (30s) [~0.2 mL]

Generic AvailableYes: Oral spray
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Mental Health CommentIn overdose, may cause agitation, confusion, slurred speech, and CNS depression.
Index TermsCarbolic Acid
International Brand NamesPaoscle (JP); Phenolum liquefactum (PL)

Phenoxybenzamine

Lexi-Drugs Online

English

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Phenoxybenzamine may be confused with phenazopyridine

Pronunciation(fen oks ee BEN za meen)

U.S. Brand NamesDibenzyline®

Canadian Brand NamesDibenzyline®

Pharmacologic CategoryAlpha $_1$ Blocker; Antidote

Use: Labeled IndicationsSymptomatic management of pheochromocytoma

Use: Unlabeled/InvestigationalMicturition problems associated with neurogenic bladder, functional outlet obstruction, and partial prostate obstruction; treatment of hypertensive crisis caused by sympathomimetic amines

Dosing: Adults

Pheochromocytoma, hypertension: Oral: Initial: 10 mg twice daily, increase by 10 mg every other day until optimal blood pressure response is achieved; usual range: 20-40 mg 2-3 times/day. Doses up to 240 mg/day have been reported (Kinney, 2000).

Micturition disorders (unlabeled use): Oral: 10-20 mg 1-2 times/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Pheochromocytoma, hypertension (unlabeled uses):** Oral: Initial: 0.25-1 mg/kg/day (maximum: 10 mg); increase slowly to blood pressure control

StorageStore at controlled room temperature of 25°C (77°F).

ContraindicationsHypersensitivity to phenoxybenzamine or any component of the formulation; conditions in which a fall in blood pressure would be undesirable (eg, shock)

Warnings/Precautions

Concerns related to adverse effects:

- Cardiovascular effects: An exaggerated hypotensive response and tachycardia may occur when administered concurrently with compounds that stimulate both alpha- and beta-adrenergic receptors or in the setting of pheochromocytoma. Discontinue if symptoms of severe hypotension or angina occur.

Disease-related concerns:

- Obstructive atherosclerosis: Use with caution in patients with obstructive cerebral or coronary atherosclerosis, since a marked reduction in blood pressure may induce ischemic symptoms.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory tract infection: Can exacerbate symptoms of respiratory tract infections.

Special populations:

- Elderly: Use with caution in the elderly; may be at higher risk of adverse effects.

Other warnings/precautions:

- Long-term use: Not recommended for long-term use due to case reports of cancer in humans.

Geriatric ConsiderationsBecause of the risk of adverse effects, avoid the use of this medication in the elderly if possible.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAdequate animal reproduction studies have not been conducted. It is not known whether phenoxybenzamine can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity.

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsFrequency not defined.

Cardiovascular: Postural hypotension, tachycardia

Central nervous system: Drowsiness, fatigue

Gastrointestinal: GI irritation

Genitourinary: Inhibition of ejaculation

Ocular: Miosis

Respiratory: Nasal congestion

Drug Interactions

Alfuzosin: Alpha1-Blockers may enhance the antihypertensive effect of Alfuzosin. Risk of orthostatic hypotension or syncope may be increased. Alfuzosin may enhance the antihypertensive effect of Alpha1-Blockers. *Risk X: Avoid combination*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Beta-Blockers: May enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. **Exceptions:** Levobunolol; Metipranolol. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Alpha1-Blockers may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Phosphodiesterase 5 Inhibitors: May enhance the hypotensive effect of Alpha1-Blockers. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Silodosin: Alpha1-Blockers may enhance the adverse/toxic effect of Silodosin. Of particular concern are the risk of postural hypotension, syncope, and/or hypotension. Silodosin may enhance the hypotensive effect of Alpha1-Blockers. Of particular concern are the risk of postural hypotension, syncope, and/or hypotension. *Risk X: Avoid combination*

Tamsulosin: Alpha1-Blockers may enhance the antihypertensive effect of Tamsulosin. Risk of orthostatic hypotension or syncope may be increased. Tamsulosin may enhance the antihypertensive effect of Alpha1-Blockers. *Risk X: Avoid combination*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol.

Herb/Nutraceutical: Avoid bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (American), kola, licorice, (may worsen hypertension). Avoid black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse (may have increased antihypertensive effect).

Monitoring ParametersBlood pressure, pulse, urine output, orthostatics

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as hydrochloride:

Dibenzyline®: 10 mg [contains benzyl alcohol]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Capsules (Dibenzyline)

10 mg (30): $203.94

Mechanism of ActionProduces long-lasting noncompetitive alpha-adrenergic blockade of postganglionic synapses in exocrine glands and smooth muscle; relaxes urethra and increases opening of the bladder

Pharmacodynamics/Kinetics

Duration: I.V.: ≥3 days

Bioavailability: 20% to 30%

Half-life elimination: I.V.: 24 hours

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause sedation, confusion, or dizziness

Mental Health: Effects on Psychiatric TreatmentConcurrent use with low potency antipsychotics, TCAs and MAO inhibitors may produce additive hypotension

Anesthesia and Critical Care Concerns/Other ConsiderationsHypotensive effect may last for a few days after discontinuation.

Index TermsPhenoxybenzamine Hydrochloride

Phentermine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Phentermine may be confused with phentolamine, phenytoin

Ionamin® may be confused with Imodium®

Pronunciation(FEN ter meen)

U.S. Brand NamesAdipex-P®; Ionamin®

Canadian Brand NamesIonamin®

Pharmacologic CategoryAnorexiant; Sympathomimetic

Use: Labeled IndicationsShort-term (few weeks) adjunct in exogenous obesity

Dosing: Adults**Obesity (short-term adjunct):** Oral: 18.75-37.5 mg/ day (phentermine hydrochloride) **or** 15-30 mg/day (phentermine resin)

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren >16 years: Refer to adult dosing.

Calculations

- Body Mass Index

Administration: Oral

Phentermine hydrochloride: Administer before breakfast or 1-2 hours after breakfast. Tablets may be divided in half and dose may be given in 2 divided doses. Avoid late evening administration.

Phentermine resin: Administer before breakfast or 10-14 hours before retiring. Swallow capsules whole.

Dietary ConsiderationsMost effective when combined with a low calorie diet and behavior modification counseling.

RestrictionsC-IV

Pharmacotherapy for weight loss is recommended only for obese patients with a body mass index ≥30 kg/m^2, or ≥27 kg/m^2 in the presence of other risk factors such as hypertension, diabetes, and/or dyslipidemia or a high waist circumference; therapy should be used in conjunction with a comprehensive weight management program. Rule out organic causes of obesity (eg, untreated hypothyroidism) prior to use.

Note: Phentermine is not approved for long-term use. The limited usefulness of medications in this class should be weighed against possible risks associated with their use. Consult weight loss guidelines for current pharmacotherapy recommendations.

ContraindicationsHypersensitivity or idiosyncrasy to phentermine or other sympathomimetic amines or any component of the formulation; advanced arteriosclerosis, cardiovascular disease, moderate-to-severe hypertension; pulmonary hypertension; hyperthyroidism, glaucoma, agitated states, patients with a history of drug abuse; use during or within 14 days following MAO inhibitor therapy

Allergy Considerations

- Amphetamine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: Amphetamines may impair the ability to engage in potentially hazardous activities.
- Primary pulmonary hypertension (PPH): A rare, frequently fatal disease of the lungs, PPH has been reported to occur in patients receiving a combination of phentermine and fenfluramine or dexfenfluramine. The possibility of an association between PPH and the use of phentermine alone cannot be ruled out.
- Valvular heart disease: The use of some anorexigens, including phentermine, has been associated with the development of valvular heart disease. Avoid stimulants in patients with known serious structural cardiac abnormalities, cardiomyopathy, serious heart rhythm abnormalities, or other serious cardiac problems that could increase the risk of sudden death that these conditions alone carry.

Disease-related concerns:

- Diabetes: Use with caution in patients with diabetes mellitus; antidiabetic agent requirements may be altered with anorexigens and concomitant dietary restrictions.
- Hypertension: Use with caution in patients with hypertension and other cardiovascular conditions that might be exacerbated by

increases in blood pressure or heart rate.

- Seizure disorders: Use with caution in patients with a history of seizure disorders.

- Tourette's syndrome: Use with caution in patients with Tourette's syndrome; stimulants may unmask tics.

Concurrent drug therapy issues:

- Anorexigens: Safety and efficacy have not been established for use with other weight loss medications, including over-the-counter or herbal products. Not recommended for use in patients who have used other anorectic agents within the past year.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children ≤16 years of age.

Other warnings/precautions:

- Abuse potential: Phentermine is pharmacologically related to the amphetamines, which have a high abuse potential; prolonged use may lead to dependency. Prescriptions should be written for the smallest quantity consistent with good patient care to minimize possibility of overdose.

- Discontinuation of therapy: Discontinue if satisfactory weight loss has not occurred within the first 4 weeks of treatment, or if tolerance develops.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted.
Adverse ReactionsFrequency not defined.

Cardiovascular: Hypertension, palpitation, primary pulmonary hypertension and/or regurgitant cardiac valvular disease, tachycardia

Central nervous system: Dizziness, dysphoria, euphoria, headache, insomnia, overstimulation, psychosis, restlessness

Dermatologic: Urticaria

Endocrine & metabolic: Changes in libido

Gastrointestinal: Constipation, diarrhea, unpleasant taste, xerostomia

Genitourinary: Impotence

Neuromuscular & skeletal: Tremor

Drug Interactions

Alkalinizing Agents: May decrease the excretion of Amphetamines. *Risk D: Consider therapy modification*

Ammonium Chloride: May decrease the serum concentration of Amphetamines. This effect is likely due to an enhanced excretion of amphetamines in the urine. *Risk C: Monitor therapy*

Analgesics (Opioid): Amphetamines may enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Amphetamines. *Risk C: Monitor therapy*

Antihistamines: Amphetamines may diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Antipsychotics: May diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Amphetamines. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

Ethosuximide: Amphetamines may diminish the therapeutic effect of Ethosuximide. Amphetamines may decrease the serum concentration of Ethosuximide. *Risk C: Monitor therapy*

Gastrointestinal Acidifying Agents: May decrease the serum concentration of Amphetamines. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Lithium: May diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the hypertensive effect of Amphetamines. *Risk X: Avoid combination*

Methenamine: May decrease the serum concentration of Amphetamines. This effect is likely due to an enhanced excretion of amphetamines in the urine. *Risk C: Monitor therapy*

PHENobarbital: Amphetamines may decrease the serum concentration of PHENobarbital. *Risk C: Monitor therapy*

Phenytoin: Amphetamines may decrease the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the stimulatory effect of Amphetamines. Tricyclic Antidepressants may also potentiate the cardiovascular effects of Amphetamines. *Risk C: Monitor therapy*

Monitoring Parameters Weight, waist circumference; blood pressure

Reference Range

Adult classification of weight by BMI (kg/m^2):

Underweight: <18.5

Normal: 18.5-24.9

Overweight: 25-29.9

Obese, class I: 30-34.9

Obese, class II: 35-39.9

Extreme obesity (class III): ≥40

Waist circumference: In adults with a BMI of 25-34.9 kg/m^2, high-risk waist circumference is defined as:

Men >102 cm (>40 in)

Women >88 cm (>35 in)

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as hydrochloride: 15 mg, 30 mg, 37.5 mg

Adipex-P®: 37.5 mg

Capsule, resin complex:

Ionamin®: 15 mg

Tablet, as hydrochloride: 37.5 mg

Adipex-P®: 37.5 mg

Generic Available Yes: Capsule (excludes resin complex capsule), tablet

Pricing: U.S. (www.drugstore.com)

Capsules (Adipex-P)

37.5 mg (30): $62.99

Capsules (Phentermine HCl)

15 mg (30): $40.99

30 mg (30): $34.99

37.5 mg (30): $29.99

Capsules (Phentermine Resin Complex)

15 mg (30): $29.99

Tablets (Adipex-P)

37.5 mg (30): $61.94

Tablets (Phentermine HCl)

37.5 mg (30): $29.99

Mechanism of Action Phentermine is a sympathomimetic amine with pharmacologic properties similar to the amphetamines. The mechanism of action in reducing appetite appears to be secondary to CNS effects, including stimulation of the hypothalamus to release norepinephrine.

Pharmacodynamics/Kinetics

Duration: Resin produces more prolonged clinical effects

Absorption: Well absorbed; resin absorbed slower

Excretion: Primarily urine

Related Information

- Obesity Treatment Guidelines for Adults

Dental Health Professional Considerations Many diet physicians have prescribed fenfluramine ("fen") and phentermine ("phen"). When taken together the combination is known as "fen-phen". The diet drug dexfenfluramine (Redux®) is chemically similar to fenfluramine (Pondimin®) and was also used in combination with phentermine called "Redux-phen". While each of the three drugs alone had approval from the FDA for sale in the treatment of obesity, neither combination had an official approval. The use of the combinations in the treatment of obesity was considered an “off-label” use. Reports in medical literature have been accumulating for some years about significant side effects associated with fenfluramine and dexfenfluramine. In 1997, the manufacturers, at the urging of the FDA, agreed to voluntarily withdraw the drugs from the market. The action was based on findings from physicians who evaluated patients taking fenfluramine and dexfenfluramine with echocardiograms. The findings indicated that approximately 30% of patients had abnormal echocardiograms, even though they had no symptoms. This was a much higher than expected percentage of abnormal test results. This conclusion was based on a sample of 291 patients examined by five different physicians. Under normal conditions, fewer than 1% of patients would be expected to show signs of heart valve disease. The findings suggested that fenfluramine and dexfenfluramine were the likely cause of heart valve problems of the type that promoted FDA's earlier warnings concerning “fen-phen”. The earlier warning included the following: The mitral valve and other valves in the heart are damaged by a strange white coating and allow blood to flow back, causing heart muscle damage. In several cases, valve replacement surgery has been done. As a rule, the person must, thereafter for life, be on a blood thinner to prevent clots from the mechanical valve. This type of valve damage had only been seen before in persons who were exposed to large amounts of serotonin. The fenfluramine increases the availability of serotonin.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation) and unpleasant taste. Up to 10% of patients may present with hypertension. The use of local anesthetic without vasoconstrictor is recommended in these patients. See Dental Comment.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse vasoconstrictor with caution in patients taking phentermine. Amphetamines enhance the sympathomimetic response of epinephrine and norepinephrine leading to potential hypertension and cardiotoxicity.

Cardiovascular ConsiderationsPhentermine should be avoid in patients with cardiovascular disease. The combination with fenfluramine (Phen-Fen® - no longer available) was associated with mitral valve fibrosis and mitral regurgitation. Primary pulmonary hypertension has also been reported in patients receiving Phen-Fen®.

Index TermsPhentermine Hydrochloride

U.S. Brand NamesOraVerse™

Canadian Brand NamesRegitine®; Rogitine®

Pharmacologic CategoryAlpha $_1$ Blocker

Use: Labeled IndicationsDiagnosis of pheochromocytoma and treatment of hypertension associated with pheochromocytoma or other forms of hypertension caused by excess sympathomimetic amines; as treatment of dermal necrosis after extravasation of drugs with alpha-adrenergic effects (norepinephrine, dopamine, epinephrine)

OraVerse™: Reversal of soft tissue anesthesia and the associated functional deficits resulting from a local dental anesthetic containing a vasoconstrictor

Use: Unlabeled/InvestigationalTreatment of pralidoxime-induced hypertension

Use: DentalReversal of soft tissue anesthesia and the associated functional deficits resulting from a local dental anesthetic containing a vasoconstrictor

Dosing: Adults

Treatment of alpha-adrenergic drug extravasation: SubQ:

Infiltrate area with a small amount (eg, 1 mL) of solution (made by diluting 5-10 mg in 10 mL of NS) within 12 hours of extravasation; do not exceed 0.1-0.2 mg/kg or 5 mg total

If dose is effective, normal skin color should return to the blanched area within 1 hour.

Diagnosis of pheochromocytoma: I.M., I.V.: 5 mg

Surgery for pheochromocytoma: Hypertension: I.M., I.V.: 5 mg given 1-2 hours before procedure and repeated as needed every 2-4 hours

Hypertensive crisis: I.V.: 5-20 mg

Reversal of soft tissue (lip, tongue) anesthesia (OraVerse™): Infiltration or block technique: Submucosal oral injection: **Note:** Dose is based upon the number of cartridges of local anesthetic administered. Infiltration or block injection:

0.2 mg if one-half cartridge of anesthesia was administered

0.4 mg if 1 cartridge of anesthesia was administered

0.8 mg if 2 cartridges of anesthesia were administered

Treatment of pralidoxime-induced hypertension (unlabeled use): I.V.: 5 mg

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Treatment of alpha-adrenergic drug extravasation: SubQ: Infiltrate area with a small amount (eg, 1 mL) of solution (made by diluting 5-10 mg in 10 mL of NS) within 12 hours of extravasation; do not exceed 0.1-0.2 mg/kg or 5 mg total

Diagnosis of pheochromocytoma: I.M., I.V.: 0.05-0.1 mg/kg/dose, maximum single dose: 5 mg

Surgery for pheochromocytoma: Hypertension: I.M., I.V.: 0.05-0.1 mg/kg/dose given 1-2 hours before procedure; repeat as needed every 2-4 hours until hypertension is controlled; maximum single dose: 5 mg.

Treatment of pralidoxime-induced hypertension (unlabeled use): I.V.: 1 mg

Reversal of soft tissue (lip, tongue) anesthesia (OraVerse™): Infiltration or block technique: Submucosal oral injection:

Children: 15-30 kg: 0.2 mg maximum dose

Children >30 kg and <12 years: 0.4 mg maximum dose

Administration: I.V.

Vasoconstrictor (alpha-adrenergic agonist) extravasation: Infiltrate the area of extravasation with multiple small injections using only 27- or

30-gauge needles and changing the needle between each skin entry. Be careful not to cause so much swelling of the extremity or digit that a compartment syndrome occurs. If infiltration is severe, may also need to consult vascular surgeon.

Pheochromocytoma: Inject each 5 mg over 1 minute.

Administration: I.V. DetailpH: 4.5-6.5
StorageReconstituted solution is stable for 48 hours at room temperature and 1 week when refrigerated.

OraVerse™: Store at 20°C to 25°C (68°F to 77°F); excursions permitted between 15°C to 30°C (59°F to 86°F).

CompatibilityStable in NS.

Y-site administration: Compatible: Amiodarone.

Compatibility in syringe: Compatible: Papaverine.

Compatibility when admixed: Compatible: Dobutamine, verapamil.

ContraindicationsHypersensitivity to phentolamine or any component of the formulation; renal impairment; coronary or cerebral arteriosclerosis; concurrent use with phosphodiesterase-5 (PDE-5) inhibitors including sildenafil (>25 mg), tadalafil, or vardenafil

OraVerse™: There are no contraindications listed in the manufacturer's labeling.

Warnings/Precautions

Concerns related to adverse effects:

- Angina: Discontinue if symptoms of angina occur or worsen.
- Vascular events: Following administration myocardial infarction, cerebrovascular spasm and cerebrovascular occlusion have occurred.

Disease-related concerns:

- Cardiac arrhythmias: Use with caution in patients with tachycardia or a history of cardiac arrhythmias.
- Gastrointestinal disease: Use with caution in patients with gastritis or peptic ulcer disease.

Special populations:

Pediatrics: OraVerse™: Efficacy has not been established in children <6 years of age or <15 kg (33 pounds).

Pregnancy Risk FactorC
LactationExcretion in breast milk unknown
Adverse ReactionsFrequency not always defined.

Cardiovascular: Arrhythmia, flushing, hypertension (OraVerse™), hypotension, orthostatic hypotension, tachycardia (OraVerse™ ≤6%), bradycardia (OraVerse™ ≤4%)

Central nervous system: Dizziness, headache (OraVerse™ ≤6%)

Dermatologic: Pruritus (OraVerse™)

Gastrointestinal: Nausea, vomiting, diarrhea

Local: Injection site pain (OraVerse™ 4% to 6%)

Neuromuscular & skeletal: Paresthesia (OraVerse™), weakness

Respiratory: Nasal congestion

Postmarketing and/or case reports: Pulmonary hypertension

Drug Interactions

Alfuzosin: Alpha1-Blockers may enhance the antihypertensive effect of Alfuzosin. Risk of orthostatic hypotension or syncope may be increased. Alfuzosin may enhance the antihypertensive effect of Alpha1-Blockers. *Risk X: Avoid combination*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Beta-Blockers: May enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. **Exceptions:** Levobunolol; Metipranolol. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Alpha1-Blockers may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Phosphodiesterase 5 Inhibitors: May enhance the hypotensive effect of Alpha1-Blockers. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Silodosin: Alpha1-Blockers may enhance the adverse/toxic effect of Silodosin. Of particular concern are the risk of postural hypotension, syncope, and/or hypotension. Silodosin may enhance the hypotensive effect of Alpha1-Blockers. Of particular concern are the risk of postural hypotension, syncope, and/or hypotension. *Risk X: Avoid combination*

Tamsulosin: Alpha1-Blockers may enhance the antihypertensive effect of Tamsulosin. Risk of orthostatic hypotension or syncope may be increased. Tamsulosin may enhance the antihypertensive effect of Alpha1-Blockers. *Risk X: Avoid combination*

Yohimbine: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Test InteractionsIncreased LFTs rarely

Monitoring ParametersBlood pressure, heart rate; area of infiltration; monitor patient for orthostasis; assist with ambulation

Nursing: Physical Assessment/MonitoringSee Dosing and Administration for specifics according to purpose for use. When used to treat dermal necrosis after extravasation of drugs with alpha-adrenergic effects, monitor effectiveness of treatment closely. Assess patient response (eg, cardiac status). Teach patient adverse symptoms to report.

Patient EducationThis medication can only be administered by infusion or injection. Report immediately any pain at infusion/injection site. May cause orthostatic hypotension (use caution when changing position or call for assistance). Report dizziness, rapid heartbeat, feelings of weakness, or nausea/vomiting. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as mesylate: 5 mg

Injection, solution, as mesylate [preservative free]:

OraVerse™: 0.4 mg/1.7 mL (1.7 mL) [contains edetate disodium; dental cartridge]

Generic AvailableYes

Mechanism of ActionCompetitively blocks alpha-adrenergic receptors to produce brief antagonism of circulating epinephrine and norepinephrine to reduce hypertension caused by alpha effects of these catecholamines; also has a positive inotropic and chronotropic effect on the heart

OraVerse™: Causes vasodilation and increased blood flow in injection area via alpha-adrenergic blockade to accelerate reversal of soft tissue anesthetic

Pharmacodynamics/Kinetics

Onset of action: I.M.: 15-20 minutes; I.V.: Immediate

Peak effect: OraVerse™: 10-20 minutes

Duration: I.M.: 30-45 minutes; I.V.: 15-30 minutes

Metabolism: Hepatic

Half-life elimination: 19 minutes

Excretion: Urine (10% as unchanged drug)

Related Information

- Hypertension

Dental Health Professional ConsiderationsOraVerse™ (solution for injection/dental cartridge) is administered as a submucosal injection and is not to be confused with phentolamine used as an intramuscular or intravenous injection for the treatment of hypertension associated with pheochromocytoma.

In adolescents >12 years and adults, OraVerse™ reduced the median time to recovery of normal sensation in the lower lip by 85 minutes compared to control. OraVerse™ reduced the median time to recovery of normal sensation in the upper lip by 83 minutes. Within 1 hour after administration, 41% of patients reported normal lower lip sensation as compared to 7% in the control group and 59% of patients given OraVerse™ reported normal upper lip sensation as compared to 12% in the control group.

In children 6-11 years of age, the median time to normal sensation was reduced by 75 minutes after OraVerse™ administration, a 56% acceleration of the time to normal sensation.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: The most common reaction that was greater than controls was injection site pain (~4% to 6%). A few incidences of paresthesia associated with OraVerse™ have been reported. These incidences were mild and transient, and resolved during the same time period. Orthostatic hypotension has also been reported.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsAlthough the alpha-adrenergic blocking effects could antagonize epinephrine, there is no information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive hypotension; treatment of choice for hypertensive crisis secondary to MAO inhibitors

Index Terms Phentolamine Mesylate; Regitine [DSC]

Children >6 years: 5-10 mL every 12 hours

StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F).

ContraindicationsHypersensitivity to phenylephrine, pyrilamine, or any component of the formulation; asthma; hypertension or peripheral vascular insufficiency; use with or within 14 days of MAO inhibitors; newborns; breast-feeding

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease; contraindicated in patients with hypertension.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or glaucoma.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or urinary obstruction.
- Pyloroduodenal obstruction: Use with caution in patients with pyloroduodenal obstruction (including stenotic peptic ulcer).
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Antihistamines may cause excitation in young children.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted with this combination. Phenylephrine may cause fetal anoxia or bradycardia if administered late in pregnancy or during labor. Sympathomimetics may cause minor malformations when used during the first trimester.

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsSpecific information for phenylephrine or pyrilamine is not available, however, infants may be more sensitive to the effects of antihistamines.

Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmias, hyper-/hypotension, palpitation

Central nervous system: Coordination disturbed, drowsiness, dysphoria, euphoria, headache, insomnia, irritability, nervousness, sedation, seizure

Dermatologic: Photosensitivity, pruritus, rash, urticaria

Gastrointestinal: Anorexia, constipation, diarrhea, epigastric discomfort, nausea, vomiting, xerostomia

Genitourinary: Difficult urination, urinary frequency

Hematologic: Agranulocytosis, hemolytic anemia, thrombocytopenia

Neuromuscular & skeletal: Tremor, weakness

Ocular: Visual disturbances

Respiratory: Shortness of breath, wheezing

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Nursing: Physical Assessment/MonitoringSee individual agent for Phenylephrine.

Patient EducationSee individual agent for Phenylephrine.

Viravan®: Phenylephrine tannate 25 mg and pyrilamine tannate 30 mg [dye free; grape flavor] [DSC]

Generic AvailableYes: Suspension, tablet

Pricing: U.S. (www.drugstore.com)

Suspension (Ryna-12 S)

30-5 mg/5 mL (118): $74.79

Mechanism of Action

Phenylephrine hydrochloride is a sympathomimetic agent (primarily alpha), decongestant.

Pyrilamine is an H_1-receptor antagonist.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since phenylephrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental StatusMay cause sedation, dysphoria, euphoria, insomnia, anxiety, excitability, nervousness, fatigue, or depression

Mental Health: Effects on Psychiatric TreatmentContraindicated with MAO inhibitors. Concurrent use with psychotropic agents may result in additive sedative and/or anticholinergic effects; monitor. May cause seizures; monitor in patients receiving clozapine. May rarely be associated with agranulocytosis; use caution with clozapine, carbamazepine, and mirtazapine. May cause thrombocytopenia; monitor in patients receiving valproic acid.
